May I suggest to gardeners in other parts of Yorkshire, that, if the matter has not already been taken in hand, some such plan should be adopted, as the result, I am sure, would be a birthday gift worthy of Yorkshire gardeners, and would probably arouse an interest which would also have the effect of increasing in future the number of annual subscribers to this worthy institution. Any living in a district where no collection is being made who would like to contribute, and so swell the amount from Yorkshire, are asked to send their subscriptions to Mr. [illegible]man, The Elms, Weetwood, Leeds; Mr. [illegible] Coates, Spring Bank, Headingly, Leeds; Mr. [illegible] Wellwood, Wyther House, Kirkstall, Leeds; Mr. Waltham, Sandy Wood, Horsforth, [illegible] Leeds; or to yours faithfully, [illegible] CARVER, Chapel Allerton, Leeds.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

GARDENERS' ORPHAN FUND.—Abies: The secretary of the Royal Gardeners' Orphan Fund is Mr. Brian Wynne, and his address is 30, Wellington Street, Covent Garden, W.C.

WISLEY STUDENTS.—M. E. B., Windsor: The Royal Horticultural Society admits a limited number of young men, not exceeding 22 years of age, to study gardening at Wisley, where the training has been recently further developed by the erection of the laboratory and research station. The curriculum now includes not only practical garden work in all the main branches of horticulture, but also lectures, demonstrations, and elementary horticultural science in the laboratory, whereby a practical knowledge of simple garden chemistry, biology, etc., may be obtained. The laboratory is equipped with the best apparatus procurable for students. The training extends over a period of two years, with a progressive course for each year. Students can only enter at the end of September and at the end of March. Selected students have also the advantage of attending certain of the society's shows and lectures in London. It is generally easy to find these young men employment on the completion of their training, in fact the council are quite unable to meet the demand for energetic, trustworthy young men, but they must all be workers.

PIGEON AND DOVE ORCHIDS.—L. N. D., Walsall: The pigeon orchid is Dendrobium crumenatum, and the dove orchid is Peristeria alata.

GARDEN CACTUS DAHLIAS.—N. S. G., Ipswich: We have previously drawn attention to this matter. As a result of trials and comparisons the committee of the National Dahlia Society has put forward the following as the best twenty varieties of cactus dahlias to make an especially effective display in the garden on account of their good habit of growth and stiff flower stems: A. D. Stoop, Amos Perry, Alexander, Beacon, Dainty, D. A. Dunbar, Eclair, Eve, Florence M. Stredwick, Glow, Lustre, Meteor, Mrs. F. Grinsted, Mrs. H. L. Brousson, Mrs. J. S. Brunton, Oscar, Pearl, Primrose, and Star.

SEEDLING WINTER-FLOWERING CARNATIONS.—F. T., Bristol: Raisers of seedling winter-flowering carnations should ever keep in view the winter-flowering habit of the plants. There is, no doubt, room for a race of perpetual summer-flowering varieties, and, indeed, the race may be said to have already come into existence, but one can hardly regard a variety that is at its best in July as worthy of inclusion as a winter-flowering one. Taking, for instance, a variety like Enchantress as a standard of perfection, the following scale of points should be applied to a new seedling to find how far it comes short of the standard: Colour, size, fragrance, substance, calyx, general appearance, length and substance of stem, and habit of plant; five points to each as a maximum. The Winter-flowering Carnation Society only grants a certificate to a variety gaining 30 points or upwards, and an Award of Merit to varieties gaining 25 to 29 points.

SWEET PEA CULTURE.—R. S., Stoke: We can heartily recommend "Sweet Peas and their Cultivation," 1s. 2d., or 1s. 8d. cloth bound (post free), from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.

HYDRANGEA HORTENSIA.—F. G. C., Cheriton: The best known and most generally cultivated of the several species of hydrangea is Hydrangea Hortensia, which was introduced from China at the end of the eighteenth century. Fully half a century ago it was one of the most popular of flowering plants for decorative purposes; but at no time has it enjoyed so high a degree of popularity as now. It is grown in enormous quantities in the market gardens in the neighbourhood of London, and sent to Covent Garden during the spring and summer months. The plants are, for the most part, grown in five-inch pots, some occupy pots one size larger, but they are all grown with a single stem each, and bear immense heads of the charming pink flowers. In the open this hydrangea can only be successfully grown and flowered in kind climates, such as those of the southern and western counties of England, and in the warmer parts of Ireland. Where the climate is sufficiently mild to admit of it being cultivated with success in the open, it grows vigorously, and blooms profusely, and the flowers retain their freshness for a considerable period. H. paniculata grandiflora, which was introduced from Japan in the second half of the last century, is also largely grown in pots for indoor decoration, and is very effective in the conservatory. Being quite hardy, it can be successfully grown out of doors, and is extremely effective during its season of flowering.

HANDY GARDENING DICTIONARY.—W. C. R., Cheltenham: The handiest book of its kind we know is the "Encyclopædia of Gardening," and it gives all the information you require. It is 3s. 10d., post free, from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

THINNING PEACHES.—C. E. D., Matlock: The final thinning must not take place until the fruits have stoned, because some are sure to fall during this trying period. After stoning the fruits begin to swell fast, and as soon as the swelling commences reduce the crop so as to leave one fruit to each square foot of trellis covered by the tree. If there were signs of unduly strong growth last season then a slightly heavier crop may be allowed.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

C. H. D., Torrington.—Pittosporum crassifolium.

B. T., Lancaster.—1, Forsythia suspensa; 2, Iris stylosa.

F. R. T., Abingdon.—1, Galax aphylla; 2, Calceolaria Burbidgei; 3, Leschenaultia biloba major.

E. B., Grantham.—1, Azara microphylla; 2, Cotoneaster horizontalis; 3, Berberis stenophylla.

S. J. S., Everton.—1, Selaginella Emileana; 2, Nertera depressa; 3, Pteris longifolia; 4, Acacia Riceana.

P. S., Bideford. — 1, Odontoglossum Adrianæ; 2, O. crispum, a poor, starry form; 3, Ada aurantiaca; 4, Dendrobium Parishi.

C. W. L., Swindon.—1, Primula floribunda; 2, Begonia megastigma; 3, Sparmannia africana; 4, Semele androgyna; 5, Mertensia sibirica.

GARDENING ENGAGEMENT.

Mr. Basil Bolton, who during the past six years has been engaged in the public gardens in Bermondsey, and formerly at Oxford Botanic Gardens, has been appointed head gardener to the Borough of Bermondsey Council. There were upwards of 200 applicants.

The Most Valuable Remedy ever discovered.

NOTES OF THE WEEK.

A Late Spring.

However pleasant it may be to pass at the earliest possible moment from the cold and dull weather characteristic of the season of winter, and to watch the bursting flower buds, and the development of the tender green leaves under the stimulative influence of sunlight and a genial southerly breeze, there should be no impatience if the change is delayed to a period later than usual. A great aid to the restraint of impatience when wintry weather passes beyond the boundary of the season to which it belongs, is a remembrance of the fact that a late spring has its advantages. We have had a striking proof of this within the past few weeks, and in connection therewith we need only point out that if this year the spring had been what is commonly known as early, such severe weather as was experienced on April 24 and 25 would have had a disastrous effect on tender vegetation, and more or less completely ruined the crop of hardy fruits. Under existing conditions much damage was done in many districts, and in orchards and gardens where the plum trees were in bloom the crops will at the best be very light. In some instances the currants and gooseberries also suffered so materially that the crop of these fruits cannot be otherwise than decidedly light. Had the trees been fully in bloom as they usually are on the dates of the heavy snowstorm, the plum crop would undoubtedly have been completely ruined, or so greatly reduced as to be hardly worth considering in an estimate of the fruit supply. Owing to the lateness of vegetation consequent on the low temperature that had prevailed until a much later period than usual, the plum trees were not, except in a comparatively few instances, so fully in bloom that all the flowers had expanded. Consequently large numbers of flowers on trees that were hard hit by the frost have attained development since, and as the conditions have been favourable thereto they present a promising appearance. The flowers of trees that were not in bloom have in like manner had the benefit of more favourable climatic conditions, and give promise of setting freely. Whether there will be a realisation of this promise depends upon the weather experienced during the next two weeks, but we suggest that anticipations with regard to the final result be imbued with a spirit of hopefulness. What has been said with regard to plums applies in some degree to pears also. These latter were not quite so far advanced as the plums when the wintry weather was experienced a fortnight ago, and they have produced a wealth of blossom that would appear to justify anticipations of a good yield of fruit. In any estimate, however, of the pear crop that we may base upon the great display of flowers that now so greatly enhances the attractions of the garden and orchard, we must not lose sight of the fact that the reproductive organs of the pear are especially susceptible to injury from cold weather. They would appear to suffer more from this cause before the flowers are fully expanded than do those of other fruits, and as so well known to the experienced fruit grower, they quickly succumb to the effect of a sharp frost or a low temperature continuing for any period. Cherries were at about the same stage as the pears, and, except in some specially warm districts, were not sufficiently advanced to have had any material damage done them. Apples, which form so great and important a part of the hardy fruit crop, are for the present quite safe, for snugly ensconced in the protective coverings which the buds provide, the reproductive organs were unaffected by the wintry conditions, and there is full justification for the hope that they will attain their full development, and perform their allotted functions under genial weather conditions, and be followed in due season by a liberal harvest of fruit; but with these, as with the other fruits, much depends upon the weather that will be experienced during the period of flowering. The value of protective materials judiciously applied has been brought into strong relief this spring, for in some cases that have come under our notice wall trees with a covering of tiffany or a double thickness of old fish netting wholly escaped injury, while others not far distant that were unprotected, have had their crops very considerably reduced. There is nothing new in this, nor is it by any means the first instance that we have brought under the notice of our readers of crops having been saved by a very simple means of protection. One of the most noteworthy examples was that which came under our notice a few years since in the gardens of Syon House. In these gardens a considerable area devoted to bush fruits is enclosed with wire netting of small mesh for the protection of the fruit from birds, and contiguous thereto there was a large breadth of bushes wholly unprotected. The season was much the same as the one through which we are now passing, and a very severe frost was experienced after the currants, gooseberries, and raspberries had made considerable progress. The result of the frost was that the crops outside the wire enclosure were practically destroyed, while those within passed through the ordeal without injury from the frost. Protective measures involve the expenditure of both money and labour, but having regard to the uncertainty of our climate they give an ample return.

Mr. S. T. Wright.—When, in 1885, Mr. S. T. Wright became head gardener to C. Lee Campbell, Esq., at Glewston Court, Ross, he took that step which was necessary to bring him eventually into the very prominent horticultural position he at present holds as superintendent of the Royal Horticultural Society's Gardens. Always showing a keen interest in fruit culture, and in entomology, Mr. Wright had splendid training in such famous gardens as those of Snelston Hall, Woodseat, and Alton Towers, and when he went to take charge at Glewston his opportunity came. Not only had he the gardens to manage, but also some of the finest fruit plantations ever laid down. Cultural ability he already had, and this was made very evident in the course of his ten years' stay at Glewston, because during that period he won about seven hundred prizes, chiefly with apples, pears, and grapes. But Mr. Wright developed business ability also, and based it on the principles of honest, straightforward dealing. At the conclusion of ten years' work he had the splendid record that no single customer among those who purchased the Glewston fruit had ever made a complaint. The skill and business capacity evinced at Glewston Court were prime factors in securing for Mr. S. T. Wright the position of garden superintendent to the Royal Horticultural Society in 1896, in succession to Mr. A. F. Barron. His genial disposition has made for him a host of friends, and though it cannot be an easy matter for him to find every exhibitor at the R.H.S. meetings the position and amount of space wished for, Mr. Wright manages to keep everyone in good humour. So highly are his efforts in this direction appreciated, that a couple of years ago the exhibitors at the Temple Show presented him with a very handsome testimonial. For many years Mr. Wright was a regular contributor to our pages, and he ever advocated the extension of hardy fruit culture on rational lines. He is a prize-essayist of the R.H.S. on the subject of "Commercial Aspects of Hardy Fruit Culture," and this essay won for him a silver medal from the late Dr. Hogg. Mr. Wright is also an author, and his "Fruit Culture for Amateurs" has done much to increase and improve fruit culture in small gardens. It is a great pleasure to us to pay this brief tribute to Mr. Wright's skill and amiability, and we feel quite sure that many thousands of our readers will appreciate the portrait we now present, for his name is now as a household word among horticulturists of every class.

Noteworthy Bristol Gardens.—In accordance with previous announcements we shall in our issues of May 16 and 23 describe and illustrate several of the more noteworthy gardens in and around the city of Bristol, which has long been famous as a great centre of horticultural activity. The gardens of which illustrated descriptions will be given, include Ashton Court, Barrow Court, Cote House, Down House, Downside, Elmfield, Old Sneyd Park, and The Priory.

At the British Association's meeting to be held at Dublin on September 2 to 8, the presidential address will be delivered by Mr. Francis Darwin, F.R.S., on the evening of the opening day. The presidents of the several sections in which our readers will be most interested are: Botany, Dr. F. F. Blackman, F.R.S.; Agriculture, Sir Horace Plunkett, K.C.V.O., F.R.S.; Geography, Major E. H. Hills, R.E.; and Geology, Professor J. Joly, F.R.S. Arrangements will be made for excursions during the week of the meeting to the Shannon Lakes, Powerscourt Waterfall, Boyne Valley, The Dargle, Glendalough, and the Devil's Glen in Co. Wicklow.

American Gooseberry Mildew.—In the course of the proceedings at the annual meeting of the Herefordshire Association of Fruit Growers and Horticulturists Mr. J. Ridley, the president, referred to the presence last year of the American gooseberry mildew in several gooseberry plantations in the county. He said that in his opinion the disease should not have been allowed to enter the plantations, for the Board of Agriculture might have prevented it doing so had they taken the necessary steps. It was well known that this mildew had become established in Ireland four years ago, and he had entered into a long correspondence with the Board with a view to induce them to take action in preventing the importation of bushes into England. He was told in reply to his letters that the Board had no power to act, but he pointed out that if they had not the power they should have taken the steps necessary to obtain it. The American gooseberry mildew was a very serious disease, and what, he felt, should have been done was to keep it in the quarters where it existed, and try some remedy likely to prove effective. Repressive measures had been adopted, and since the Evesham growers had interviewed the Board the diseased bushes were allowed to stand provided they were well pruned and thoroughly sprayed in the spring or early in the summer. In Mr. Riley's opinion compensation for bushes that are destroyed should be paid by the State.

Phenological Observations for 1907.—To a recent meeting of the Royal Meteorological Society Mr. E. Mawley, V.M.H., presented his report on the phenological observations for 1907. According to the report wild plants came into blossom behind their usual dates throughout the whole of the flowering season. Such early immigrants as the swallow, cuckoo, and nightingale were also behind their average dates in reaching these islands. The only deficient farm crop, taking the country as a whole, was that of potatoes, most of the other crops being much over average. On the other hand, the yield of apples and pears, and particularly that of the former, was below average. There was also a deficient crop of strawberries, whereas plums, raspberries, currants, and gooseberries were over average.

"**Public Gardens and Their Construction**" is the title of a lecture to be delivered by Mr. Thomas Winter, superintendent of the Marylebone Public Gardens, at a meeting of the London Branch of the British Gardeners' Association to be held at Carr's Restaurant, Strand, W.C., at eight p.m. on Thursday, May 14.

Primrose Phœnix Daffodil.—This beautiful new double daffodil is a fine flower in size, substance, and colour. The shade of colour is deep primrose-yellow, the form is that of a glorified gardenia, and the blooms are three and a-half inches across. This new variety has received an Award of Merit from the Royal Horticultural Society, and a First-Class Certificate from the Midland Daffodil Society, and the happy possessor of the stock is Mr. John Walker, of Thame, Oxon.

The National Tulip Society holds its fifteenth southern exhibition at the Royal Horticultural Hall, Vincent Square, on Tuesday, May 26; at least that is the intimation we have received in the form of a schedule of the proposed show, but as Tuesday, May 26, is the first day of the Temple Show we are wondering whether a mistake has been made. One thing seems quite certain, i.e., that if the Tulip Show is at Vincent Square on May 26, the tulip fanciers will have the hall and the flowers to themselves, as the horticultural public will be at the Temple Gardens.

Flower Shows at the Franco-British Exhibition.—The first of the flower shows that have a place in the programme of the Franco-British exhibition will be held on the 19th and 20th inst. There are twenty-one classes in the schedule, and of these the first four are for decorated dinner tables of a size suitable for twelve persons. In two classes any flowers, with the exception of orchids, may be used, and in the others orchids only are admissible. There are two classes for three vases of miscellaneous flowers arranged for the drawing-room, and one for three vases of orchids. There is also a class for bouquets, and one for twelve vases of sweet peas, but in the latter the prizes are inadequate for that number of vases so early in the year. The remaining classes are for collections of plants of various descriptions.

The Finest Herbarium in the World.—We understand that the trustees of the Shaw estate have commenced a scheme that is to cost half a million dollars. It includes the construction of seven new buildings on the Missouri Botanical Garden property, and the establishment of the finest herbarium in the world. Much good work has been done at the Missouri Botanic Gardens, and the new scheme, when completed, will tend to enhance the reputation and usefulness of the establishment.

A Beautiful Acacia is A. cultriformis, and this particularly fine species is splendidly grown by Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted, who has sent us a few long, graceful growths smothered the whole length with pleasing yellow blossoms. Mr. Gentle grows this very fine specimen at Little Gaddesden in the conservatory, where, year by year, it is a beautiful sight each springtime. A. cultriformis was introduced from New South Wales in 18[illegible] but it is a species that, despite its great beauty and usefulness, is not very widely grown.

Helping the Chicago Market Growers.—Mr. J. J. Davis, the assistant State entomologist of Illinois, is to devote several months to the investigation of the insect pests that attack field and greenhouse crops in the Chicago district. Any grower who is troubled with insect pests has only to notify his trouble to the entomologist, and every effort will be made to help him.

Scab on Potatoes.—During the past two years experiments have been conducted by the Agricultural Department of the University of Leeds with a view to determine whether there is any connection between the development of the disease known as potato scab and the moisture holding capacity of the soil. For the purpose of the first experiment a field on a farm where potatoes are especially liable to attack was selected. To increase the moisture-holding capacities of the soil, the different plots were dressed with peat moss, rape meal, sawdust, and shoddy, and one plot received a dressing of salt and sawdust. The peat moss and sawdust were steeped in water and distributed along the rows, after the tubers had been planted, but the rape meal and shoddy were applied in a similar manner but in a dry state.

Sawdust appears to have been the only material that had any effect in checking the disease, and it was most effective when applied in conjunction with salt. Last year the experiments were conducted on the Gosforth experimental farm, where potatoes are usually much injured by scab. Here sawdust and peat moss, with and without an addition of salt, were used as applications to the soil. The sets for one plot were immersed for two hours in a solution of formalin formed by the addition of eight fluid ounces of commercial formalin to fifteen gallons of water. The potatoes lifted from the untreated plots were considerably affected by scab, and those from the plots dressed with peat moss were but little better. The crop from the plot planted with sets treated with formalin and also from those to which sawdust was applied were but slightly affected by the disease. It was found that while salt was useful in checking scab, it also had the effect of diminishing the yield. From the experiments conducted during the two years it is considered that the application of sawdust with or without salt checks the disease, and it is stated that no evidence has been obtained from the experiments in support of the theory that the result has been obtained by increasing the moisture in the soil.

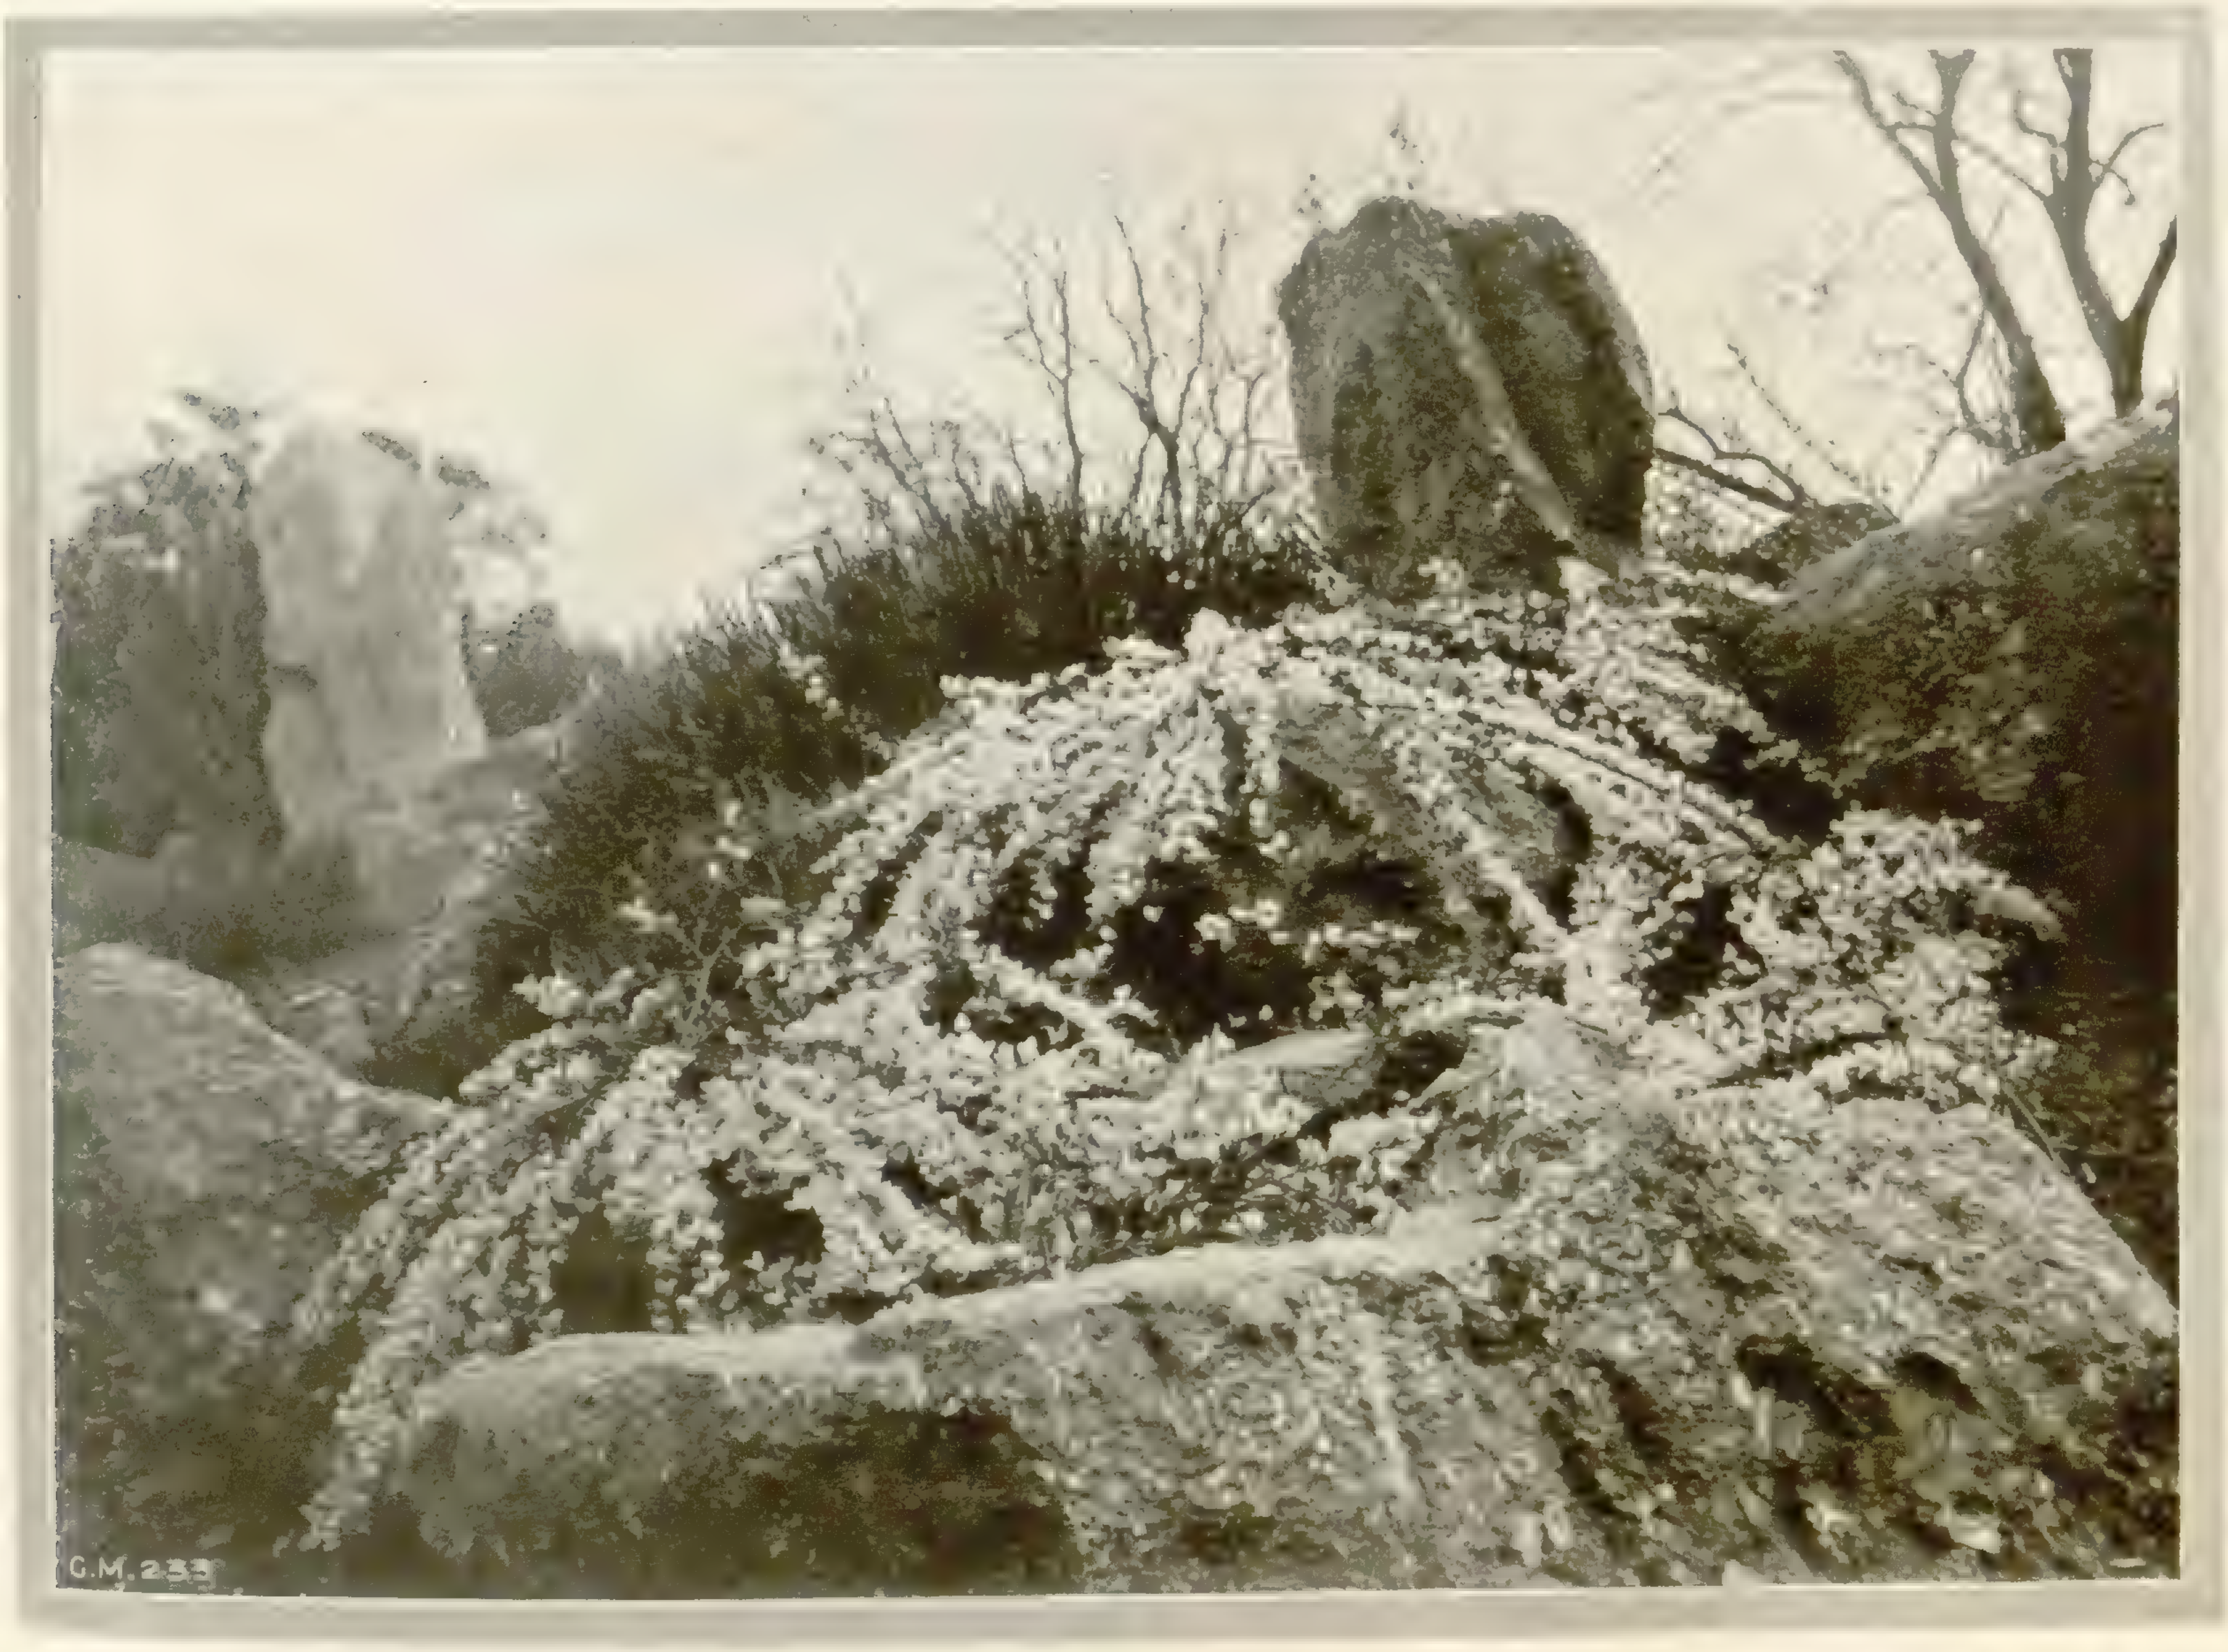
Tomato Culture at the Cape.—For some time past the possibilities of engaging in the cultivation of tomatoes on a large scale for commercial purposes has been much discussed at the Cape. The climate of South Africa is so well suited to their growth that it has been felt by those interested in the profitable utilisation of the land, that good returns would be obtained from their culture, provided a market could be opened up for the sale of the fruit. Owing to the home consumption being wholly inadequate, and most other countries either producing supplies equal to their requirements, or, having high tariffs, attention was directed to England as a possible outlet. Before materially extending the growth of tomatoes at the Cape, investigations were made as to the possibilities of the exportation of the produce to this country at a remunerative rate, and from the result of these it does not appear likely that Cape tomatoes will make their appearance in British markets. The Trades Commissioner, who has had the matter in hand, reports that in his opinion there is no prospect of a profitable trade in tomatoes with this country being developed. He points out that at the present time the markets of the United Kingdom are already fully supplied with tomatoes throughout the year, abundant supplies being sent from the Canary Islands and other countries.

THE KEW BROOM.

(Cytisus kewensis.)

Everyone admires the brooms in their varied forms, and there are few indeed of these charming shrubs which can well be rejected as unworthy of the garden. Even some of the forms of the common broom, Cytisus scoparius, are among the finest ornaments of our gardens in their season. This remark is not to be considered as in any way derogatory of the common broom itself, than which no other native plant is more delightful, but where it is plentiful in a wild state there is no need to introduce the typical form into our gardens.

There are many lovely brooms not well known to the majority of garden lovers, and among these one of the newest deserves still greater prominence given to its merits, although from time to time its beauties have already been spoken of in these columns. This is Cytisus kewensis, which originated in our great national collection in the Royal Gardens of Kew, and is in every way worthy of that great establishment and of the name it bears. It is a delightful plant, with prostrate habit and long branches of graceful growth, and bearing in early summer quite a multitude of its pale, cream-coloured flowers—a term of description which fails to give an indication of the exquisite beauty of the plant when in full bloom, trailing over a stone or bank, and giving one of the most delightful pictures of floral beauty one can conceive. It is said to be a hybrid between C. Ardoini and C. albus, and in its habit it possesses the style of the former, while in its colouring it comes midway between its parents. It is only within the last year or two that its price has been low enough to bring it within the



[Photo: D. S. Fish.

CYTISUS KEWENSIS.
A beautiful trailing broom, with large rich yellow flowers.

reach of the average amateur; although it is understood to have originated about twelve years ago. When better known it is certain to command a popularity few of the dwarfer cytisuses of hardy nature have achieved. Its newer companion, C. Beani, which has yellow flowers, is not likely to be in such favour as C. kewensis.

S. Arnott.

WINTER-FLOWERING STOVE PLANTS.

Though stove plants have, as a rule, gone out of favour, there are still some of them amongst the winter-flowering kinds that are grown on account of their bright coloured flowers, which are produced in great profusion through the dull months. Those enumerated below will be found some of the most serviceable whether for cutting or decorative purposes.

Roellia macrantha.

This produces very showy flowers up the shoots made during the preceding year, therefore, to have them of the best type cuttings should in spring be inserted in a light sandy soil and placed in a propagating case, where they will soon take root. When rooted they should be put singly in 4in. pots and returned to a slight hotbed until established, and when the pots are filled with roots they should be transferred into those of 6in. or 7in. in diameter. Early in June the plants will be established in these pots, when they may be transferred to cold pits or frames for the summer months. The plants should be grown in the full sunlight that the young growth may be ripened before autumn sets in.

Euphorbia jaquiniæflora.

The genus Euphorbia embraces a great number of species, but, with the exception of the above-named, and the old species having long spines known by the name of E. splendens, none of them are worth cultivation in our stoves. Euphorbia jaquiniæflora needs special treatment to grow it well. Like most other plants that are grown specially for the production of cut flowers, young plants give the greatest satisfaction. For this reason, those who are desirous of growing them well must make preparations beforehand. Unlike the poinsettia, to which it is closely allied, it needs a stove temperature through the summer, whereas the other may be grown in a cold frame until September, before it needs a heated structure. To work up a good stock of this, it would be well to procure some old plants early in spring, and if such have not already been cut back, their shoots should be shortened somewhat to induce them to make young growths. If these are placed in a brisk temperature, such as a melon house or pine stove, the buds up the old shoots will soon begin to push, and when they have made growths about an inch and a-half in length, these should be taken off with a heel attached and dipped at once into dry sand or powdered charcoal to prevent them bleeding. Having prepared the requisite number of small pots by filling them with a light compost consisting of about equal parts peat, loam, and sand, passed through a fine sieve, insert three cuttings round each pot, then plunge the pots in a close propagating case where there is a brisk bottom heat. In such a place the cuttings will not be long in making roots, and when they are well established they should be taken out of the case and accustomed to the temperature of the house. As other batches of cuttings become large enough, these should be taken off, and, after inserting them in small pots may be put in the propagating case as the others are removed. If this process is repeated a sufficient quantity will be rooted by the end of May. When the pots are filled with roots give the plants a shift into those of larger size, then stand them on a shelf near the glass in a melon house or pine stove where they can be trained up close to the roof. Here they should receive all the sunlight possible that the wood may be matured before the cold weather sets in. If they receive due attention in the way of watering, syringing, etc., during hot weather, by the autumn they should have made growths from two to three feet in length, which will bloom most profusely through the dull winter months, at which season their bright orange-scarlet flowers are most attractive.

This euphorbia will require a high temperature during the growing season, therefore those who do not possess a suitable structure would do well not to attempt its cultivation, for it being better to leave such plants alone than produce the miserable little unhealthy objects one sometimes sees where proper accommodation cannot be provided for them.

Poinsettias.

The large bright-coloured bracts of these are always attractive during the dull winter months, and as those plants carrying one head are the most useful for decorative purposes, it is such that should be grown. The old stools should be started into growth early in April, and as the shoots become large enough, they should be taken off with a heel and dipped in sand as recommended for the euphorbia cuttings. The cuttings should be inserted singly in small pots and placed in a close case until rooted, when they may be gradually hardened off to fit them for the temperature of the house or pit. When the pots are filled with roots they should be shifted into those of about 6in. in diameter, commonly known as 32's. After potting they can be stood on a slight hotbed for a few days until new roots are formed, they will grow away more rapidly. When established they may be stood in a cold pit or frame where they can have all the sunlight possible. Here close to the glass they will make sturdy short-jointed growth with large thick foliage. By September, when the nights are becoming cold, they should be taken to a warmer structure where fire-heat can be afforded them. Here a portion of them will soon commence to develop their bracts. There are several varieties of P. pulcherrima. One that flowers early has more purple in the bracts than the late form, which has longer bracts of a fine scarlet colour, and will remain in perfection until February. There is also the double form known by the name of plenissima, which, though very nice, is not so graceful as the single ones. The variety producing white bracts is of but little use, as there are other plants that give us white flowers that are far preferable. It may not be generally known that if the stems of these are dipped into hot water as soon as they are taken off they will remain fresh for a much longer period. They ought to always be stood in warm water when placed in vases, and kept away from draughts. If those that have flagged considerably are immersed in hot water for a time they will come round again and look quite fresh. This is one of the brightest and most useful winter-flowering plants we have.

Sericographis Gheisbreghtiana.

This old subject has almost gone out of cultivation, but it is one of those old things that are worthy of a place, for when well grown, like several species of the justicia it is very showy during the dull winter months. Cuttings of the young shoots will root readily enough in the spring, and if these are potted on, and given liberal treatment through the summer, their upright spikes of bright red flowers which are produced on the terminals of the young growths in winter are very attractive.

Coleus thyrsoideus.

The bright blue flowers of this species are produced on long upright spikes, and are of such an intense colour that they invariably attract the notice of all. This is a soft-wooded plant of easy culture, and may be propagated either from seed or by cuttings in spring. A light rich soil and liberal treatment will ensure a wealth of bright blue in the dull dark days of winter.

H. C. Princeps.

LITHOSPERMUM ROSMARINIFOLIUM.

Growers in particularly warm districts are loud in their praises of this lovely Grecian shrub, whose rich blue colouring rivals that of the better-known L. prostratum, but this time in bush form, and there is no stint of flowers on old plants in the early days of spring. One cannot recommend this plant to all who happen to possess a garden, as there is nothing more fatal to garden enthusiasm than to take it for granted a fine specimen in the Isles of Scilly is evidence that the plant is hardy in Britain. This lithospermum will thrive in many sheltered gardens along the South Coast, almost anywhere in the West, and in the few sheltered gardens of Western Scotland where rare plants are tested and grown.

The plant itself is a dwarf bushy rosemarylike shrub, thickly clothed with peculiarly glossy leaves, and the large blue flowers nestling among the polished leaves of frame-grown specimens are a revelation of rare beauty, and one wonders the while what large plants in the South of France, unseared by cold winds, must be like when in full blossom. It does not thrive in small pots, but can be grown into good specimen bushes if liberally treated in a cool house, and planted out under glass in a soil of peat and sharp grit rammed as hard as a roadway, it will make remarkable growth and flower better than it ever does under pot culture. Once established in the open it can be rejuvenated now and again by pegging down several side growths, tongueing and layering these, and allowing all to grow away together. Several fine patches I know in Cornwall are treated in this way with splendid results.

G. B. Mallett

Climbers.—Many plants used as climbers are rapid growers, and as these are now in full growth they will need frequent attention to keep them tied into position and to prevent them from getting into tangled masses, the liberation of which is sure to do much damage to the leaves and tips of the shoots. This especially applies to the myrsiphyllums, ipomaeas, thunbergias, and others which have a great tendency to twine round everything they can reach. For the useful myrsiphyllum there is no better plan than training each strong growth to a length of thin string in an upright direction, as the strings and growths may be cut together and the former then easily drawn out.—F. B. Field.

BORECOLES OR KALES.

During the spring months of the year there is a special value in the kale family, because it yields large supplies when other kinds of greenstuffs are generally scarce. The savoys are over, and the spring cabbages are not ready for cutting until the middle of April or beginning of May. Therefore, the kales should be rather extensively grown, or, at any rate, in sufficient quantity to meet the requirements of the season.

If broccolis prove disappointing because of winter frosts, the kales can be still relied upon to yield their crop in due course. Although they are not generally considered as being in the first rank as regards quality, yet, if properly cooked, they are by no means to be despised, and are worth a place, especially the improved type of Cottagers' or Sprouting kales that have been sent out in recent years.

I have been recommended to grow a variety called Chou de Russie, as it is said to be a first-class kale, being extremely hardy, and the flavour, I am told, is excellent, both as regards the larger leaves and the side shoots from the stems. If the latter are picked similarly to the usual manner of Brussels sprouts, by leaving the centre growth to remain to the last, it will largely prolong and increase the amount of produce from the plants.

Sutton's A1 is perfectly hardy, and very productive, giving quantities of side shoots from Christmas onwards; its flavour, too, is everything that could be desired. The Drumhead kale, although quite different in its character of growth, is invaluable, as it yields large quantities of most useful produce, which has a flavour quite its own. For the latest cutting the Hearting or Cabbaging variety is good, and a profitable crop. The Asparagus kale, too, has long been known, and grown as a prolific and useful vegetable for late spring cutting. When cooked the sprouts have a decided flavour of asparagus, which makes them favourites with many.

Seeds of the kales should be sown during April or early in May in prepared seed beds; only a few days will elapse before the young plants will show themselves above ground, and when large enough, and having formed their rough leaves, they should be pricked out into nursery beds at about six inches apart. With this crop, as with most others, the better the cultivation the better the results, yet it is a fairly accommodating crop, and the plants will stand without harm in the nursery beds for a considerable time. Being quite hardy against frost they go on growing later in the year than other greens, and thus it is not so necessary to make sure of early planting, consequently ground that has carried other crops may be filled up with kale.

Such quarters as have carried a crop of second early potatoes are excellent, and will require very little preparation. The lifting of the tubers will leave the ground in a capital condition for planting. Pea ground, too, is suitable, and only requires to be surface cleaned; it will have been liberally manured for the pea crop, and the firmer the soil the better for the kales, as they will then form solid growth to defend themselves against hard, wintery weather. It is well not to plant too closely together, but allow space for air and light to play round each plant. The stronger-growing varieties will require two feet six inches from row to row, and two feet from plant to plant in the row, the smaller growing and dwarf kinds need correspondingly less room, but all will require not less than two feet space from row to row.

Before the plants are removed from the nursery beds give them a thorough soaking with water to moisten all their roots, and then cut them out with balls of earth, carefully, so as to remove them to their permanent quarters without giving them a check. This attention is amply repaid by their starting straight away into growth, and thus saving time, whereas the checked plant will require a fortnight to recover, and possibly then will grow considerably less vigorously.

After planting, especially if the weather is dry, give the plants another soaking, with further attention for a few weeks should they require it, till thoroughly established, they will then take care of themselves. Should they through any cause not grow satisfactorily, give them a dressing of some quick-acting manure when the weather is damp. But for the whole of the Brassica family there is no better stimulant to growth than frequently stirring the surface of the soil, more especially during dry weather. When the plants have advanced in size, and on the approach of winter, it is of advantage to mould up their stems by forking the soil up to them each way between the rows; this acts as a protection against sharp frosts, as well as a steadying effect against wind.

AN EXAMPLE OF SCENIC ART AT THE GHENT CENTENARY FLOWER SHOW.

This beautiful scene filled one end of the new exhibition house at the Ghent Centenary Exhibition. It was on canvas, and Mr. Burvenich had so arranged the groups of rhododendrons and hydrangeas, and the paths, that it was difficult to determine where the real plants and walks left off and the artist's work began. This was one of the great features of the exhibition, and fully merited the praise so liberally accorded it by the many horticulturists present.

Everyone interested in a garden should obtain a copy of the **Alphabet of Gardening**, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s., by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

A TREE.

In the two great branches of the biological tree, into which the potencies of the original life plasm have diverged, viz., the animal and the vegetable, we find in both numerous examples of relatively huge size as compared with their fellows, while in both, at the other end of the scale, we have extreme and microscopic minuteness, combined, nevertheless, with certain faculties common to all, viz., the power of assimilation of nutriment, and that of reproduction. In the animal kingdom in these days we may instance the whale and elephant as the largest forms extant, and in the vegetable the redwood or sequoia of one type, and the banyan of another. Fossil remains, however, demonstrate that there formerly existed gigantic creatures far exceedingly the elephant in size, while the largest whales now existent probably still hold their own as regards dimensions with any predecessor, though man is energetically doing his best to reduce the race both in size and numbers. The largest existing trees, on the other hand, far and away exceed in size any other forms of organised persistent life, and enjoy a longevity to match, since internal evidence afforded by those which have been felled indicates an undoubted existence extending over two or three thousand years.

Given a stable environment, there seems to be no reason why such a tree as the sequoia should perish, since it is built up on principles which give it practically unlimited scope for increased growth, unaccompanied by any weakening factor. If we could dissect such a tree longitudinally from its very base, we should find its trunk to have commenced by a slender tapering stalk, the product of the seed, and over this stalk, year by year, an enveloping sheath of fresh wood was formed on the same tapering lines, but of annually increasing height, lateral buds forming branches as growth proceeded. Obviously such an arrangement implies an annual strengthening to counteract the increasing strain, while the root system below the surface of the ground would be ramifying and increasing also in sympathy. As time went on the primary lateral branches would perish, possibly owing to the shade of adjacent growths, and of those subsequently formed by the tree itself, and a definite trunk becomes visible, within which now is a series of successive woody covers enveloping the original one, and now sheathed in a protective bark. So the tree progresses from year to year, from decade to decade, and eventually from age to age, until it becomes the monarch of the forest, remaining still as hale and hearty as ever. Such longevity, however, can only be attained under particular circumstances. No such mammoth tree could be developed in an exposed windy situation, and its particular habit of growth is immensely in its favour by not involving that spread of long, horizontal lateral branches, such as we see in the oak and other trees, which tend, sooner or later, to damage the tree by their own breakage owing to the ever-increasing leverage they exercise as they grow longer and heavier.

One of the oldest known trees, the banyan, corrects this tendency by sending down aerial roots from its spreading branches, which are subsequently supported by these as by so many columns. We have consequently in such a tree a practically immortal one, though on quite different lines to the sequoia. Such practically permanent vegetative growths we may, in some respects, liken to the animal ones of coral reefs, which are built up by the individual coral organisms, each one of which exists for a comparatively brief period, during which it adds its mite to the general structure. The leaf is really the individual builder in the tree system, it, too, lives a short life, during which it is busy adding its contribution to the general growth.

There is, however, one literally vital difference, the coral builder simply adds, as it were, a local dead brick to the edifice, the leaf contributes, in conjunction with its fellows, a quota of building material to the general structure, so that it is conceivable that a contribution from the topmost spray of the sequoia may swell the lowermost ring of wood at its very base, since every atom of this is built up by the leafage far away up in the air above. The coral builder is an individualist, he builds himself a house which, so far as he is concerned, is an accidental addition to the general fabric; the leaf is a beneficent, unselfish altruist, practically giving its life blood for the benefit of the community, present and future.

Chas. T. Druery, V.M.H., F.L.S.

AN APRIL WINTER.

"The first it sall be wind and weet,
The next it sall be snaw and sleet,
The third it sall be sic a freeze
Sall gar the birds stick to the trees."

Could not those old lines about the Borrowing Days of March be more truly applied to our recent spell of wintry weather? During the week ending April 25 we have had, in some districts, 24 degress of frost registered, the lowest reading we have had since the winter of 1906-1907. Snow in some places in the South of Scotland fell for twelve hours continuously, and lay in town and country to a depth of from six to twelve inches. Fortunately, in the far North of Scotland few of the trees have put forth their buds, but the flowers of the ribes have been nipped, and garden lovers look anxiously for other signs of damage wrought by this late return of winter. Rhubarb, monkshood, and other rapid-growing plants, which had reached a height of from twelve to eighteen inches, have been frosted down to the surface, and the growths now lie limp. Plants recently put into the ground have been completely ruined. The writer paid a visit the other day to Higher Deeside (Aberdeenshire), and there found in the glens and among the hills winter and spring fighting, as it were, for mastery. Victory, of course, will be with the last, but winter still has its grip fast upon the higher hills, and on the days of our visit it raged with a violence one could only expect in the month of December.

Lochnagar and Ben-a-Buird and Ben Avan, Cairntoul and Braeriach and Ben Muichdhui are as white as we write as they were in mid-winter. The river Dee beneath the Devil's Point is still buried in snow. The higher slopes have all been iced, and are now so hard and glazed that one needs an ice-axe to make a footing on them. Such aid is doubly necessary when the wind is raging, as it did on our visit, driving the snow showers before it and roaring like some fiend incarnate through the Larig Ghru, and past the shoulders of Cairntoul, so that the climber was fain at times to throw himself upon the snow and cling to the very body of the hill for safety. To pass from this tornado of the elements high on the hills down into the valley of the Quoich or the Lui was to pass into a haven of peace. Winter still rules on the hills, but in the glens his hold is going—fancy having to chronicle such a statement in the last week of April!—and everywhere in the low ground there are signs of spring. The mountain burns are full, and everywhere water pours from the slopes, flooding the paths and gurgling in every little hollow from the hills.

The heather is still brown and withered, but in some of the tips one can see the faintest flush of growth. There are birds, too, calling about the water's edge, which were not there a month ago. And most distinctive note of all is the wonderful misty purple of the birches. Every twig is touched with this purple or plum-like tint, and the effect of the masses of this upon the hillside is exceedingly beautiful. Everywhere there is the sense of awakening, but as we write it is hard to believe that the miracle of spring is being wrought again for us as the snow showers and the strong wind, with its bitter "stang," sweep down upon us, and the hills are blotted from our eyes by the whirling winter's curtain.

Aberdeen. W. Kelly.

THE GREAT GOLDEN KNAPWEED.

Although in some respects a somewhat coarse-growing plant, Centaurea macrocephala, the great golden knapweed, deserves a little more consideration than it has received for some years, as it is by far the most imposing and effective of the yellow knapweeds, and, when planted aright, will serve an excellent purpose in the majority of gardens. It has been, however, somewhat neglected, and in unsuitable conditions its boldness and vigour have not been fully displayed, so that its true worth has not had full scope for recognition.

To do the great golden knapweed full justice it ought to have a good and rich soil, in which it can develop its full stature of four or five feet, its massive leaves, and its great heads of golden-yellow, which, to the unobservant, remind it of some noble yellow thistle. The writer once sent a plant for exhibition to a small local show, and many admired this "yellow thistle," as they called it, as it stood at its full height in the hall.

In the garden its true position is in front of some dark shrubs, or far back in the border, but never crowded up, so that it may stand out in "splendid isolation" from other things, and have sufficient room to exhibit its characteristic features. It must also have good soil, and occasional waterings with weak manure water in dry seasons will improve its effect in every way. It can also be employed as a cut flower where bold blooms are required for large vases or other methods of hall decoration.

Centaurea macrocephala can either be increased by division or raised from seeds. The latter afford a simple means of securing a good group in the course of a year or so, and they may either be sown under glass in early spring or in the open in May. With the ordinary treatment of seedlings of hardy perennials young plants will flower the following year.

S. A.

Primroses and Polyanthuses.—Where seedlings of these are flowering for the first time make note of the best types or forms of them. As they pass out of bloom, or soon after, they should, if the ground is required for summer bedding, be lifted. Carefully divide them into single crowns, and replant in the reserve garden or border, where they will complete their growth. Moderately heavy soil suits them best if enriched with a dressing of well-decayed manure. An open position is not necessary; plant about nine inches apart each way and good vigorous growth will ensue. Any surplus crowns or clumps may be planted out in the wild garden or woodland.—E. F. Hazelton.

NEW PLANTS, ETC.

ODONTOGLOSSUM CRISPUM QUEEN OF THE EARTH.

A very handsome and beautiful variety, and one that is alike remarkable for its fine form and brilliant colouring. The margins show a little fringing; the ground colour is deep rosy blush, and on this are numerous heavy blotches of intense and vivid wine-red colouring. The plant exhibited carried a fine spike of flowers. F.C.C., R.H.S., April 28. De Barri Crawshay, Esq., Rosefield, Sevenoaks.

ODONTOGLOSSUM NÆVIUM.

An old species, but one not often seen nowadays. It is somewhat like a small edition of O. cirrhosum. Found in 1842 by M. Linden, it was introduced to cultivation by M. Funck, and sent out from M. Linden's establishment at Brussels, but it has always remained rather a rare plant. The sepals and petals are narrow and wavy, white, freely spotted with dark-red. Lip elongated, white, spotted crimson, and with a yellow disk. A.M., R.H.S., Messrs. Armstrong and Brown, Tunbridge Wells.

ODONTOGLOSSUM PLATYCHEILUM SUPERBUM.

An interesting and rare Guatemalan species, with rather small flowers in which the broad lip is the most conspicuous portion. In the type the lip is white with rose spots, but in the variety superbum the colour is soft pink with deep rose spottings. A.M., R.H.S., April 28. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

CIRRHOPETALUM WENDLANDIANUM.

A pretty and interesting species, reminding one of C. picturatum. The flowers are about five inches long, produced in umbellate fashion from the apex of a slender spike; the colour is tawny yellow, heavily streaked and shaded with red. A.M., R.H.S., April 28. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

ÆRIDE VANDARUM KIRKE'S VARIETY.

A blush-tinted variety of the old, pure white, terete-leaved ærides. The flowers are very pretty, and a couple of inches across. A.M., R.H.S., April 28. Mr. Huxley, gardener to Mrs. Bevington, Murle Wood, Sevenoaks.

HIPPEASTRUM PURITY.

With the exception of a little green in the throat, this variety is pure white, and it has remained pure during the past three years, whereas Snowdon, another beautiful white seedling, has developed some colour since it was first shown. Purity is of good shape and size, and marks a distinct advance in hippeastrums. F.C.C., R.H.S., April 28. Mr. C. R. Fielder, gardener to Mrs. Burns, North Mymms Park, Hatfield.

AURICULA PHYLLIS.

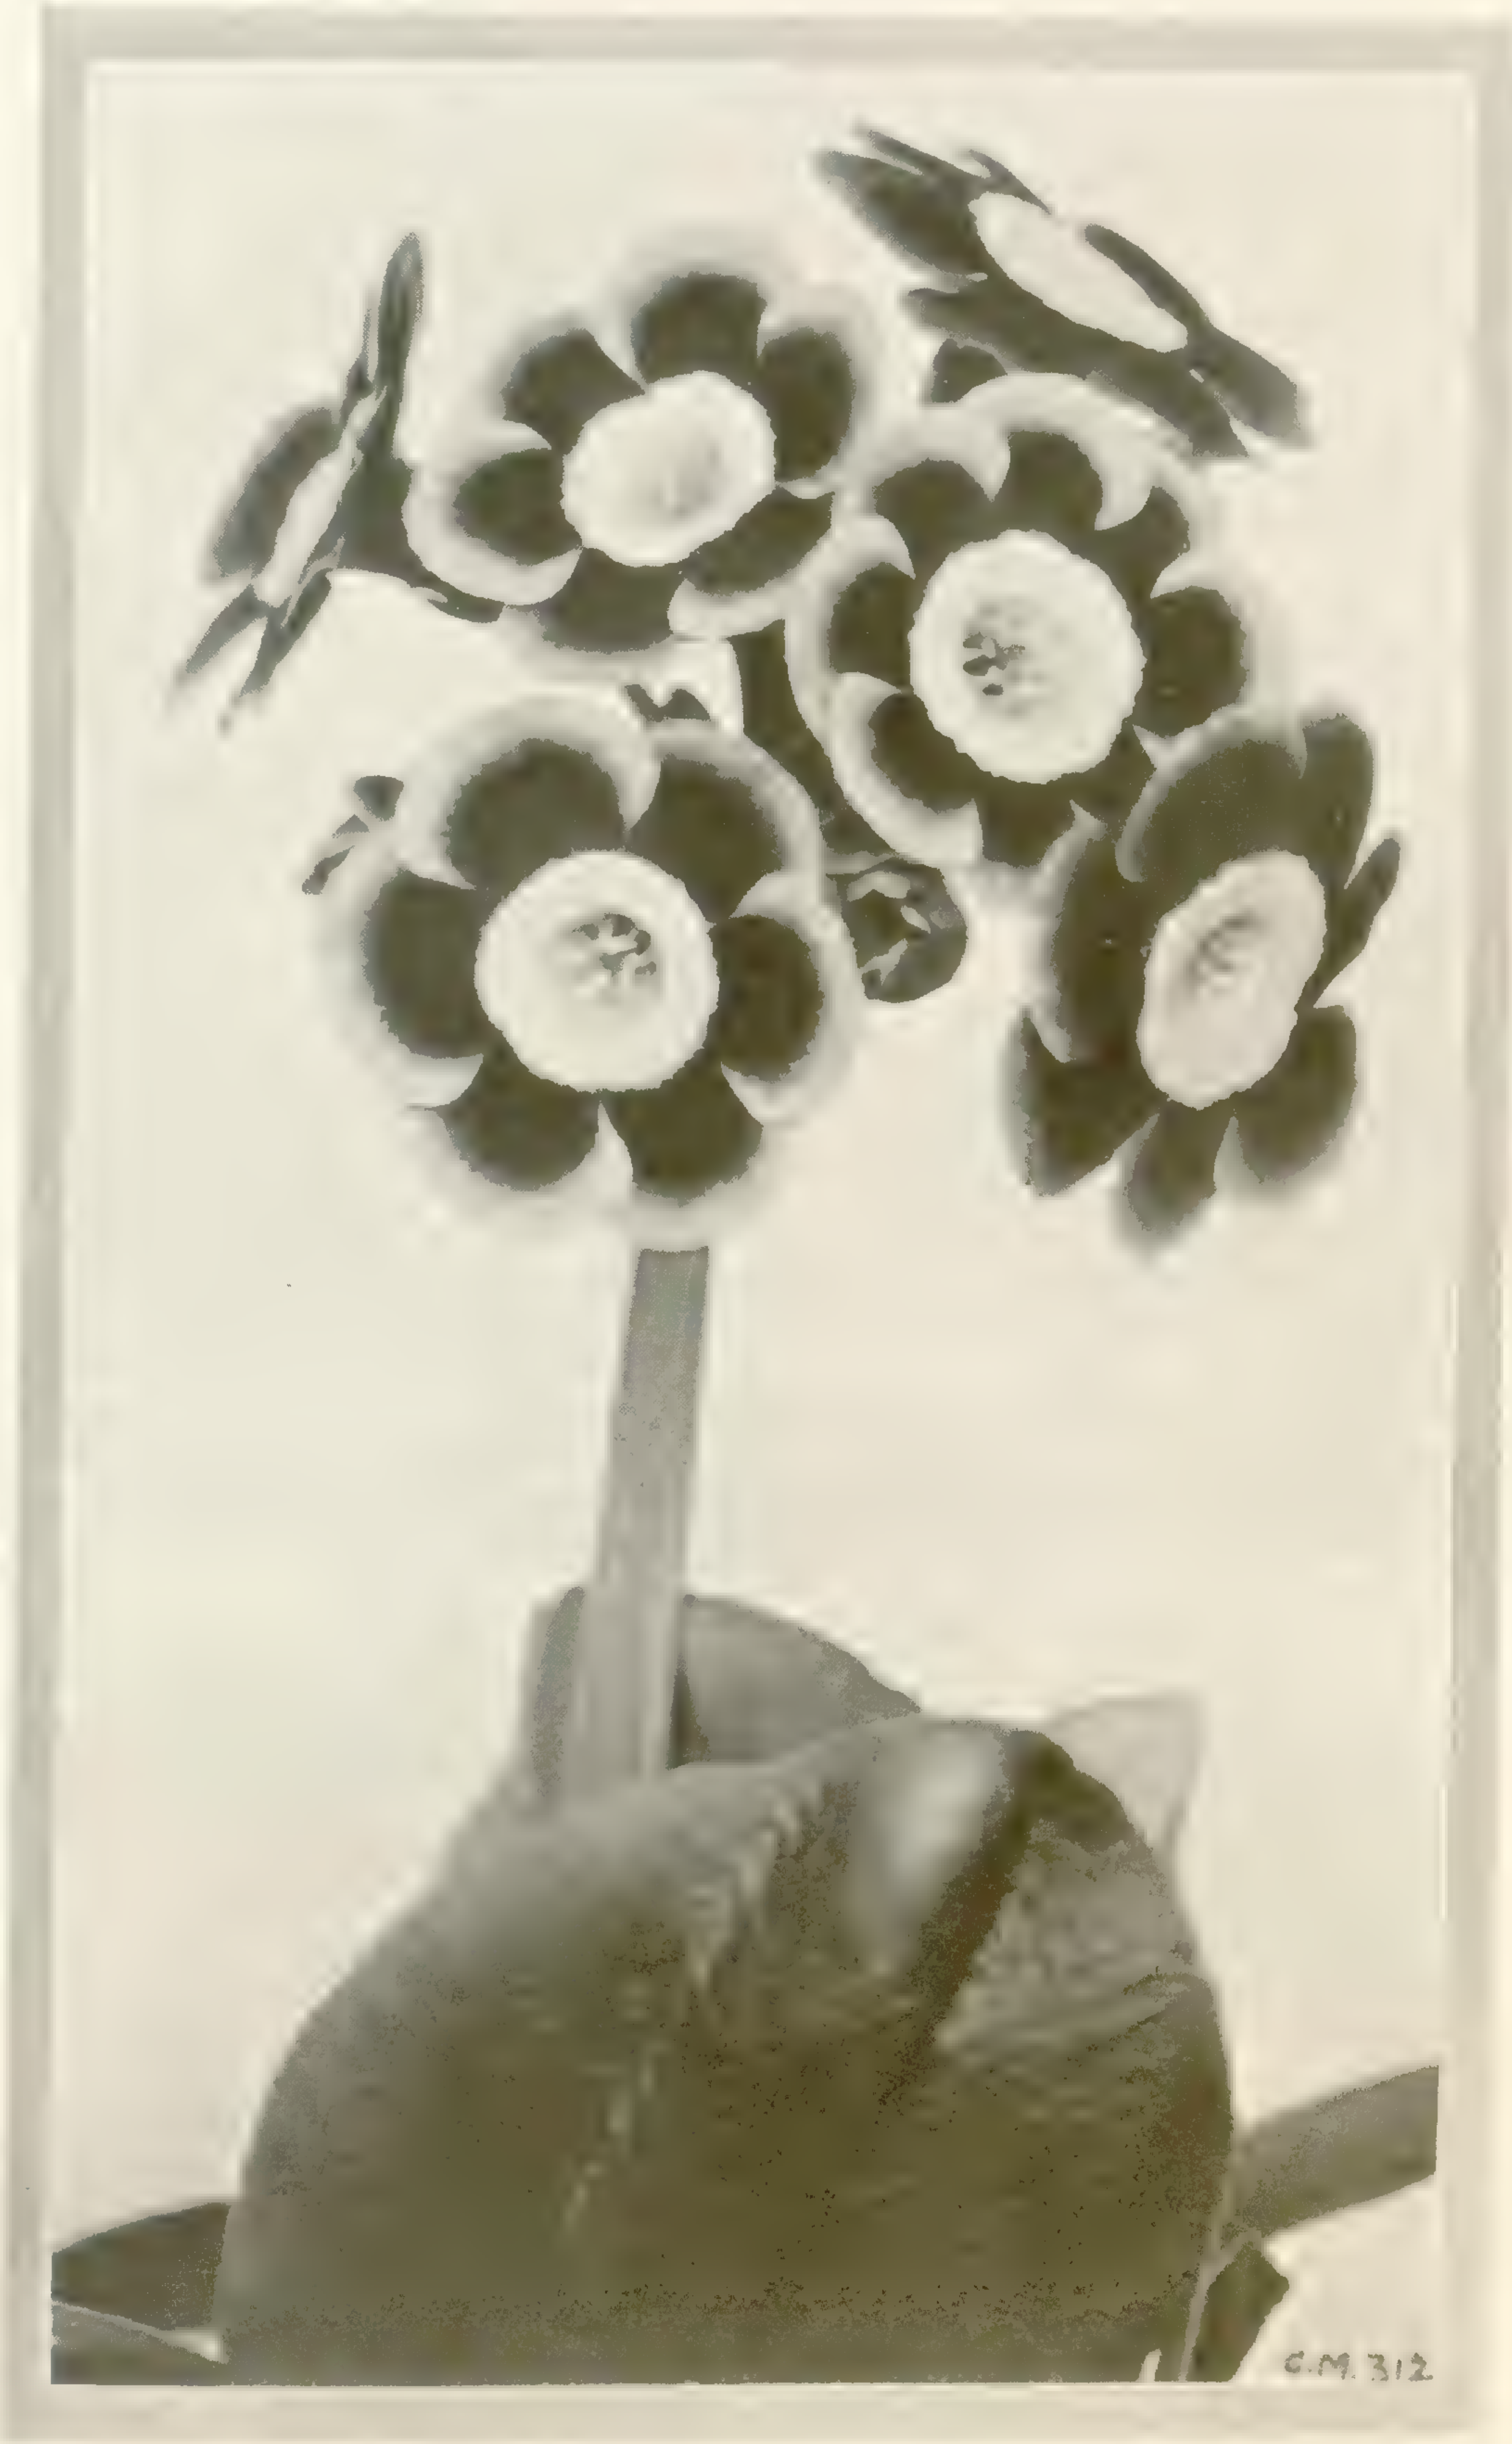
A very bold and beautiful alpine auricula with bright and deep rosy-purple colouring around a well-defined central cream-coloured area. The flowers are large, and the variety is evidently a strong-growing one. A.M., R.H.S., April 28. Mr. Jas. Douglas, V.M.H., Edenside, Great Bookham, Surrey.

AUBRIETIA LAVENDER.

An especially fine and useful variety that has particularly large flowers, borne in the greatest profusion. The colour is soft lavender, hence the name. The variety is also notable for its late flowering; the pans shown had been flowered in a cool house, and were then considerably in advance of their time of flowering out of doors. A.M., R.H.S., April 28. Mr. Maurice Prichard, Christchurch, Hants.

REHMANNIA ANGULATA.

The wonderful popularity of this Chinese greenhouse plant makes us almost forget that it is new. It was found in the provinces of Hupeh and Kweichau by Mr. E. H. Wilson, when collecting for Messrs. Jas. Veitch and Sons. It will grow from 4ft. to 6ft. high, but in pots it seldom exceeds 3ft. The large, campanulate, gloxinia-like flowers, with their bright rosy-pink colouring and yellow, brown-marked throat, are very beautiful. At Kew the seeds are sown in gentle heat in May, and the seedlings are grown in a frame until the following May, when they are planted out in an open, warm border; they grow away freely, and by July are in full bloom, and from four to six feet high. "Bot. Mag.," t. 8,177.



NEW ALPINE AURICULA, PHYLLIS.

Flowers rose purple and cream. A.M., R.H.S., April 28. Mr. J. Douglas, V.M.H., Great Bookham, Surrey.

CODONOPSIS CONVOLVULACEA.

A twining perennial, not quite hardy, bearing blue flowers sparingly. The plant might be designated a climbing campanula. The species comes from Eastern Asia, where it appears to be widely distributed. The flowers are 2½ inches across, bright blue, and with the segments cut down right to the base. As few flowers open at once, the species does not promise to be of much horticultural value. "Bot. Mag.," t. 8,178.

PYRUS TSCHONOSKI.

A rare and beautiful Japanese tree that has proved quite hardy at Kew. It has an erect, open, and rather formal habit, and flowers in spring, producing white, pink-tinted flowers in umbel-like racemes; these are followed by globose greenish-yellow fruits, very harsh and gritty. "Bot. Mag.," t. 8,179.

PYRUS ARIA MAJESTICA.

A very handsome and effective garden variety of the popular White Beam tree, and probably the very finest form of the species. It is perfectly hardy and flowers and fruits regularly, and ought to be extensively cultivated in gardens where there is ample room for its development. The flowers are deep cream-colour, and comparatively small, though freely produced; these are followed by loose, nodding corymbs of brilliant red fruits, each fruit being about half-an-inch in diameter. "Bot. Mag.," t. 8,184.

POTENTILLA CONCOLOR.

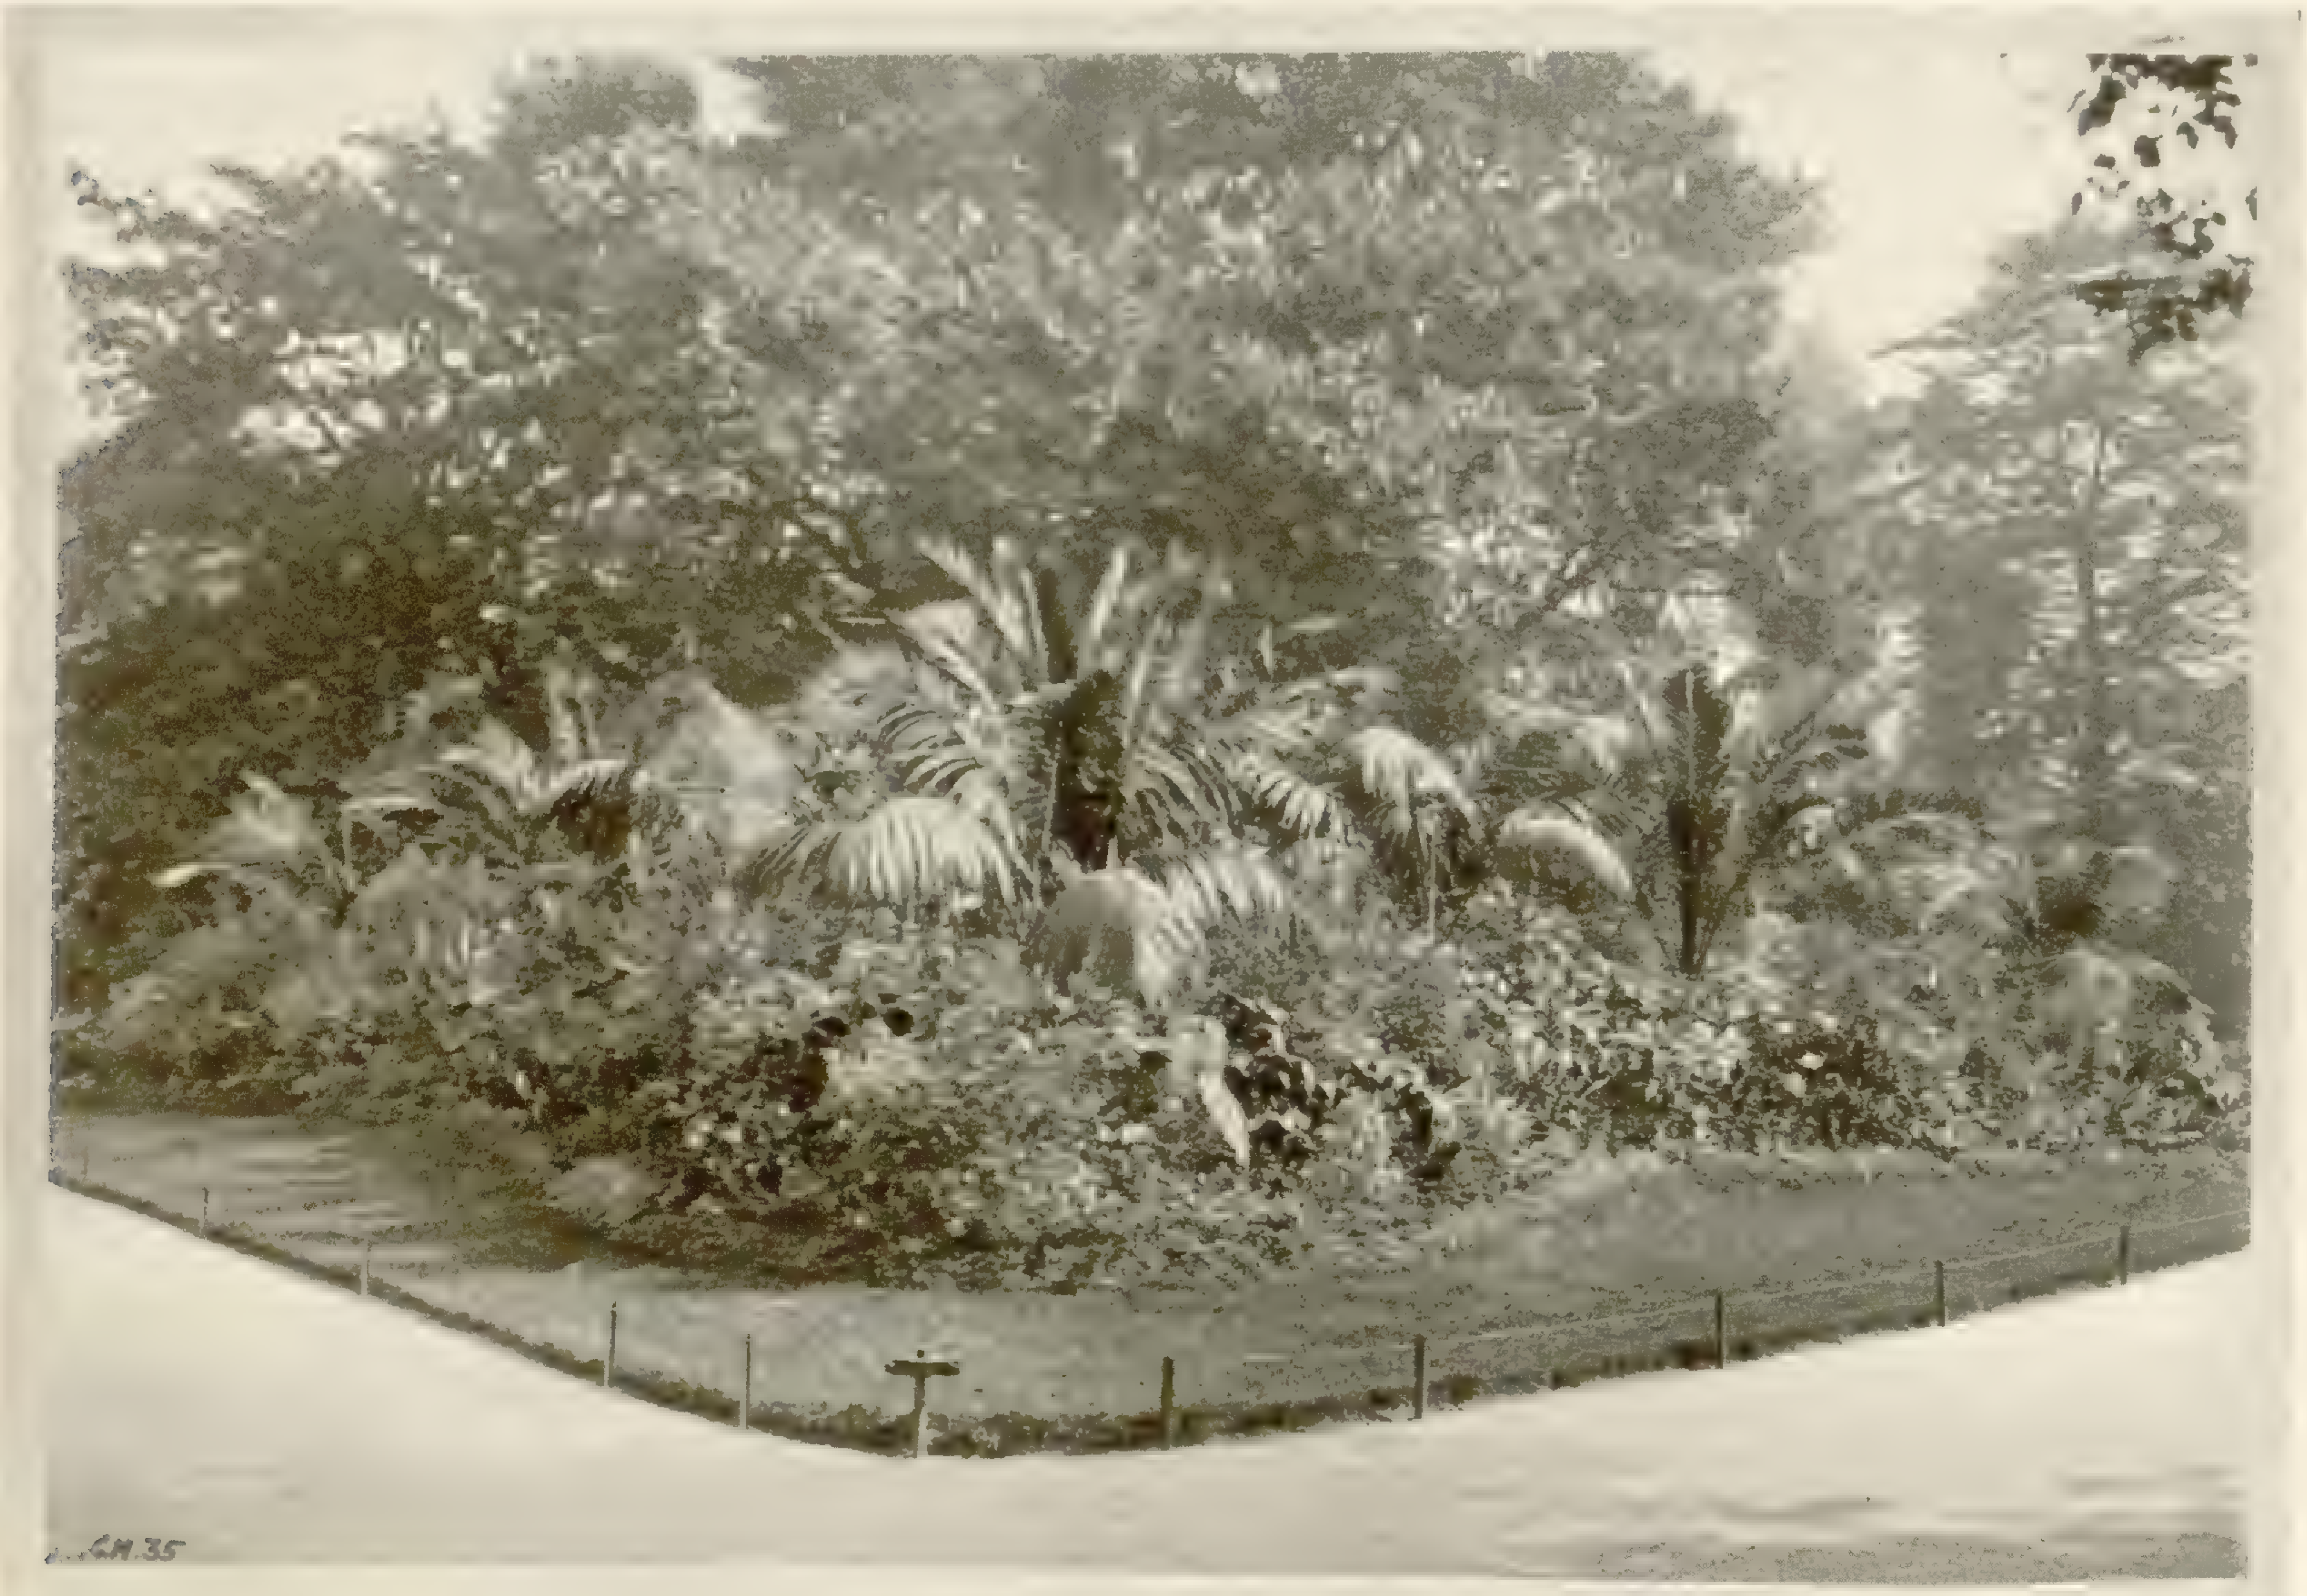
A handsome, useful, effective, and hardy species from South-Western China, and introduced to cultivation by the Messrs. Bees, Lim., Ness, Neston, Cheshire. It grows somewhat over a foot high, and bears bright golden-yellow flowers 1½ inches across. "Bot. Mag.," t. 8,180.

SUB-TROPICAL PLANTS IN THE GARDEN.

In the milder parts of the British Isles, and especially in well-sheltered positions, the use of sub-tropical plants in, or in connection with flower gardens and pleasure grounds, add an important feature to the attractions of the garden, in which they may be used in such a way as to form a pleasing contrast to the flowering plants. Beauty of form is at least equal to beauty of colour among plants; and as most of the foliage plants used are selected for their nobility, either of leafage or dimensions, or have some decided attraction in the way of contour and habit, from the elegant palms and massive musas down through the lesser subjects which form the group used in groups they should be the principal objects in such groups, and any plants used below them should be subordinate in every way. A little ingenuity in the treatment of the regulation "bedding plants" will give surfaces sufficiently broken in themselves and happier effects than when they are surmounted by plants of totally different character.

It will be seen from this that I favour particularly the grouping of our more massive plants by themselves quite away from the "bedding plants," and that they can be made very effective in this way is certain. In the case of fine individual specimens of palms and musas, these look well when springing as single specimens from the turf in a well-sheltered place, backed up by shrubs. Other things may be grouped very effectively, but the groups start, and require plenty of room from the time they are raised until the time when it is safe to plant them out, as each plant should be a perfect specimen, and be kept as such, which requires careful nursing and free root action from start to finish. In all but the huge public parks and gardens or the larger private gardens the accommodation for such things is generally very limited, and where this is the case the amount of sub-tropical gardening should be limited also.

For the various palms, of which Chamærops humilus, Livistonia australis, and L. chinensis, Phœnix dactylifera, Seaforthia elegans, Trachycarpus excelsa, and T. Fortunei, etc., winter storage of considerable capacity must be provided, and the same may be said of the various tree ferns, Alsophila australis and A. excelsa, Cyathea



A BOLD AND HANDSOME SUB-TROPICAL EFFECT PRODUCED IN REGENT'S PARK IN 1907.

known to us as sub-tropical plants, no apology is needed for their introduction into suitable positions where they are not incongruous, and where they may be shown in a more natural way than they are seen when cooped up in houses in which perforce the majority of perennial tender plants have to spend the greater portion of their time in this country.

Needless to say, the choice of suitable positions, or positions which seem suitable to individuals, vary largely even after making sure that the requisite shelter and warmth during the summer season has been secured. Personally, I must express the view that the method of using them as "dot" plants over groups of the usual run of dwarf-flowering subjects is to me quite distasteful. One reads of their value for "breaking up" the flatness of beds filled with dwarf-flowering plants, but to my mind the remedy here is worse than the disease, for the subjects do not mingle well. If massive foliage plants are to be should not be mixed in such a way as to destroy the individuality of the various species used. It is far better to use fewer species than it is to confuse the eye by planting too many species in the same group, and rather than do this I would go to the other extreme, forming each group of few species and confining these to plants that have much in common.

Of course, all this is a matter of individual taste, and it must be left to the grower to do his best under the circumstances presented to him, and to provide the cultural details and all that pertains to successful culture for, after all, good culture tells almost more than anything with the value of such things in the garden.

Sub-tropical plant culture for garden effect is not a thing to be lightly entered on, without thought. The accommodation under glass must be considerable for the perennials, and also, even for the annuals, such as the wigandias, ricinus, solanums, and others, for these must have a good dealbata, and Dicksonia antarctica, Musas ensete and M. superba, and the various cordylines used. Other subjects, such as tender bamboos, erythrines, aralias, ficus, cannas, phormiums, agaves, eucalyptus, etc., have also to be provided to have the various subjects well represented, so that it may be readily understood that sub-tropical gardening, when carried out to any extent, is a severe strain on the resources of the garden.

Some of the subjects which may be chosen are hardy, or nearly so, and few gardens need be without their specimens of gunnera, yucca, rheum (in variety), Crambe cordifolia, and, in fact, scores of other plants which are attractive from the foliage point of view, and well worthy of cultivation as such, but no method of planting that goes to destroy the individuality of the plant should be entertained by those who wish for the best results.

J. C. Tallack

Shipley Hall Gardens.

PANSIES.

There's rosemary, that's for remembrance, pray you, love, remember; and there is pansies, that's for thoughts.
Hamlet iv., 5.

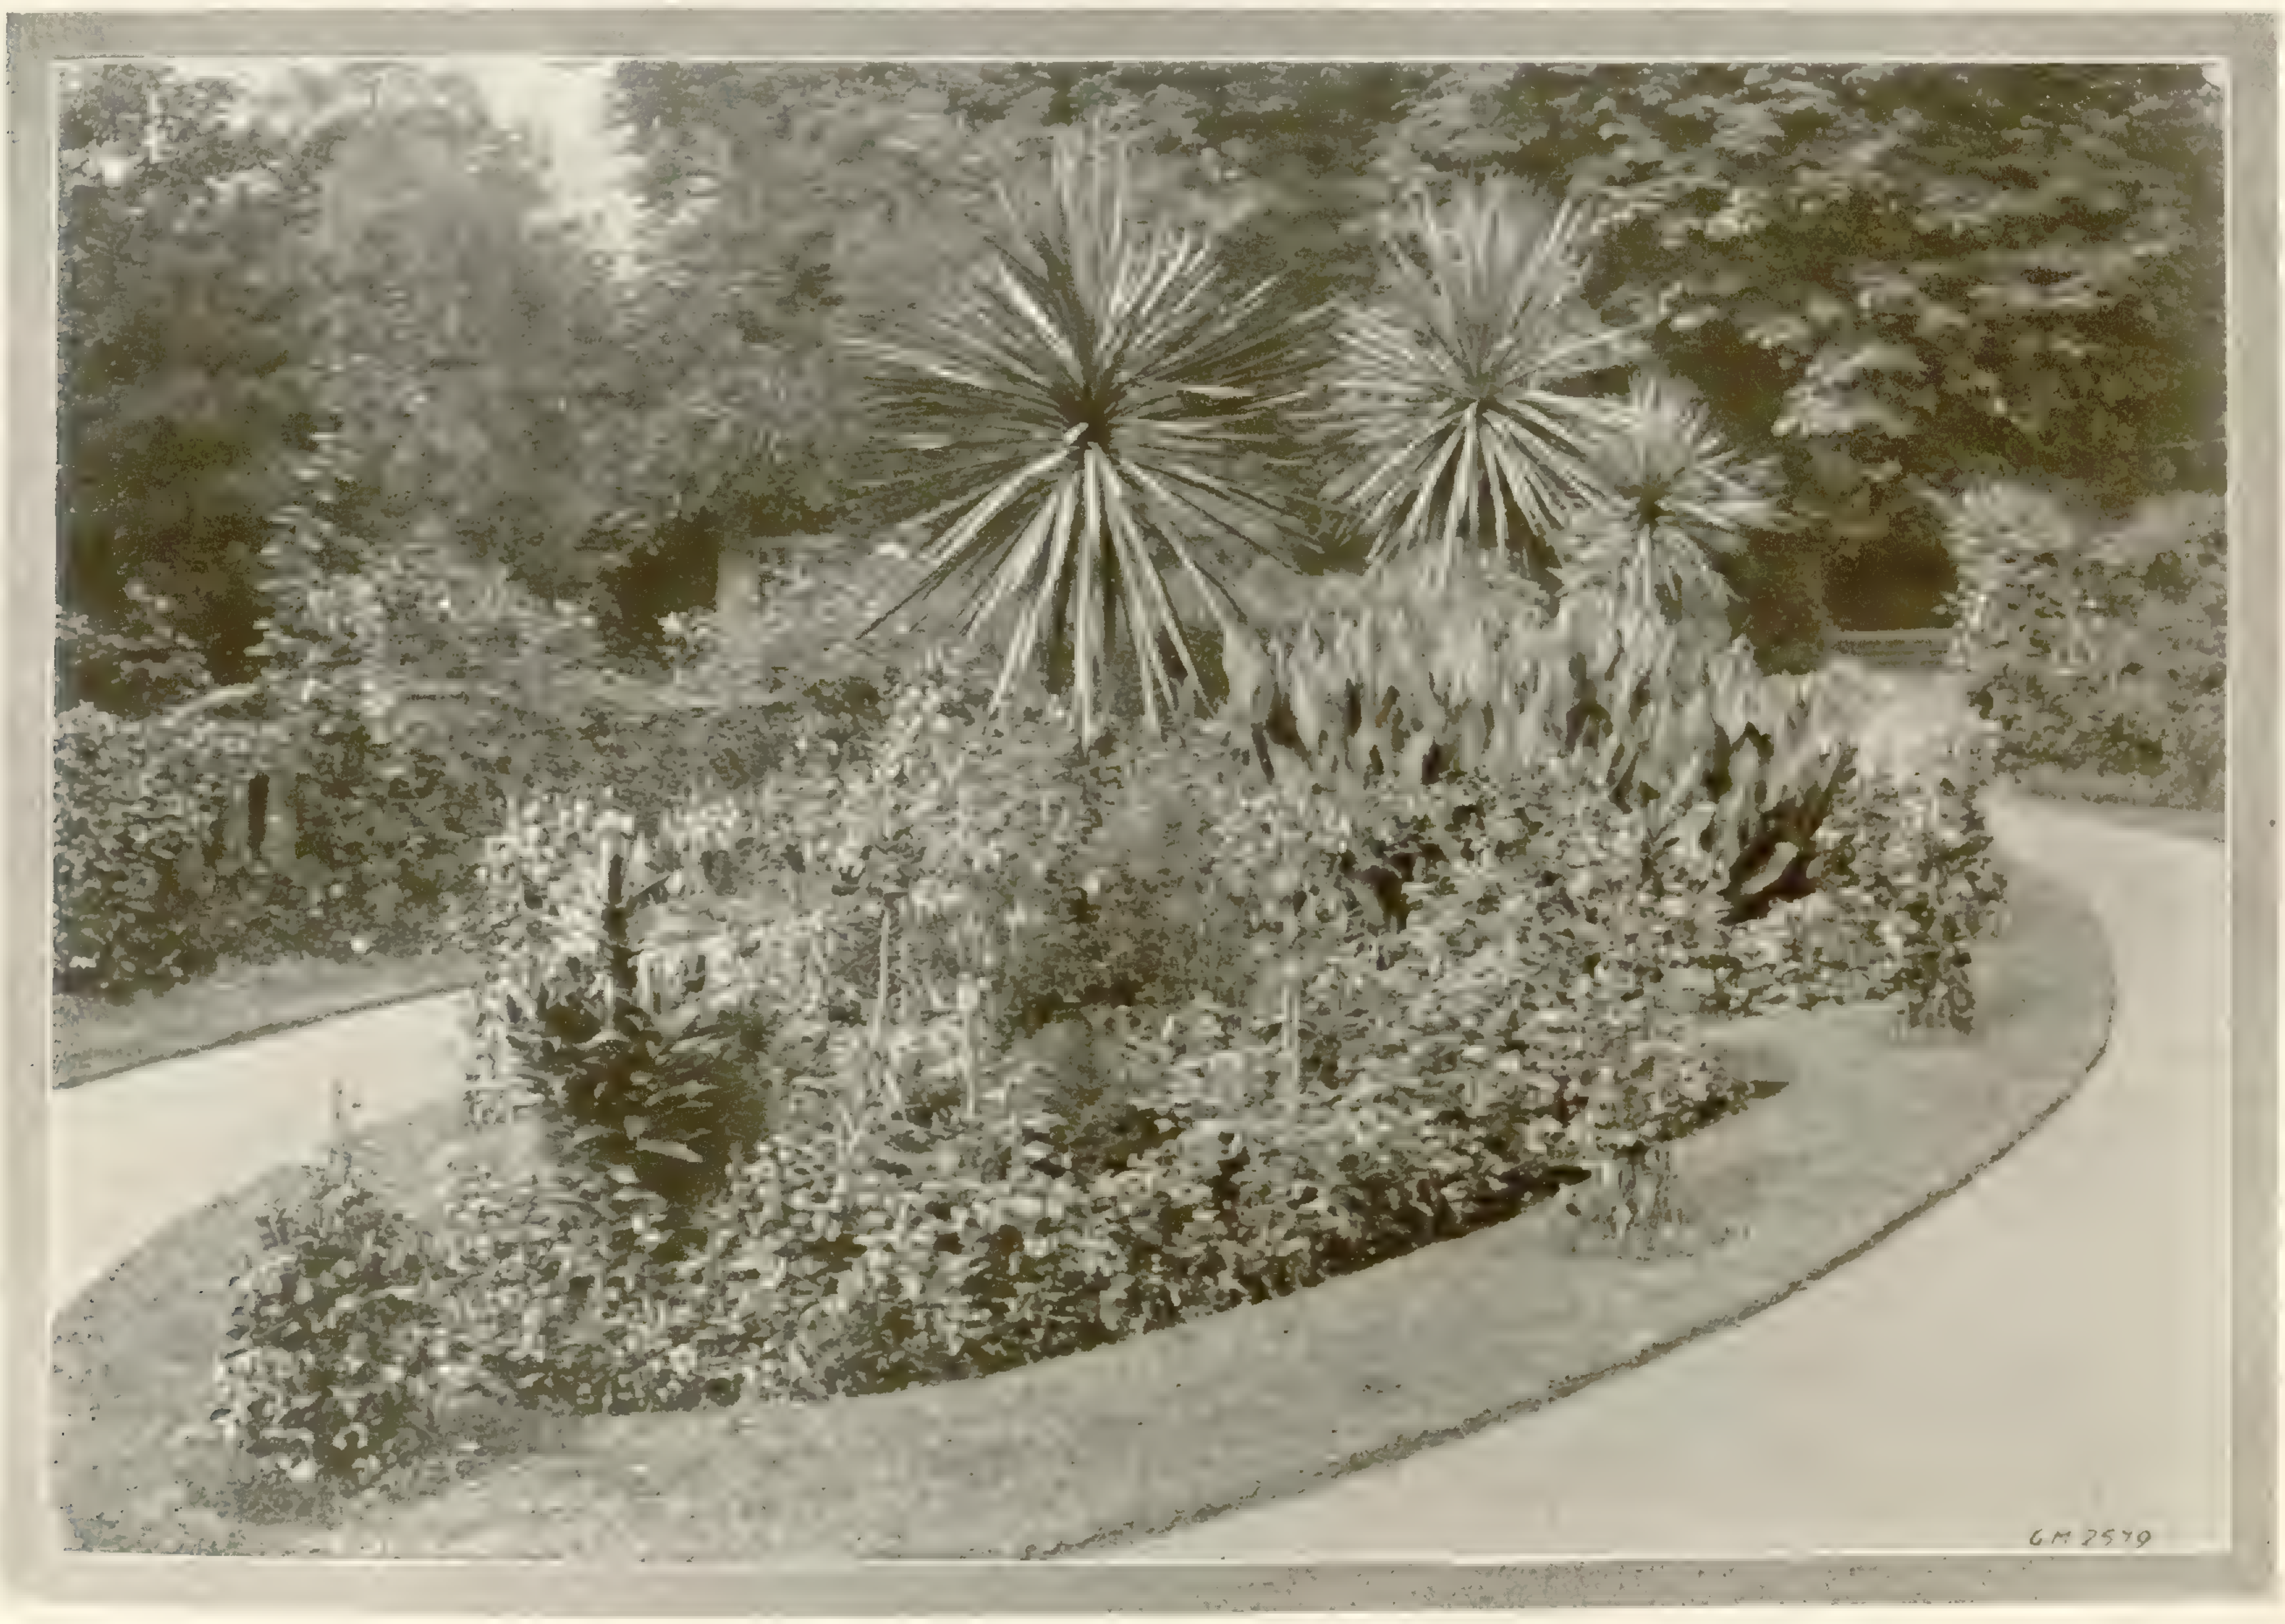
Pansies of a good strain are essentially florists' flowers, and the ability to pick out good blossoms from a crowd of common ones is the work of a true florist. The ordinary amateur regards all pansies as pretty, as they undoubtedly are; though to one who knows, the common types of the flower only serve as reminders of the finer forms, and make him regret that people should grow inferior varieties, and be content with them. The immense popularity in recent years of the tufted pansies (usually known as violas) has done not a little to lessen the growing of the older form of pansy, especially in the South of England, where dry, hot summers are so often unfavourable to success with it; but the latter will always have a place of its own in our gardens, though it is rash to prophesy at any time about fashions in flowers as in anything else.

The pansy is easy to grow, for we grew it in our little gardens in our childhood, and we see it in cottage gardens everywhere to-day. But to grow the best strains, and to grow these to perfection, requires liberal cultivation and certain conditions, namely, a deep rich moist soil, and, in the South of England, partial shade. I remember as a boy seeing my father having a flower bed dug out to a greater depth than I was high, and barrow loads of good soil put in to replace the yellow clay taken away, while the pansies which grew on that bed afterwards so impressed my boyish fancy that I remember them still. Whatever the natural character of the soil, the aim must be to give the pansy a soil which is deep, richly manured, and capable of retaining moisture, the latter condition, especially if the soil is a light one, being helped by the use of cow manure.

One cannot always depend upon getting a really fine strain of seed, partly because the pansy has a strong tendency to revert to its less highly-bred ancestors, and partly, perhaps, owing to a practice I have observed in some seed grounds of growing the finer sorts mixed with inferior ones, and presumably saving the seed from all alike. As the common sorts seed so much more freely than the choice ones, it is not to be wondered at that often such a very small minority of the seedlings are of much value. One indication of the character of the seed we buy is the quantity of it, a large quantity of seed of the best sorts never being given even in half-crown packets, as they are such shy seeders.

Seeds should be sown in early July, in light soil composed of leaf mould, rotted turf, and sand, and the pans set in a cool, shady place either in a house or cold frame, care being taken that the young seedlings do not get drawn up, as this is an awkward time of the year to raise choice seeds successfully. The seeds should be sown very thinly, even being put in separately if there is very little of it. When in the third or fourth leaf they should be pricked out into pans or boxes, making two operations of this, as some seedlings will be much in advance of the others, and it is from these latter that we may get the choicest sorts. An object to aim at is to get the plants well established before the winter sets in, and this in the beds in which they are to flower, when they are not likely to be injured by any ordinary winter. Should the winter be of exceptional severity an inverted flower pot over each plant will give all the shelter necessary. If the bed or border for them is not likely to be ready before late October it would be as well to plant them out from the pans or boxes in late August or early September, and then move them again with a good ball of earth. If the ground has been properly prepared they may be put out a foot apart, as the pansy is a greedy feeder and exhausts the soil of both food and moisture within a considerable radius.

The plants will grow right through the winter, except in severe weather, and good fat buds will be showing in March, producing some fine blooms in April. When planting in spring the results are not nearly so good, especially if the season is a dry one, the finest blossoms usually being produced in early May, which is before spring-planted pansies have had a chance to get well established. The quality of the blooms begins to deteriorate rapidly in the South of England when hot weather sets in, and as soon as this begins it is best to pick off all the blooms and buds and give a liberal top-dressing with rotted manure and turfy loam, followed by a thorough soaking. This may be followed after a week or so with liquid manure, when fine blossoms will again be produced. A repetition of the process when the plants again show signs of exhaustion may prolong the flowering season through the autumn, beautiful flowers sometimes being produced at Christmas in an open season. In the dampness of autumn, however, slugs must be guarded against, as they are very fond of the blossoms, and a single bite spoils the beauty of a bloom. The renovation of a bed of pansies may be arranged so that they are at their best just when we want them to be, it being convenient, for instance, to do it just before going away



ARRANGEMENT OF FLOWERS AND FOLIAGE AT GUNNERSBURY HOUSE.

from home for a time, so that they are in full beauty when we return.

The amateur making his first attempt at growing pansies of the finest strains from seed will be unfortunate indeed if he does not get a few which he will desire to propagate, and it is safer to rely upon cuttings than upon seed, even when the seed is saved by oneself. The best time for propagation by cuttings is July and August, the former by preference, and the best material for the purpose is obtained from the young growths from the centre of the plant, which, if pulled out carefully, will generally have some rootlets already formed or about to be formed, and quite a number of these may sometimes be obtained from one clump. Some put them in sandy soil in a frame, while others dibble them in rows on a border in a shady position, and keep them moist for a week or so, remembering that slugs and snails are very fond of them at this stage. In October they should be strong enough to plant out in their permanent positions, where they will begin to flower early in the spring.

If some favourite sorts are scarce, the old clumps may be cut up in October or February, each piece with a root attached being planted separately, and these will make fair plants the following spring, though sometimes rather straggling, and they will not produce such fine blossoms as those which were struck in the summer.

Many prefer to buy plants of named sorts, instead of going to the trouble of raising seedlings with its doubtful results and somewhat long period of waiting. If we buy them from some leading nurseryman who keeps a good named collection, it is more satisfactory to make a list of those varieties which have taken our fancy at the exhibitions rather than to leave it to the nurseryman to send so many sorts at so much a dozen. It is best to get these in the autumn if good results are expected the following spring. Another method is to buy plants in flower as displayed in the shop windows, costers' barrows, etc., which has the recommendaton of enabling us to choose our own sorts as regards flower, though possibly not true to name. Generally these are displayed too late in the season, April to May, for any good results to be obtained the same year, and it is better to plant them in good ground in a rather shady place, keeping the blossoms picked off and the plants well watered, so as to encourage the growth of suitable material for cuttings as described above, when a very good stock may be obtained for the next year.

No attempt has been made here to give a list of the best named varieties, as so few people, comparatively, know them as named sorts. It may be mentioned here, however, for the benefit of the uninitiated, that florists' pansies are divided into two classes, the Fancy or the Belgian, and the Show or English, the latter being further divided into three sections, white ground, yellow ground, and selfs. Alger Petts.

Gardeners' Sick Children.—An appeal is being made on behalf of the funds of the Hospital for Sick Children, Great Ormond Street, W.C., in connection with the opening of the new wing by Her Majesty the Queen in June. This new wing is for out-patients, and has been built by Mr. W. W. Astor, in memory of his late daughter. Mr. S. Johnson, the secretary of the hospital, informs us that in one year no fewer than 123 children of gardeners were treated at the hospital; any assistance in cash, or in kind for the bazaar, will be thankfully received by Mr. Johnson.

AMERICAN CARNATIONS.

The American interest in the perpetual carnation is still unabated, new varieties are constantly being raised, and subjected to critical trials, in the hope that they may surpass the standard varieties. It is worthy of note that many of the newer sorts are rapidly ousting older varieties from popular favour, and the grower who would be up-to-date in carnation culture must be fully alive to the happenings in the carnation world.

The successful début in this country of Beacon, Winsor, Aristocrat, etc., will pave the way for the varieties which are to follow them. The most one can do is to keep in touch with these newcomers, give them a sound trial if possible, and compare notes with the especial favourites of one's collection.

Probably the grandest of all carnations of recent origin is Afterglow, a splendid Lawson shade of pink, which was shown with such marked success at Washington. Its career from the fall of 1907 up to the present moment has been one series of triumphs, as it scored at Rhode Island, Philadelphia, St. Louis, Indianapolis, etc., and won four notable prizes at Washington. It also gained a silver medal at the Boston Spring Show, and the cordial approbation of the judges, who regarded it as "first class in colour, form, length, and stoutness of stem."

Another splendid novelty which will appeal to many growers is Andrew Carnegie, which can best be described as a scarlet Harlowarden, with the same free open habit and floriferous character as that standard crimson. It is not often that we get such useful sorts, and one may be sure that Andrew Carnegie will be welcomed on this side of the Atlantic. A good scarlet, which is noted for its clear colouring and fine form is Defiance, an attractive medium-sized variety, which is credited with being very free. An extended trial should be accorded to Welcome, a newcomer of the Lawson type, which carries the same shade of pink as Winsor, and has stems as long as Enchantress.

Speaking of Enchantress reminds me of the various white forms which have arisen from time to time, but which have not made much headway in this country. It seems, however, that there is a vast deal of difference in them, but Messrs. Pierson, of New York, have probably the best type (this met with the approval of the committee at Washington) in a good-all-round carnation of spotless whiteness. In May we note a serious rival to Enchantress; it is a charming light pink, free, of good size, and with long stems. As yet it is not greatly known, but good prices are obtained by growers for the blooms. Red Chief, which I have noted in a previous issue, is popular, on account of its throwing a heavy crop of blossom at Christmas, though for continuous flowering the orange-scarlet Beacon is exceptionally useful. Another scarlet, Mrs. George A. Frost, has been certificated at Boston, and gives promise of a useful career.

A goodly number of carnations were displayed at the recent Boston (U.S.A.) Spring Show, and it is worthy of note that the older varieties were well to the forefront. In the dark pink class Mrs. Lawson secured the two leading prizes. Harry Fenn (which seems at its best during the spring), took first and second for crimson, the old Octoroon being third. The pale-pink group resolved itself into a struggle between Enchantress and Winsor, the former securing first place. Of the scarlets it was Victory all the time, this famous variety sweeping the board. Lady Bountiful proved the best white, closely followed by White Perfection. For the best vase of 100 blooms, Helen Goddard took the lead, proving that so-called secondary varieties are often worthy of more attention.

These competitive classes for carnations have a distinctly educative interest, and help to popularise this most charming section of the carnation family. It only remains to be added that, as yet, the private growers in this country seem to fight shy of carnation exhibiting (as far as the perpetuals are concerned), a fact which one can but deplore, seeing that the trade growers make such good displays, and are doing so much to further the interests of the perpetual carnation. P. S. Hayward.

SAXIFRAGA BOYDI ALBA.

Although I always deem it right to express my regret that this beautiful saxifrage has been called by a name which leads us to infer that it is a white counterpart of the scarce, but charming yellow-flowered S. Boydi, it is so valuable that one cannot refrain from writing a note upon it at present. It is much freer and easier to grow than S. Boydi, which is now most difficult to obtain, only a few nurseries possessing a stock of this charming flower, and it is now little cultivated in the south. S. Boydi alba may, however, be placed in a different category, as it is a good grower, and is, in this, superior to that valued early saxifrage, S. Burseriana. It is more robust, more vigorous in every respect, and it does not seem so liable to that failing of S. Burseriana, its becoming brown and dying off in the centre. It is also fully earlier with me, and even in this dull winter came into bloom in January, flowering also at the same time in the garden of a friend a short distance away.

But, although more easily cultivated than S. Burseriana, I have discovered that it is greatly improved by covering it with a sheet of glass elevated a few inches above the plant by one of Wood's glass holders or some other suitable support. This is not only kept over the plants in winter, but in summer as well, and the most suitable situation seems to be one which is partially shaded from strong sun. My best plant is one well raised on my rock garden, planted in a hard and gritty loam of poor quality, shaded from the sun by taller plants, and covered with a piece of glass on Wood's glass holders. All the year it is the picture of health, and from early in January flowers had begun to open. These blossoms are pure white, and equal in size to those of any of the Burseriana varieties. D.

Salvia Pride of Zurich.—We have now several forms of the Brazilian Salvia splendens, and the typical kind as well as the varieties have long been justly valued as flowering plants for the greenhouse Late summer and autumn, however, are usually regarded as the flowering period of this member of the sage family, but in the variety at the head of this note we have one that can be had in flower during the spring months. This is fully borne out by the fact that at the last two meetings of the Royal Horticultural Society Messrs. H. B. May and Sons, of Edmonton, have shown numerous examples of this salvia thickly studded with their bright scarlet blossoms. For summer bedding Salvia splendens has much in its favour, but up to now its comparatively late season of blooming was a decided drawback. With this compact-growing and early variety, the just-named difficulty will disappear. As Salvia splendens is of easy propagation and culture, this newer variety (for it is not absolutely new) should soon be generally met with in gardens.—W. T.

THE APRIL SNOWSTORM.

As in many other parts of England, the fall of snow at Foots Cray was very heavy, and quickly enveloped trees and shrubs, and, indeed, vegetation of all descriptions, in the folds of its white fleecy mantle. The fall in the south, as in the north, was so heavy as to cause considerable inconvenience by the stoppage of some of the means of locomotion, and to give rise to considerable apprehension as to the safety of coniferous trees and evergreen shrubs on which the snow had effected a lodgment. Notwithstanding the inconvenience and the anxiety to which the snow gave rise, one could not help admiring the delightful pictures it produced in gardens well furnished with trees and shrubs. Our friend, Mr. C. E. Shea, was not slow to recognise the possibilities of picture making which his delightful gardens at Foots Cray afforded, and promptly taking advantage of his opportunities he obtained some beautiful photographs. He very kindly sent us a selection of his studies in snow scenery, and, with his customary kindness, readily acceded to our request to publish some of them. Mr. Shea also sent us a note on snow photography which we are well assured will be much appreciated by those of our readers who include photography among their hobbies. Photographing snow scenes is so extremely difficult that the advice which so expert a pictorial photographer as Mr. Shea can give is especially welcome. The chief difficulty in photographing snow is to retain its texture, as is so admirably done in the examples that we have the pleasure of reproducing herewith, and thereby avoid the large areas of white paper, and the black shadows that are so common in pictures of snow scenes produced with the aid of the camera.

A SNOW SCENE IN "THE ELMS" GARDENS, FOOTS CRAY, APRIL 25.

Snow photography is one of the most difficult branches of a very fascinating art. I say art, although pictorial artists deny that photography can be legitimately included in the term, a proposition which I distinctly deny. As with every other branch of photography, excellence is only to be obtained by a correct realisation of the true standard which alone should be accepted as correct. The two essentials of a typical snow photograph are "texture," as it is called, in the snow, and at the same time detail in the shadows. The fault of many snow photographs is that the snow has no gradations, and the shadows are almost jet black--the result of under exposure. Many, if not most, snow photographs are taken as snapshots, with the above result. To procure gradations and texture in snow a slight, and only a very slight, over exposure is essential. This, followed by a slow and carefully "restrained" development, is the secret of success. To obtain this correct over-exposure a "time" exposure is absolutely necessary, a very small "stop" being required to permit of this. Of course, under certain conditions of intense light a snapshot exposure may give what is wanted, but this is a chance result. To make the required result a certainty the course which I have indicated is the true one. Of all schools for snow photography the experience gained in the High Alps is perhaps the best. Charles E. Shea.

SHADOWS ON THE SNOW, "THE ELMS," FOOTS CRAY, APRIL 25.

THE CROCUS TULIP.

One of the brightest of the tulip species is that sometimes called the Crocus, or Celsius's, Tulip (Tulipa australis, syn. Celsiana), a pretty little plant which has never yet received the due recognition its merits would justify, and which might be more frequently utilised in quantity in the gardens of the many, whereas it is at present only met with in those of the few who are especially devoted to hardy bulbous flowers. It deserves a better appreciation than this, as it is one of the prettiest and most showy of the really dwarf species, particularly where it is in full sun, when its large flowers spread out almost flat, and resemble some magnified yellow crocus. When the flowers are closed they are interesting also, and the exterior tinting of reddish-brown and green is then well in view. The flowers are smaller than those of some of the more popular species, but they are quite large enough for the stature of the plant, which is from six to eight inches, and even a few more inches.

Tulipa australis is one of the stoloniferous species, and where it is happy increases with fair freedom.

The Crocus tulip is a native of the South of Europe and the shores of the Mediterranean, and in cultivation requires a warm and sunny position in a light and rather sandy soil. Here it should be planted about two inches deep, the bulbs being set about two or three inches from each other if a close clump is desired. It is a charming little tulip for the rock garden, and does pretty well in the border, but it is not sufficiently robust to hold its own well in the grass, which would be its best situation were it amenable to this method of cultivation in our climate. A bright little flower, T. Celsiana is now obtainable at a moderate price in autumn, when it should be planted. It opens in the early days of May, as a rule. S. Arnott.

Horticultural Club.—Owing to the annual dinner of the Gardeners' Orphan Fund being held on Tuesday, the 12th inst., and to the first day of the Temple Show being on Tuesday, the 26th inst., no house dinner of the club will take place during May. Dinner will be served at the club, at 6.30 p.m., on Tuesday, May 26, for those members who may wish to dine together after the show.

HYBRIDISATION OF ROSES.

The following paper was written by Mr. Alexander Dickson, of Messrs. Alexander Dickson and Sons, Newtownards, Ireland, and read before the American Rose Society in Chicago, March 27, 1908:

It was with considerable hesitation that I consented, at the request of your society, to write a paper upon hybridisation and cross-pollination in relation to the rose. I may say at once, it is a request that I have refused many times from similar organisations here and elsewhere, because I have always felt, and indeed still feel, it is a subject upon which it is extremely difficult to write a satisfactory paper. The subject is one which cannot possibly be dealt with satisfactorily in a paper such as the present, and the chief difficulty one has is selecting the lines upon which to write, or the point of view from which to discuss it. I will do my best to make the paper as interesting and instructive as I can within the limited scope at my disposal. I have given the subject my most careful consideration, and I am convinced that the best method of dealing with the subject in this paper is to give you, in a condensed form, some of the results which have accrued from the labours of my brother and myself, extending over a period of almost thirty years.

From a Practical Point of View.

I would ask those who hear this paper read, and those who may read it for themselves, to remember that it is written by a professional rose grower, and, therefore, by one to whom the practical results, from a commercial standpoint, were of the most vital importance, and of necessity this point of view had always to be borne in mind by my brother and myself in our line of experimental inquiry; and it is from this point of view that I deal with it.

Hybridisation is a subject of intense interest, and the practical application of the science opens up an infinite and even inexhaustible field of inquiry, but those of us who are professionally engaged upon this branch of horticulture must abandon, to some extent at least, the scientific aspect, in favour of the practical. With the stern realities of life facing me, I have many times, contrary to my desire, been compelled to abandon scientific lines of inquiry, as against the production of new varieties of commercial value—a situation I regretted, but could not help.

After thirty years' steady and continuous work I am inclined to the opinion that the further one pursues the subject of hybridisation, the greater the field for exploration. I have often thought, while pursuing my work and watching the results, that the effect was much like that produced when climbing up a steep mountain—the farther one rises the more the plains below are opened up. I will try to explain more fully as I go on exactly what I mean, and the foregoing observations are made with a view to render less keen the disappointment which I feel will inevitably follow the reading of this paper.

Much Due to Chance.

I am conscious that my observations will be read before, and by, men of practical experience in horticulture, and particularly in the culture or advancement of the rose, and by men keenly intent upon the development and improvement of the rose; and I am sorry, for this reason, that I can give little practical assistance to those who are desirous of entering the field of hybridisation on their own account. I may, however, render their disappointment less acute. The main reason why I can render little practical help is that, when all is said and done, hybridisation is a science of pure experiment, or rather chance, as I can easily show. To do this it is only necessary for me to assume that everyone—at least everyone interested in horticulture—knows that, so far as seed-bearing plants are concerned, they will reproduce their kind in some shape or form, perhaps with some variation, or perhaps exactly similar. And it follows that by the fertilisation of different varieties of the same species, new varieties, or, at least, varieties with some distinctive feature, may be produced. It is a different matter, however, to reduce the chaos which results from indiscriminate cross-fertilisation to something like definite order—a result far beyond my ambition or the scope of this paper, if indeed it is at all possible. All I can do in this direction, and indeed it is very little, is to give some results of our labours in hybridisation.

Early Discouragements.

We began work in 1879, and naturally our first operations were upon what were considered the finest show varieties of that day. Naturally, we chose parents of the choicest colours, having beauty of form, and, as far as possible, vigour of habit. The hope, of course, was that the fertilisation would result in varieties of a different kind, with at least some of the qualities for which the parents had been selected. The results for many years were disastrous.

Keen and bitter disappointment followed our experiments. We, however, persevered, always upon fixed lines, carefully recording our crosses and results, making a close and careful observation of the most important features of the offspring of the cross; and I regret to say that in the majority of instances there was nothing but dismal failure to record. I think I can safely say that the most certain result of our crosses in the early stages of our experiments was to convince us of the absolute uncertainty of what our results would be.

This prevails even now, though in a lesser degree. Possibly this is one reason why rose hybridisation is so intensely interesting. There is always and ever the element of uncertainty in it, so dear to human nature. One never knows what the fertilisation of any two varieties will produce, or, more correctly, how many different varieties. One seed pod containing four seeds may produce—and has produced, to my knowledge—four seedlings absolutely distinct in every conceivable respect. Many and many a time I have seen produced from the seeds sown from one hip half a dozen seedlings, absolutely distinct in colour and form, some as single as the ordinary dog rose, and some so full in substance that it was impossible to get them to open even under glass.

A Change of Method.

In the early eighties, when we began to see the results of our labours, we abandoned the original basis of our experiments, namely, the fertilisation of the better varieties of hybrid remontant or perpetual, and began a series of cross-pollination between the hybrid perpetual and teas and Austrian briars, and then using the results of this first cross in a systematic course of inbreeding. The main object which we had in view was to produce varieties of roses at once vigorous in their habit and continuous in their bloom, at the same time retaining the absolute essentials of all good roses; namely, beauty of colour, perfection of form and delicacy of perfume. It was, of course, a great ambition, and how we have succeeded we must leave the world to judge. Broadly, I would say that such success as has attended our labours is due far more to the careful selection than to any defined plan of fertilisation.

As a broad basis of our experiments, we took as parents such varieties as appeared to us to embody the chief elements of our ideal, and worked steadily from these. We had, of course, to experiment upon a very extensive scale, and my point will be readily appreciated when I say that we were only able to retain for use, either for further fertilisation or for commerce, about five per cent. of the seedlings raised.

To appreciate the labour this entails upon the hybridiser, one must follow the rose from the hip until it reaches maturity. In hybridisation, carried out upon a systematic plan such as ours, it means that the plants with which we are working have to be specially selected, planted, and grown, and the blooms fertilised. There is then the period required to ripen the hip, and in Ireland this takes considerable time, owing to the cold and dampness of our climate. Then comes the sowing of the seed, and the attention and care during the period of germination.

In this respect it is interesting to note the wide differences in the period of germination in the different cases. In some instances the seed will germinate in two or three months, and in others I have known it to lie dormant from twelve to fifteen months. I have never been able to give any reason why this should be so, and, particularly, why there should be marked differences in the periods of germination in seeds taken from the same hip; yet there is very frequently a marked difference.

Danger of Rash Judgment.

To continue on the point I am making, it takes any time from three to six months, according to the vigour of the plant, to bring it to such amount of growth as will enable us to bud it for the purpose of testing outside. Then, when it is budded, of course it takes a full year to bring the plant to maturity. Here, again, one has to face uncertainties, and to be very careful about forming a judgment, as experience has proved time and again that in the early stages of culture some varieties have displayed the greatest shyness in flowering, and yet, after a few years' cultivation, have taken their places in the front rank as perfect garden roses, blooming with the greatest freedom.

Each year we are compelled to make a very close selection, and to discard every seedling which does not suggest some improvement in at least one or two of the essential elements of the perfect rose; otherwise we would, of course, have been flooded out with varieties which would have been of no practical value to us, or, indeed, to the rose world at large.

An Exact System of Experiments.

The system we ultimately adopted was hybridisation, in the first instance, between hybrid perpetuals and teas, and then inbreeding from their offspring, upon the following lines: We made four distinct crosses. We took a seedling of our own, which gave some evidence of possessing at least some of the qualities aimed at, and in the first instance this seedling was crossed with the male parent; secondly, the seedling crossed with the female parent; thirdly, the male parent crossed with the seedling; fourthly, the female parent crossed with the seedling.

As soon as we were able to form an opinion of the results of this interbreeding, we again made a selection of those most closely approaching our ideal, again inbreeding, [illegible] with this difference, that we only made use of a limited number of parents, but in almost every instance making a double cross.

For example, if we made a seedling with, say, Marie Van Houtte as the male parent, then during that season we reversed the cross, making Marie Van Houtte the seed-bearing parent, and the seedling the male parent. We always had relays of plants prepared in duplicate for this purpose, and we carefully and methodically registered each experiment, thus carrying on our work in a systematic manner, the system of selection, of course, always playing the most prominent part in the results.

Gratifying Results.

From practical experience, we were able to ascertain which varieties, or rather types, gave us the best results, and we were, therefore, able to a considerable extent to lessen the waste, and to reduce our methods to a system containing at least some element of certainty. Of course, we have [illegible] of varieties of other raisers, where we have been struck by any special features which they contained, which were, in our opinion, an advance upon anything in commerce.

The result of our labours has been to produce what is admittedly an absolutely distinct class, if not family, of roses, known as the Alexander Dickson type. We, of course, claim that the type of roses we have introduced have made a great advance on those previously in commerce. We aimed at producing a type having vigour of growth, freedom and continuity of bloom, the flowers full and perfectly formed, with unusually long petals, at the same time growing on bushes the foliage of which is luxurious and handsome. How far the varieties we have sent out have done what we claim for them you must judge.

Work with La France.

In our experiments and in struggling with the qualities we have indicated, we felt convinced that La France would prove one of the most useful parents we could possibly have, if we could succeed in making it produce seed. It was, of course, the opinion of most hybridisers that La France was sterile, and with this opinion we were for a long time inclined to agree, and indeed the best that could be said for it is this, that there is just the possibility that it may be fertilised. Out of many hundreds of crosses with this rose, only in one single instance did we succeed in making it produce seed, but we feel that the labour we spent was amply repaid, as the ultimate result of it was the introduction of Mrs. W. J. Grant, known to you as Belle Siebrecht, in our opinion one of the finest roses in cultivation, at least from the Britishers' standpoint.

Some Notable Varieties.

In addition to this, we have always found from practical experience that the roses descended from this particular cross have always impressed their offspring with some, at least, of the more prominent qualities of the parents, and it was pursuing this particular line of breeding that enabled us to produce varieties which, from a British standpoint, are ideal exhibition flowers, and at the same time the plants are floriferous and of excellent constitution. In this group we might mention Killarney, Mrs. Edward Mawley, Bessie Brown, Liberty, Lady Moyra Beauclerc, Lady Ashtown, Mrs. David McKee, Dean Hole, Countess of Derby, Betty, Mrs. G. W. Kershaw, and, last but not least, Mildred Grant and William Shean, two of the finest exhibition roses at present in cultivation in Great Britain. Mildred Grant resulted from a seedling between Niphetos and Madame Willermoz in the first instance, crossed with a seedling of our own which is not in commerce, and the system of which this is an instance applies pretty generally to all the better classes of roses introduced by us.

The Long Sought Yellow Tea.

After many years of continuous experiment on various lines, we have at last been able to produce what has long been sought for, namely, a yellow tea of good size and colour with the vigour and hardiness of the hybrid perpetual. I refer to the rose Harry Kirk, which is now being grown by most of you, and you will shortly be able to judge whether it fulfils the promises we have made on its behalf. I think you will not be disappointed.

It is interesting to note, in relation to the La France cross, that the same inclination to sterility is apparent in the rose Augustine Guinnoisseau, a sport from La France. Out of hundreds of experiments we have not succeeded in getting a single seed pod from this variety.

Continuity of Bloom.

The only other point of practical importance which occurs to me, is the fact that in our early experiments, when we had in view the object of producing varieties which would give a greater continuity of bloom, we used in our efforts Rosa indica, and after a considerable amount of labour, we succeeded in impressing this much-valued quality on some of its offspring which are now in commerce.

In a general way, we found it very difficult, and indeed impossible, to place the smallest dependence upon the presumption that hybrid perpetuals would impart to their offspring anything of their own colour, and in a general way we may say that, after much experience, the chief varieties which we use, and use with the best results, for the purpose of getting blends, are the hybrid perpetuals, Horace Vernet, Charles Lefebvre, General Jacqueminot, and also Austrian briars, Persian Yellow, and Harrisoni.

From what I have said, you will readily appreciate the fact that it would be wholly impossible, and, indeed, I think, a waste of your time and mine, to give in detail the results of thirty years' hybridising, and I have done my best to make clear the general lines upon which our work has been conducted, from which it will be readily inferred that the element of chance must always play a prominent part, and I might aptly use the well-known quotation from Pope:

> All nature is but art, unknown to thee;
> All chance, direction, which thou canst not see.

And I ask such of you as may desire to enter for yourselves upon this interesting field of experiment, to go forward with confidence—

> Knowing that nature never did betray
> The heart that loved her.

BEETLE REVELATIONS.

(Continued from page 269.)

◆

Asparagus Beetle.

Growers of asparagus are frequently troubled by the doings of a rather pretty beetle a quarter of an inch long, with red back and faintly bronzy-green wing cases bearing large yellowish spots. It lays its eggs during the early part of the summer on the plants, and from them hatch green grubs with black heads and three pairs of feet, which would ordinarily be called legs. The grubs feed vigorously on the leaves and branches. Dressings of lime dust, paraffin solutions, and remedies of a like character should be adopted, but the best plan would be to capture the perfect beetles themselves by shaking them on to freshly tarred boards, papers, or cloths.

THE ASPARAGUS BEETLE.
Much enlarged.

JAMES SCOTT.

(To be continued.)

There is no better guide to the kitchen garden than VEGETABLES AND THEIR CULTIVATION, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

ANGULOAS.—The different members of this genus are advancing their young growths, and some are already producing their flower scapes, which make their appearance at the base of the newly-developing growth when it has advanced a few inches in length. With the yellow A. Clowesi there is little difficulty experienced in producing satisfactory flowering results, but with A. Ruckeri, A. eburnea, and A. uniflora difficulties are frequently met with. There can be no doubt that a great deal depends on the treatment the plants receive during the resting and dormant season. In the first place, I think, the principal cause is that the plants are too liberally treated during the resting period. When grown in the intermediate house, where the atmosphere throughout the year is generally kept reasonably moist, there is ample moisture to keep the pseudo-bulbs in a normally plump state without the use of the water-can. In the second place, when the new growths make their appearance water is afforded over-abundantly, and the plants are rushed into vigorous leaf growth to the disadvantage of the flowers. I consider that only sufficient moisture should be afforded at the roots to keep the pseudo-bulbs in a normal state, until the flowers are observed at the base of the new growth.

Repotting anguloas is best attended to immediately after the flowering season; the new growths are then emitting new roots, so that if potting is done then the plants are re-established in the fresh potting compost with the least prospect of injurious effects. They are robust-rooting plants and therefore require liberal pot-room. The pots used should be clean and filled to one-third their depth with clean broken crocks. Use a potting compost of about equal portions of fibrous peat, turfy loam, and chopped sphagnum moss, with sufficient sand and broken crocks to render the compost porous. Careful watering will be required until the plants become thoroughly rooted, after which every encouragement should be given to encourage development of growth.

LYCASTES.—Many of the early-flowering kinds, such as L. Skinneri, L. aromatica, L. cruenta, and L. Deppei, will have passed out of flower, and should now be examined with a view to repotting. I do not advise annual repotting for any of these so long as there is ample room in the pots and the compost is in a good state, but where the moss is dead on the surface this should be removed and fresh living moss be added. Where repotting is necessary care must be observed in turning the plants out of their pots, to avoid, as far as possible, any damage to the roots; these are very brittle, and more than ordinary care is necessary in the process of repotting. When the old compost has been removed cut away all dead roots, remove any useless back pseudo-bulbs, and in the selection of pots ample room should be afforded. A potting compost as described above for anguloas is suitable for the lycastes also. The cool intermediate house suits these plants best, but where the odontoglossum house is maintained at a temperature of about 55 degrees, the plants may be suitably accomodated there. H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

MUSA CAVENDISHI.—This stately and distinctly ornamental foliage plant is most effective and useful when cultivated expressly for this purpose. Where sufficient space is available for specimens they form an interesting addition to a collection of foliage plants. They may be easily propagated from suckers separated from the parent plants with a few roots attached, and placed singly in small pots; if plunged in a brisk heat they will grow away very freely. Musas succeed well in good fibrous loam with a little peat and sand added. The plants are extremely gross feeders and will soon require attention and repotting. If used for decorative purposes they are best cultivated in large pots or tubs, but if retained for fruiting I think they succeed best planted out in a specially-prepared border with ample drainage. During the summer months and when growing freely they require a good supply of water, and if the roots are at all restricted give frequent applications of diluted liquid manure. Keep the plants free from insect pests at all stages.

OUVIRANDRAS.—These curious and interesting plants are cultivated more as a novelty than for any practical use. They are commonly known as lattice-leaf plants and are stove aquatics, the leaves floating near the surface of the tank in which they are cultivated. Plants are raised either from seed or by division of the crowns, and should be placed in teak wood baskets filled with fibrous peat and loam with the fine soil taken out; these are then placed in the tubs or tanks and covered with tepid water. An important item in their culture is to maintain the temperature of the water as uniformly as possible at 80 degrees. Very little further attention is required if the water is kept sweet and clean and the foliage occasionally sponged.

POTTING.—Most of the potting in the stove will have been completed, with the exception of spring-raised stock, which may require attention, and ought to be taken in hand at once. When potting plants so late in the season much care must be exercised in dealing with the roots, or serious results will follow this operation. Those treated will require shading thoroughly from the sun and an occasional spraying with the syringe will be found beneficial. The sun now affords much heat during the middle of the day, so that careful attention to firing is very necessary.

POINSETTIAS.—Cuttings may be taken as soon as they have developed two or three inches of growth; these should be removed with a portion of the old wood attached and plunged into powdered charcoal to prevent bleeding. Place the cuttings singly in small thumb pots and plunge them in brisk bottom heat.

EUPHORBIA JACQUINIÆFLORA.—A further supply of cuttings of this useful winter-flowering subject ought to be inserted; select those growths which have been thoroughly exposed to the sun, as they are not so liable to suffer from damping. Plants are otherwise raised as advised for poinsettias.—JOHN DONOGHUE, Bardon Hill Gardens.

FRUITS UNDER GLASS.

FIGS.—Owing to the sunless weather figs have been long in ripening. Even pot plants have failed to ripen at the required time, and it will not serve the purpose to provide a higher temperature by the aid of fire heat or the fruits will drop. Give weak liquid manure occasionally, damp down when possible, and ventilate to prevent stagnant atmospheric moisture. As soon as the earliest crop is removed give copious syringings; and if the plants are in pots, and the house is required for some other crop, place them in another house, in a suitable temperature, for them to finish their growth, or to furnish a second crop in the autumn, which, if they are healthy and strong, they are quite capable of doing. In other fig houses the shoots should be well regulated and thinly tied in to ensure their ripening for another season; thin out the fruits if at all thick, and water carefully in dull weather. Figs in a cool structure are now showing up their fruit, and are most useful in the early autumn, both for exhibition and home use; these will need but little water, having no fire heat and a cool border. Even a few in pots should be left out for late fruiting, and the variety Brown Turkey is one of the best, though of this there are a good many varieties, and only the best should be selected.

YOUNG FIGS.—Cuttings placed three in a 60-sized pot last autumn are now growing away, and may be potted as they need it; give them good loam and a little soot, and they will give a few fruits next season. Plunge them in a bed of leaves in a cool frame, and keep them well syringed. Brown Turkey raised this way two years ago are now showing fruit; for keeping up a stock this plan has much to recommend it.

VINE EYES.—When sufficiently rooted the young plants from vine eyes should be potted in good fibrous loam and again plunged in the hotbed for a few days. When they get over the shift, place them on the stage of the melon house, where they will receive plenty of heat and moisture.

PLANTING VINES.—These required for planting while green at the end of next month should have a small shift if they are likely to become too root-bound by planting time, or they will not take readily to the new soil. Keep them steadily growing, with as much air in the house as can be reasonably given; when they are in full growth strong laterals will be thrown out, and this is then the best time to plant. Stronger canes that are required for fruiting next season should be also given a shift into good rough loam and half-inch bones; these may be grown between the rods in a house freshly planted, and where they will be required next season for carrying a crop to relieve the permanent ones, this method being preferable to planting extra canes and cutting them out in a few years. Muscats treated this way do well and give good returns for the trouble taken. Watering during the hot sunny days tells upon them most, as they do not like the constant soakings; this can be remedied by putting them inside other and larger empty pots or tubs.

PINES.—Those shifted last month into their fruiting pots will require plenty of attention in the way of watering and syringing. Once the ball of the plant gets dry no top waterings will soak it through; water with tepid soft water, because chalky water leaves unsightly marks on the leaves. Frequent damping during the day, if hot, will be required to keep plenty of moisture in the house or pit; ventilating should be done carefully and with a view to keeping the plants sturdy and healthy; close the structure according to the weather. The strongest plants should throw up in the autumn, and these should be looked over occasionally for white scale, using a piece of sponge tied on the end of a long stick to remove it. No more than one or two suckers should be left on each plant.—A. B. WADDS, Paddockhurst Gardens.

THE KITCHEN GARDEN.

POTATOES.—Give free ventilation to the latest crops that are maturing in warm pits, and add a little more soil to them if it is thought necessary, for they have a tendency to work themselves near to the surface, and they would soon become green if not excluded from the light. Let them have sufficient water in a tepid state to swell up the tubers, with an occasional dose of diluted liquid manure. The early batches of Sutton's Ringleader have proved most satisfactory.

CARDOONS.—It is always as well to have a few rows of this vegetable, in case it should be asked for, and now is the best time to sow the seeds. The best way of growing it is in trenches as for celery, sowing the seeds in a single line about a foot apart. If the weather is dry give the plants copious supplies of water when they are growing.

BEANS.—A few rows of French beans should now be sown on a somewhat sheltered border that has been previously trenched and manured, choosing an early variety, such as Webb's New Harbinger, followed by Canadian Wonder. The Dwarf Butter bean is a most useful kind to grow, and is quite distinct in colour from the other sorts, and is an agreeable change for the table. Should haricot beans be appreciated, a few rows can now be planted, which will give them ample time for the seeds to ripen before storing. Stir the soil with the hoe between the rows of broad beans, and draw a little soil to those more advanced in growth. Another sowing of the broad Windsor type should be made, which is of fine quality and a very free cropper.

PLANTING OUT.—Where the planting of such things as onions, Brussels sprouts, and cauliflowers was delayed owing to the wintry weather we experienced a fortnight ago, they should be put out at once, allowing them plenty of room, so that they may properly develop and grow on without a check.

BEET.—Providing the ground is in a friable condition, the main crop may now be sown, but there is no advantage gained by sowing before this date. The turnip-rooted variety for early use is now up and ready for thinning out. It is always wise to select ground for beet that has been prepared early in the winter, but by no means sow on recently-manured ground. Medium-sized roots are always more valuable than large ones, and of much superior flavour and colour. The seeds should be sown in drills about 1½in. deep, and drawn at a distance of 15in. apart. But if any are required for exhibition, 18in. between the rows will be not any too much, making holes with a bar, and filling these up with good soil, sowing two or three seeds in each hole, and thinning out to the best plant, when they have germinated. By this method much straighter and more uniform specimens are secured. Green Top, Volunteer, and Perfection are three good varieties to grow of the long kinds, while Crimson Ball and Reliance are two most useful sorts of round beet for use during the summer months, when salads are in demand.—T. W. BIRKINSHAW, Hatley Park Gardens.

Newly - planted Trees and Shrubs should be kept well watered and receive careful attention. The cold, dry, windy weather experienced of late has been very trying, especially to evergreens, and unless watchful care is given the percentage of deaths may be large. On cool, wet soils that do not part with moisture very rapidly the dry weather will not be so trying to newly-planted subjects, though with these an overhead spraying morning and evening will be beneficial. On light and gravelly soils it will be advisable to water often enough to prevent the soil about the roots becoming unduly dry. Clear water only should be given. If any uncertainty is felt as to the condition of the soil a test can easily be made by inserting a stake or iron rod in the soil and observing its condition when withdrawn. The stake or rod will show whether it has passed through wet or dry soils, especially if the loose, dry surface is just scraped away before inserting it into the soil. Yews and hollies, especially the latter, may be planted during this month. Any that have not been transplanted for a few years may now be removed with greater safety than at any other time of year, and the end of May is better than the beginning.—E. F. HAZELTON.

JUBILEE
of the
GRAND YORKSHIRE GALA,
YORK.
June 17th, 18th, and 19th, 1908.
PRIZES, £1,050.
Entries close June 1st.

FRED. AREY, Secretary,
Davyhall Chambers, York.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Auricula and Primula Society.

(MIDLAND SECTION.)

APRIL 29.

Typical flower show weather materially contributed to the success of the ninth annual exhibition of the Midland branch of this society, and afforded a striking contrast to the wretched weather that characterised the opening of the daffodil show a few days previously. This was the best attended show in the annals of the society. The exhibition was opened by Madame Moody Manners, from the Theatre Royal, Birmingham.

SHOW AURICULAS.

Considering the absence of the southern growers, excepting, however, the presence of Mr. James Douglas, of Great Bookham, and Mr. W. Smith, the Midlanders were to be congratulated on having secured such a signal success, so far as the average quality of the exhibits was concerned. Mr. J. Douglas led with a superb lot in the premier class for eight show auriculas, showing George Lightbody, Mikado, Abbé Liszt, Amy Robsart, Mrs. Henwood, Favourite, Charm, and Eucharis. The Rev. F. D. Horner brought a good second prize lot from Burton-in-Lonsdale, containing such as Mrs. Henwood, George Lightbody, Melaine, Shirley Hibberd, Favourite, Doctor Horner, Orpheus, and [illegible] Horner; third, Mr. W. M. Shipman; and fourth, Mr. W. Smith. In the class for six show auriculas Mr. Douglas repeated his lead with Mrs. Phillips, Greylag, Abbé Liszt, George Lightbody, Shirley Hibberd, and Richard Headley; Mr. C. Winn, Selly Oak (gardener, Mr. T. F. Shepperd), second, with Shirley Hibberd, Abbé Liszt, Favourite, Ruby, R. Headley, and Marmion; Rev. F. D. Horner, third. For four varieties, the first prize was annexed by Mr. W. H. Parton, Kingswood Grange, Hollywood, with superb examples of Acme, Mrs. Phillips, Shirley Hibberd, and Favourite; Mr. Thomas W. Eglington, Birchfields, second, with Cleopatra, Beauty, Gerald, and Mrs. Henwood. For two varieties Mr. G. D. Ford, Acock's Green, led with George Rudd and Gerald; Mr. G. D. Ludford, Four Oaks, second, with Acme and Shirley Hibberd. The class for single plants was also well represented.

MAIDEN AND LOCAL GROWERS.

For two plants, show auriculas, Mr. Ford was first among maiden exhibitors with two seedlings; Mr. H. W. Miller second with Acme and Cleopatra.

The local growers gave a very good account of themselves in the small classes for three show auriculas. Mr. C. Winn was to the fore with Shirley Hibberd, Mrs. Henwood, and Favourite. Mr. Ludford second with Letitia, Ruby, and Mrs. Henwood; Mr. Eglington third with very good examples.

ALPINE AURICULAS.

These formed a very interesting and attractive feature, and they strongly appeal to public admiration. The class for eight varieties was a capital one; Mr. James Douglas was the leader, his varieties being Mrs. James Douglas, Teviotdale, Argus, [illegible], Olivia, Phillis, Rover, and J. F. Kew; the second prize falling to Mr. C. Winn for excellent examples of Mrs. Danks, Firefly, Blue Bell, Thetis, Phito, General Buller, Argus, and J. F. Kew; a good third was Mr. Eglington.

For six varieties Mr. Douglas was again to the fore with Rosy Morn, Teviotdale, Flora McIvor, Lady of the Lake, Mrs. James Douglas, and Argus; Mr. C. Winn second with Firefly, Thetis, General Buller, Duke of York, Mrs. Danks, and Argus. For four varieties Mr. W. H. Parton scored with fine examples of Duke of York, Mrs. Martin Smith, Mrs. Gorton, and Thetis; a close second was Mr. Richard Holding (the secretary), with Acantha, Richard Dean, R. Holding, and Argus; Mr. Ludford came third in this keen contest. For two plants Mr. Parton again asserted his right with excellent examples of Mrs. Gorton and Thetis, followed by Mr. Ford with Duke of York and Teviotdale, a close third being Mr. H. Lawton, Aston.

In the class for a single variety with a golden centre Mr. R. Holding won with a variety named Unexpected, and possessing considerable promise; Mr C. Winn second with an unnamed, but very good variety. For a light centre Mr. Parton won with Thetis; Mr. Eglington second with Argus, and Mr. Ludford third with Thetis. For two alpines (maiden growers) Mr. S. E. Williams, Brierley Hill, was to the fore with Mr. W. Smith and Argus; Mr. H. Miller, Perry Barr, second, with Friendship and Thetis; Mr. Ford third with Dean Hole and a seedling.

In the class for three varieties, local growers, Mr. C. Winn won with Argus, Richard Dean, and Thetis; Mr. R. Hutching second with Golden Acme, Auriaila, and Prudence; Mr. E. Danks, Handsworth, third.

SEEDLINGS, ETC.

For two varieties of seedling show auriculas the Rev. F. D. Horner was first with Geraldine and Sunrise; Mr. W. Smith second, with Mr. Ludford third, both with unnamed varieties. For one plant, green-edge, Rev. F. D. Horner led with Orient; Mr. C. Winn second with Mrs. Shepperd; Mr. W. Smith third with an unnamed seedling. For a grey-edge Mr. W. Smith had Stately; Rev. F. D. Horner second with Greylag, and third with Vanguard. For a light-edged variety Mr. E. Danks secured the first prize with an unnamed seedling.

The society's silver spoon for the premier show auricula was won by Mr. James Douglas, with Harrison Weir. In the class for six fancy auriculas, dissimilar, Mr. Ludford annexed the first prize with Old Gold, Golden Plover, Isis, Queen Alexandra, Transformation, and an unnamed seedling; Mr. C. Winn second with Victoria, Old Gold, Libra, Rolt's Red, Buttercup, and an unnamed seedling.

POLYANTHUSES AND PRIMROSES.

As usual, prizes were offered for polyanthuses. It is much to be deplored that the good old-time gold-laced varieties should have come so near to extinction, considering also that they are not more difficult to cultivate than their relatives, nor has such a variety as George IV., for instance, deteriorated from its original condition. The sole exhibitor was the veteran grower, Mr. J. Stokes, of Harborne, and who was awarded the first and second prizes for a very good exhibit, each of George IV., and who also staged a plant of Miss R. Turner, less meritorious. It may be remarked that Mr. Stokes also exhibited in the auricula classes, and secured several minor prizes.

Prizes were offered for six pots of fancy polyanthuses or primroses, single or double. The only competitors were Miss Ludlow and Mr. T. Collier, who had fairly good examples, and were placed in the order named. For six pots of hardy primulas, distinct (first prize a gold-centre medal), Mr. Ludford was the only entrant, and was awarded the medal.

First Class Certificates were awarded to Mr. J. Douglas, for Orient and Harrison Weir auriculas; to Mr. C. Winn for Mrs. Sheppard; and to Mr. W. H. Parton for Jack Parton auriculas. A silver medal was awarded to Messrs. W. H. Simpson and Sons, Edgbaston, for a huge and effective bank of daffodils, arranged in masses, and a bronze medal was awarded to Mr. C. Winn for a nice group of Schizanthus Wisetonensis.

National Auricula Society.

NORTHERN SECTION.

MANCHESTER, MAY 2.

The thirty-fifth annual exhibition of this society was a very successful one, and clearly showed that there is no danger of auricula growing dying out in the North of England. Both exhibitors and plants were there in greater numbers than usual, and the exhibits were rather uncomfortably crowded in the space available at the Coal Exchange. The stage auriculas showed signs of the uncongenial spring, and most of the exhibitors would have staged better had the show been held a week later, still the classes were all well filled, and many good exhibits were not placed in the prize list. There were few novelties of note. Mr. Wilson, of Sheffield, had a good purple self seedling called Miss Violet, which was certificated; George Lightbody was well shown, green and white edges were not so good as usual, but selfs were numerous and good. Alpines were well shown, and there were many new varieties of great merit; a considerable number of the exhibitors are evidently raising seedlings and doing good work in producing good novelties. Some of the younger growers would do well to take more pains in staging their flowers, for judges cannot be expected to look for merits in flowers that modestly hang their heads in a retiring fashion. Polyanthuses were not quite so numerous as usual; there were, however, some good flowers shown, and George IV. worthily won the premier prize. Mr. Lord, as usual, had the premier auricula with Mrs. Henwood, Mr. Bentley the premier alpine with Miss Vernon, and the premier polyanthus with George IV.

SHOW AURICULAS.

In competition for the prizes for six distinct varieties the awards were as follows: 1, Mr. T. Lord, Todmorden, with G. Lightbody, A. Barker, Mrs. Potts, Acme, Ruby, and Mrs. Henwood; 2, Mr. W. H. Midgley, Halifax, with Ruby, Orient, Letitia, Mrs. Henwood, John Simonite, and G. Lightbody; 3, Mr. J. H. Wilson, Sheffield, with G. Lightbody, Favourite, Letitia, A. Barker, Cleopatra, and Traills Beauty; 4, Mr. W. M. Shipman, Altrincham; 5, Mr. A. Yates, Castleton; 6, Mr. J. E. Beaumont, Stalybridge; and 7, Mr. S. Etherington, Middleton Junction. For four dissimilar: 1, Mr. T. Lord, with Mrs. Henwood, G. Lightbody, Acme, and Mrs. Potts; 2, Mr. J. E. Beaumont, with Acme, G. Rudd, Shirley Hibberd, and Mrs. Potts; 3, Mr. F. Faulkner; 4, Mr. J. H. Wilson; 5, Mr. W. M. Shipman; 6, Mr. W. H. Midgley; and 7, Mr. A. Yates.

For pairs of auriculas: 1, Mr. J. W. Bentley, Middleton, with Shirley Hibberd and Ruby; 2, Mr. J. H. Abbott, Heaton Mersey, with Shirley Hibberd and Mrs. Potts; 3, Mr. S. B. Bolton, Warrington; 4, Mr. J. Stelfox, Stalybridge; 5, Mr. B. Simonite, Sheffield; and 6, Mr. G. D. A. Hall, Stockport. For maiden growers: 1, Mr. J. H. Abbott; 2, Mr. S. B. Bolton; 3, Mr. T. Sharpe, Kendal; and 4, Mr. James Antrobus, Wilmslow.

Single specimens were numerous, and of much merit. Green edge: 1, Mr. W. M. Shipman, with A. Barker; 2, Mr. T. Lord, with A. Barker; 3, Mr. J. W. Bentley, with Shirley Hibberd; and 4, Mr. T. Lord, with A. Barker. Grey edge: 1 and 2, Mr. T. Lord, with G. Lightbody; and 3 and 4, Mr. W. M. Shipman, with G. Lightbody. White edge: 1, Mr. T. Lord, with Acme; 2, Mr. A. Yates, with Acme; 3, Mr. W. M. Shipman, with Acme; and 4, Mr. W. H. Midgley, with Letitia. Self: 1, Mr. J. H. Wilson, with Miss Violet; 2, Mr. J. W. Bentley, with Midgley's Seedling; and 3 and 4, Mr. T. Lord, with Mrs. Potts.

In the class for three dissimilar (for growers not employing a gardener): 1, Mr. J. E. Beaumont, with Acme, Shirley Hibberd, and Mrs. Potts; 2, Mr. W. H. Midgley; 3, Mr. J. Stelfox; and 4, Mr. F. Faulkner. One seedling: 1, Mr. J. H. Wilson, with Miss Violet; 2, Mr. B. Simonite, with Ossian; and 3, Mr. W. H. Midgley. For four dissimilar, open to maiden growers in 1905, 1906, 1907, or 1908: 1, Mr. F. Faulkner, with G. Lightbody, Ruby, Letitia, and Shirley Hibberd; 2, Mr. James Antrobus; and 3, Mr. J. Fillingham, Manchester.

The premier show auricula was Mrs. Henwood, exhibited by Mr. Lord.

In the class for six dissimilar alpines, shaded, the successful exhibitors were: 1, Mr. J. W. Bentley with J. F. Kew, Captain Hunt, Vestal, Miss Vernon, Gentle Jackie, and D. Jackson; 2, Mr. T. Lord with Mrs. J. W. Bentley, Mrs. Lord, Gentle Jackie, Miss Baker, Mrs. M. Smith, and Mabel; 3, Mr. F. J. Dickens, Sam, Firefly, Pluto, Miss Baker, Lillie Dickens, and Quakeress; 4, Mr. G. Geggie (Sale); 5, Mr. W. M. Shipman; 6, Mr. J. Stelfox. For four distinct, 1, Mr. T. Lord with Pluto, Mrs. J. W. Bentley, Miss Baker, and Gentle Jackie; 2, Mr. F. J. Dickens with Oswald, Attraction, Rufus, and E. Phillips; 3, Mr. J. W. Bentley with J. B. Sams, Vestal, Claribel, and Lottit Slowboy; 4, Mr. W. M. Shipman; 5, Mr. J. E. Beaumont. For pairs, 1, Mr. S. B. Bolton with Firefly and Thetis; 2, Mr. Jas. Antrobus with Pluto and Duke of York; 3, Mr. G. D. A. Hall; 4, Mr. J. E. Beaumont; 5, Mr. T. Lomas, Stalybridge; 6, Mr. F. Faulkner. For maiden growers, 1, Mr. S. B. Bolton with Firefly and Thetis; 2, Mr. Jas. Antrobus; 3, Mr. J. Tonge, Altrincham. One, yellow centre, 1, Mr. G. Geggie with Joyce Atkinson; 2, Mr. J. Bentley with Dr. Kershaw; 3, Mr. T. Lord with Mrs. M. Smith; 4, Mr. S. B. Bolton; 5, Mr. T. Lord; 6, Mr. W. M. Shipman. One, white centre, 1, Mr. T. Lomas with Mrs. N. Turner; 2, Mr. T. Lord with Winifred; 3, Mr. J. W. Bentley with Cynthia; 4, Mr. W. M. Shipman; 5, Mr. G. Geggie; 6, Mr J. Edwards, Polackley. Three distinct, for growers not employing a gardener, 1, Mr. J. E. Beaumont; 2, Mr. G. Geggie; 3, Mr. F. Faulkner; 4, Mr. W. Stringer, Middleton.

The premier exhibition alpine was Miss Vernon shown by Mr. J. W. Bentley.

GOLD-LACED POLYANTHUSES.

The results in the class for three dissimilar, black ground, were as follows: 1, Mr. J. W. Bentley with Mrs. S. Holden, Exile, and Mrs. Brownhill; 2, Mr. J. Lomas, Seedley, with Coronation, Princess Ena, and Fred Morrey; 3, Mr. W. Stringer, with Tiny, Mrs. Holland, and Mrs. Brownhill. For three dissimilar, red ground, 1, Mr. J. W. Bentley with Sir S. Smith, George IV., and Middleton Favourite; 2. Mr. James Lomas with Red Den, Red King, and King Alphonso, 3, Mr. W. Stringer with Mrs. Brownhill, Mrs. Holden, and Sir S. Smith; 4, Mr. G. Geggie with Mrs. Holden, J. Turner, and George IV.

Single specimens, black ground, 1, Mr. J. Lomas with Mayfield Gem; 2, Mr. J. W. Bentley with Mrs. Brownhill; 3, Mr. J. W. Bentley with Exile; 4, Mr. J. Lomas; 5 and 6, Mr. J. Fillingham. Red ground, 1, Mrs. Helen Young, Chorlton-cum-Hardy, with King Alphonso; 2, Mr. J. W. Bentley with George IV.; 3, Mr. J. Lomas; 4, Mr. J. W. Bentley; 5, Mr. J. Lomas; 6, Mr. J. Fillingham.

For three dissimilar, for growers not employing a gardener, 1, Mr. J. Lomas with J. Burns, Mamie Scholes, and seedling; 2, Mr. W. Stringer; 3, Mrs. Helen Young; 4, Mr. S. Etherington.

The premier polyanthus in the exhibition was George IV., exhibited by Mr. J. W. Bentley.

Certificates were awarded to self auricula Miss Violet, shown by Mr. J. H. Wilson, to the undermentioned alpine auriculas: Miss Vernon, from Mr. J. W. Bentley; Sam, from Mrs. F. J. Dickens; Joyce Atkinson, from Mr. G. Geggie; and Ethel Faulkner, from Mr. F. Faulkner; and to show polyanthuses Mamie Scholes and Mayfield Gem, from Mr. J. Lomas.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, APRIL 28.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Dr. A. B. Rendle; Messrs. W. Cuthbertson, J. T. Bennett-Poë, J. W. Odell, H. J. Elwes, A. Worsley, W. Hales, and F. J. Chittenden (secretary).

DAFFODIL SEEDLINGS.—Rev. G. Engleheart, V.M.H., sent the following communication concerning the white seedling daffodils shown by him at the previous meeting. "During the past twenty years I have several times, in successive years, cross-fertilised Narcissus M. J. Berkeley ♀ on a considerable scale in order to obtain a race of early-coloured N. incomparabilis, and in this I have been successful. But in each set, when it reached the flowering stage, there have appeared some of these white trumpets, virtually M. J. Berkeley itself, except in colour. There has always been also a sprinkling of yellow trumpets, i.e., M. J. Berkeley itself, reproduced from seed of a few flowers which escaped being totally disanthered, and the whites, I am convinced, originated in the same way. I mean that they were not produced by pollen of any white trumpets being conveyed to M. J. Berkeley. For (1) no white trumpets were grown near, and few, if any, were in bloom so early as M. J. Berkeley; (2) early white trumpets, such as N. cernuus, invariably, in my large experience, modify the form of the ♀ parent, and (3) the appearance of flowers of this same character in every batch of seedlings points to a uniform internal cause in M. J. Berkeley itself. Not only the form of the flower, but the foliage, stature, whole habit, and precise period of bloom are M. J. Berkeley in counterpart.

"M. J. Berkeley was raised by Backhouse about 1840, and is pretty obviously a self-fertilised seedling from N. maximus, which in its turn is a wild species indigenous on the French side of the lowland Pyrenees. I have had bulbs direct from the wild habitat, and have been in correspondence with a good botanist who has seen the plants in bloom there, but I have never heard of any white wild variety of N. maximus. I have myself raised from self-fertilised seed of N. maximus a flower in the way of M. J. Berkeley, and that form has no appearance in any single feature of being the result of a cross with a white trumpet. Personally, I have no doubt whatever that this is a sudden 'spontaneous' break to white from yellow.

"The nearest analogy I can adduce is the occasional appearance of a pure white form in wild beds of the yellow Pyrenean N. muticus, quite reproductions, in every feature but colour, of muticus itself. No white trumpet exists in the same zone as N. muticus, the little wild white N. moschatus being thousands of feet higher in a remote valley.

"I have no reason whatever to suppose that there is any white hybrid blood in the ancestors of M. J. Berkeley, i.e., that these white seedlings exhibit a reversion to ancestral character. It seems more likely to be an instance of a sudden 'mutation' from yellow to white in colour progress. It is interesting to note that precisely the same thing has been noticed in New Zealand in seedlings of M. J. Berkeley."

SEEDLINGS OF GRETUM.—Mr. W. Hales showed seedlings of Gretum Gremon grown at the Chelsea Physic Garden, exhibiting the foot which absorbs the food stored in the seed for the nourishment of the growing seedling; this foot is developed only to a very slight degree in some other gymnosperms, such as ephedra.

DELAYED FLOWERING OF AMARYLLIS.—Mr. Odell showed some flower buds of Amaryllis belladonna which were now appearing. The flowering had been delayed in many cases in the autumn, apparently through the short suitable season. Mr. Baker states that the normal period of flowering was in April in the native habitat, but this statement was called in question.

FLORAL MALFORMATIONS. — Mr. Bowles showed, on behalf of Messrs. Hogg and Robertson, of Dublin, a malformed flower of Narcissus J. T Bennett-Poë. The parts of the perianth and the stamens were each nine, and springing from the base of the style was a narrow tubular growth embracing what appeared to be a secondary style. This flower, and a double-spathed caladium, L. A. Van Houtte, somewhat similar in structure to the double-spathed richardia shown at the last meeting, exhibited by Messrs. J. Veitch, of Chelsea, were referred to Mr. W. C. Worsdell for further examination.

PYRONIA JOHN SEDEN.—Messrs. J. Veitch and Sons showed fruits of one of the hybrids exhibited before the committee in the autumn. The fruits of this hybrid were quince-like in appearance, and had a remarkably pleasant aroma, but were still quite hard.

SNOWDROP BULBS.—Brodie of Brodie, Brodie Castle, Forres, sent two snowdrops with the new-formed bulbs produced at a distance of two inches above the original bulbs, with which they were connected by means of a tube formed by sheathing membranous leaves.

Norfolk and Norwich Spring Show.

This fixture was held at Norwich on Saturday, April 25. Thursday is early closing day, and the usual day for shows. But the hall was engaged, and it was unfortunate for the society. Then the elements were against one thinking of flower shows, and talks of snowfalls and sharp frosts seemed to predominate in one's ears. Still, taken generally, the show was very pretty, and quite up to its predecessors. What it lost in outdoor-grown subjects was ably made up by the display of indoor subjects. The orchids sent by Mr. Rider Haggard, Ditchingham, and those from Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham, were fine examples of cultural skill. The four circular groups of foliage and flowering plants were also worthy of special mention, the arrangement and blending of colours being tastefully carried out. In the softwood plants Mr. F. Williams, gardener to Louis Tillett, Esq., M.P., Catton, staged some of the best cinerarias ever seen at Norwich, and his six pots of strawberries were pictures of health, with a uniform crop of deep-coloured fruits. Mr. George Davison, Westwick Hall Gardens, secured all the best awards for narcissi, the strength of his flowers and fresh look upon them won him many complimentary remarks. Mr. L. Smith, gardener to Robert Fellowes, Esq., in spite of the adverse climatic conditions, made a pretty display of hardy flowers, which were a credit to him. One might go on specialising in this way for some time, but one word more, however, is due to the various trade firms, who by their exhibits, gave a greater interest. Messrs. Daniels Bros., Lim., Norwich, made a [illegible] display of flowering and foliage plants; Hobbies, Lim., Dereham, set up hosts of roses of the polyantha type, and other subjects. Mr. R. C. Notcutt, Ipswich, gave a display of forced flowering shrubs, and Mr. Dawes, of Syderstone, made a display of his new variety of rhubarb.

Bristol Gardeners' Association.

The tenth annual meeting held on Thursday, April 23, partook of a very hearty and enthusiastic character. Mr. J. C. House presided, and Mr. J. Scott, Downside Gardens, read a very encouraging report of the year's proceedings, followed by the [illegible] statement, which records a balance [illegible] for the first time in the society's existence. It is largely owing to the energetic [illegible] rendered by Mr Scott that the society is [illegible] in such a flourishing condition.

Lieut.-Colonel Carey-Batton, High [illegible] of Bristol, was re-elected president [illegible]mously; Mr. Shelton, Redland Lodge dens, and Mr. Shaddick were respectively elected chairman and vice-chairman for the ensuing session; Mr. J. C. House was thanked for so ably and efficiently carrying out the duties of the chair in the past session; Messrs. J. Scott and H. Woodward were re-elected as hon. secretary and treasurer and assistant secretary respectively. There is a bright prospect for the new session; five new members were elected.

Mr. Curtis was awarded first prize for three cool house orchids, and a certificate went to Mr. Shewring, gardener to Mr. Densham, for Cypripedium hirsutissimum.

NEW VARIETIES OF DAFFODILS.

The following were the leading new daffodils at Birmingham:

Buttercup (Dawson), received a first-class certificate. It is the fine deep yellow, jonquil-looking magni that gained an Award of Merit from the Royal Horticultural Society on April 14, and illustrated in the GARDENERS' MAGAZINE of April 18.

Chloe (T. Batson), which received an Award of Merit, is a typical giant Johnstoni with pale, soft colouring, and a flat, overlapping perianth. It is a decided acquisition to this type of flower.

White Wax (P. D. Williams), is an elegant medium-sized, pure white magni with great substance in its petals. It is a real florist's flower.

Pixie (Crosfield), was thought by many to be the flower of the whole show. I am quite sure its owner would not have changed it for any other. It has an Engleheartei crown, edged with red and with a green centre. The perianth is thick and fleshy.

Uncle Robert (Crosfield), an immense white trumpet, probably the largest we have.

Brilliancy (R. H., Bath), a large Barri conspicuus.

Milkmaid (P. D. Williams), a pure white drooping Leedsi.

Warrior (Currey), a large red-cupped Incomparabilis with a pale yellow perianth.

Mrs. C. M. Alderson (Spurrell), a nice flower of the Albatross type.

Furnace (Barr), the most fiery-red cup there is.

Tennyson (P. D. Williams), a grand Poet.

Satisfaction (Crosfield), a stiff giant bicolor incomparabilis.

The Rising Sun (Cartwright and Goodwin), a large Tenby, very good.

Penguin (Hogg and Robertson), a very beautiful giant Leedsi that invariably attracts me whenever I see it.

Coxswain (Pope and Sons), a white ajax with a beautifully twisted perianth.

JOSEPH JACOB.

TRADE NOTE.

Messrs. John K. King and Sons, Coggeshall, sent us, a few days ago, some specimens of their specially selected stock of Green Curled Kale. The curling and frilling of the leaves show the high-water mark of perfection in this curious, interesting, and extremely useful section of the cabbage family. The exquisite frilling is really beautiful, and when one attempts to smooth out a leaf the large amount of food material each one contains becomes evident. The pains that our seedsmen take to improve existing vegetables, and also the excellent results those pains ensure, are made evident in this fine stock of curled kale.

FORTHCOMING ENGAGEMENTS.

TUESDAY, May 12.—Royal Horticultural Society: Committee meet at 12 o'clock; lecture at 3 p.m. "On Gardening in the West Highlands," by Mr. Osgood H. Mackenzie; Scientific Committee at 4 o'clock.

WEDNESDAY, May 13.—Royal Society of Arts.

TUESDAY, May 19.—Croydon Gardeners' Society.

WEDNESDAY, May 20.—Royal Botanic Society's Exhibition.

Royal Society of Arts.

THURSDAY, May 21.—Brighton Horticultural Society Meeting.

ANSWERS TO CORRESPONDENTS.

ADDRESSES.—T. L. T., Loughborough: Messrs. James Veitch and Sons, Lim., Royal Exotic Nursery, King's Road, Chelsea; Messrs. Bees, Lim., Ness, Neston, Cheshire; and Messrs. T. S. Ware, Lim., Feltham, Middlesex.

CLIMBING ROSES.—M. E. J., Faversham: The weather has been too much for the newly-planted climbing roses, and the discoloured growths you send are quite dead. Your only plan is to cut the growths right back to sound live wood, and probably if you cut back to within six or eight inches of the ground the buds will start freely, and strong growths be made in the course of the season.

DAFFODIL BUDS.—E. W., Durham: As soon as the flower buds show signs of opening you may pick them, with long stems, and place them in clean water in a warm greenhouse, where they will soon expand, and thus open out quite clean and beautiful. Market growers pick the flowers as soon as the buds show colour, and open them under glass. You will notice that a daffodil is not quite at full size when it first expands; in a day or so afterwards the segments spread, all the wrinkles are smoothed out, and the flowers appear to be much larger than at first.

FORCED DAFFODILS.—J. C. C., Swindon: Place the pans and pots of bulbs close up to a sheltering hedge or fence, where they will receive full sunshine; give water as needed until the leaves begin to turn yellow, then withhold water, and eventually turn out the bulbs, and plant them as early as possible in the grass or shrubbery or woodland, as the case may be. After the leaves have died down take advantage of every opportunity for getting the bulbs planted, they will then be out of the way, and also be starting to make roots.

SHANTUNG CABBAGE.—W. E. A., Weybridge: The Chinese Cabbage, known variously as the Shangtung, Shangton, and Khantung Cabbage, is a variety of Brassica chinensis, and, in appearance, is something between a Cos lettuce and a strong Spinach beet. The Chinese name is Pe-tsai. The plant is an annual, and is best sown in late summer and early autumn, as there is a great danger of its running to seed if sown in spring or early summer; however, it would be well to sow at both seasons. Sow in drills from sixteen to twenty inches apart, and thin out the seedlings eventually to eighteen inches or two feet apart. The leaves are boiled and served as cabbage or kale, and the broad ribs may be cooked separately, and served like asparagus. You may possibly obtain seed through the several firms who advertise in our columns, but, if not, then apply to Messrs. Vilmorin-Andrieux and Co., Quai de la Megisserie, Paris. We have no remembrance of ever having tasted Shantung cabbage, but we are informed that it is of quite poor quality as compared with our own cabbages and kales.

FUMIGATION.—S. N. W., Cambridge: It is only in the hands of professional or long-experienced amateur gardeners that fumigation with rough tobacco and red-hot coke is safe, and even then the process is a most unpleasant one. Your better plan will be to use one of the nicotine compounds over a tiny spirit lamp; there is no need to stay in the house while this method of fumigation, or vapourising, is going on. A good syringing should be given fumigated plants, weather permitting, the following day.

PLANTING DAHLIAS.—F. F., Tamworth: Do not plant out the dahlias until the end of May or early June. If the plants have filled the pots with roots give them a shift at once, as the roots will have taken possession of the new soil before planting time comes. Obviously, only a small shift should be given. If the ground is not ready lose no time in preparing it, so that the soil may settle by the time you are ready to put out the plants.

SHELL FLOWER.—A. G. R., Islip: The great difficulty attending the use of popular names lies in the fact that the same name may be applied to several different plants, and, in different parts of the country the same plant may have different names. Several species of chelone, a genus closely allied to pentstemon, have been called shell flowers, but most probably the plant to which you refer as "a perfectly hardy annual, two feet high, and one of the most unique and interesting plants known to botanists," is Molucella lævis, a native of the Mediterranean region. The flowers are borne in little whorls; the labiate corolla is white, and the large, membranous, and veined calyx is somewhat shell-like in shape and appearance, and it persists for some time, forming a fine subject for skeletonising. If you grow the plant please send us flowering specimens at a later date, and we will do our best to name it for you.

GARDENER'S ILLNESS.—W., Yeovil: So far as we understand the case, the gardener, a domestic servant, living on the place, is entitled to his usual wages during illness, provided, of course, the illness is not caused by any foolish action on his part when away from business.

ROSA WICHURAIANA.—G. W., Harrow: According to the "Botanical Magazine," of June, 1895, the rose we have grown more or less familiar with as R. Wichuraiana should be labelled Rosa Luciæ, as the latter name was given to the species in 1871, whereas R. Wichuraiana was the name given by Crepin in 1876. The rose is a native of China and Japan, it is variable, and has a wide distribution. It is supposed to have been discovered by M. Callery, but the date of its introduction to cultivation is not certain. Plants were sent to Harvard University, from Berlin, in 1888, and from Harvard to Kew in 1891, but it must have been grown in England much earlier than this, as there is a specimen in the Kew Herbarium sent by Canon Ellacombe in 1880. With its lustrous leafage, abundant white flowers, and pleasing fragrance, and trailing habit, R. Wichuraiana is fine for clothing banks, and for rockwork, while as a parent, in association with garden varieties, it has given us a beautiful race of roses of graceful habit, fine for pillars or weeping standards, and Dorothy Perkins may be taken as one of the best, certainly the most popular, of that race. We may add that the name R. Luciæ was given in compliment to Madame Lucie Savatier, who actively aided her husband in his scientific exploration of Japan; in the recent "Handbook of Trees and Shrubs," published at Kew, however, the name of R. Luciæ is discounted, and R. Wichuraiana is the name adhered to.

Offices: 148 and 149, Aldersgate Street, London.

ROSE FLOWERS DAMPING.—T. V. Rodmersham: The flowers have suffered from excess of moisture in the atmosphere. Careless syringing may be partly answerable, but improper or insufficient ventilation is the chief cause of damping. Open the ventilators earlier, and gradually increase the ventilation as the weather permits.

NAMES OF PLANTS.

F. E. F., Southampton.—1, Hacquetia epipactis; 2, Primula frondosa.

W. B., Crawley.—The daffodil is Sir Watkin, and the orchid is Bifrenaria Harrisoniæ.

F. E. M., Horsham.—1, Orobus vernus; 2, Arabis aubrietioides; 3, Caltha palustris fl.-pl.

M. S. W., Motherwell. — Cœlogyne occellata; flower received safely, but answer overlooked.

M. C. H., Lowestoft.—1, Tulipa biflora; 2, Myosotis dissitiflora; 3, Fatsia (Aralia) japonica.

H. R., Nantwich.—1, Selaginella apoda; 2, S. Kraussiana aurea; 3, S. Emileana; 4, S. Galeotti.

L. H., Burton.—1, Prunus Pissardi; 2, Forsythia suspensa; 3, not recognised; 4, Thymus carnosus.

H., Malden.—Not sufficient for identification; send when in flower. No. 1 is, possibly, Achimenes (Gloxinia) tubiflora; and No. 2 an ageratum.

NEW BOOKS.

DAHLIAS AND THEIR CULTIVATION.

By J. B. Wroe. (London: (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 1s., by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d.

The various types of the dahlia, and especially the cactus and single-flowered sections, have become very popular for the decoration of gardens and for exhibition. The cactus dahlia, indeed, in its many rich and beautiful varieties, has proved itself indispensable for diffusing lustre and beauty in our gardens in autumn, and for yielding a harvest of charming flowers for cutting for the decoration of the home when the majority of other flowers have lost their attractiveness. Hence everyone owning or cultivating a garden in town, suburb, or country, should cultivate dahlias, and the author of the book before us has made it his business to supply the information needed in a clear and simple manner, teaching the proper method to pursue to not only grow the several types of the dahlia in the most successful manner for the decoration of the garden, but also how to cultivate them to the highest state of perfection in order to obtain honours in a close competition at an exhibition. He has told the reader how to propagate the dahlia by cuttings, seeds, and division of the tubers; when and how to plant; the best soil and position in which to grow the plants; how to train the shoots; manner of feeding to ensure a fine display of flowers; the pests that are likely to prove troublesome, and how to deal with them: and has given a careful selection of the best varieties for all purposes. We are just on the eve of the planting season, and it will well repay everyone who intends to plant dahlias to read the excellent advice given by Mr. Wroe on preparing the soil, planting in the most approved manner, and selecting the best and most beautiful varieties.

SITUATION COUPON

To the Advertisement Manager of "The Gardeners' Magazine,"
148 & 149, Aldersgate Street, London, E.C.

For MAY 16, 1908.

Please Repeat my Advertisement.

Name……………………………………

Address ……………………………………

……………………………………

Date……………………………

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

TO Noblemen and Gentlemen requiring HEAD GARDENER.—G. GRUBB offers himself as above; life experience in good gardens; highly recommended from present situation; disengaged when suited; married, age 32; at present general foreman at Somerhill Gardens, Tonbridge.

GROWER or as HEAD GARDENER.—A. WILLIAMS, for the last 7 years and 3 months Foreman Grower of Lane and Sons' famous Vines and Figs, is open to a Re-engagement, or Head Gardener where five or more are kept; of large and varied experience in all Horticultural matters. THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Flower Garden in Summer.

Strenuous efforts are now being made on all sides to complete the needful arrangements for beautifying the flower garden during the summer months; and within the next fortnight or so the beds and borders devoted to seasonal subjects will have received their summer occupants. Those who have acted upon the advice that has been given in these pages during the past few months will have their arrangements well advanced, and be in a position to give the finishing touches immediately the season is sufficiently advanced for the more tender subjects to be fully exposed to the weather. We have good cause for congratulation that the form of garden decoration popularly known as "carpet bedding" no longer has a place in private gardens, and that ribbon borders, with their long lines of gaudily-coloured flowers, have all but disappeared. We may rejoice also in the fact that hardy perennials are now so fully appreciated by flower lovers that a well-furnished "hardy herbaceous border" is generally regarded as an essential part of the flower garden. The finest of the large number of hardy perennials that are now in cultivation are so extremely beautiful, and rich in interest, that their value in contributing to the attractions of the garden cannot well be over-estimated. Some of their advocates, however, place too high an estimate upon their usefulness when they write and speak of them in such manner as to suggest their being grown to the exclusion of other plants for the embellishment of the flower garden and pleasure grounds. If there are any of our readers who prefer hardy perennials to all other ornamental plants that can be successfully used in furnishing beds and borders for the summer display, we would not suggest they should modify their views in the slightest degree. Moreover, we regard hardy perennials with so much favour, as evidenced by the attention given to them in our pages, that we strongly advise those who have but little, if any, glass, to confine their attention chiefly, if not wholly, to them. Having thus made our position quite clear with regard to hardy plants, we can, without any fear of being misunderstood, proceed to point out that a flower garden can, during the summer season, be made more interesting and attractive by the judicious association of both hardy and half-hardy plants. Speaking generally, hardy herbaceous plants are not so suitable as could be desired for the furnishing of beds occupying prominent positions on the lawn, or forming part of geometric schemes. The habit of some of the more beautiful kinds is not such as to render them specially suitable for beds, and but few have a long season of flowering. A comparatively short period of flower production is not of any great consequence when the plants are grown in mixed borders, because of the difference in the time of flowering of the several kinds, and the consequent succession of bloom. In beds the case is different, and the best course is to furnish them each year with two distinct sets of plants. In the autumn they will be planted with bulbs and other hardy plants for the production of a display of colour in the spring, and during the summer months they may be occupied with half-hardy plants remarkable for the beauty of their flowers or foliage, in mixture, or in masses of separate kinds. But unless the beds are quite small, tasteful combinations are preferable. We need not particularise, but with such subjects as the strong-growing calceolarias, fuchsias, heliotropiums, ivy-leaf pelargoniums, etc., in association with fine-foliaged plants of free habit, it will be possible in large beds to produce the most charming effects, while small beds might be wholly devoted to begonias, ivy-leaf pelargoniums, violas, and other plants of medium growth that bloom continuously throughout the season. In positions where subjects of bolder growth would be preferable the dwarf cannas might be utilised in the furnishing of small beds. It is not desirable all the beds should be devoted to temporary occupants, for some part of those on the lawn should certainly be furnished with tea-scented and hybrid tea roses. No hardy subjects will bloom more continuously or produce a more charming effect than these, provided they are placed under conditions favourable to their full development. As yet these two sections of roses have not been utilised for garden decoration in accordance with their merits, and we would urge their being planted more largely, especially by amateurs, who have, comparatively speaking, but little time to devote to their gardens. There are three points to be considered in growing roses in beds specially for garden ornamentation; the first is to select varieties that are free and continuous in flowering, to plant but one

DUKE OF BEDFORD, K.G.,
President of the Royal Gardeners' Orphan Fund.

variety in each bed, or, if more than one, to have varieties that differ but little in habit, and harmonise in colour, and to provide a deep rich soil. Violas of dwarf growth may be associated with the roses, as so successfully done at Hopetoun House and in many other good gardens. There is yet another point in the beautifying of the flower garden in summer that must have brief reference, and that is the representation of annual flowers. The most beautiful of these consort admirably with hardy herbaceous plants, and if the borders are not unduly crowded a selection of them may be grown without injury to the perennials. The annuals will not so impoverish the soil that the plant food cannot be readily replenished, and they will add greatly to the attractions of the borders, more especially towards the close of the summer when the permanent occupants have lost much of their charm.

The Duke of Bedford, K.G., has contributed so liberally to the furtherance of the science and practice of hardy fruit culture, and has been so generous in his support of the orphans of gardeners, that it gives us great pleasure in presenting our readers with his portrait in this issue. Appreciating the importance of giving the tenants on his large estates such guidance as would assist them to cultivate their holdings in the most profitable manner, and recognising the possibilities of hardy fruit growing for commercial purposes, he set apart, fourteen or fifteen years ago, a considerable area on his Woburn estate for the purpose of experimental fruit culture. This farm, of which Mr. Spencer Pickering, F.R.S., is the director was well arranged and admirably equipped, and since its formation an immense amount of experimental work of great value in its bearing on fruit culture has been accomplished. The object lessons the farm has been able to give can hardly have failed to prove most useful to the tenants on the estate, and indeed to all who have had an opportunity of visiting it and making observations on the experiments in progress. The annual reports edited by the Duke of Bedford and Mr. Pickering have been of much value, more especially the one issued at the beginning of this year which dealt chiefly with spraying and fruit tree washes. On the death of Sir Julian Goldsmid, Bart., who was the first president of the Royal Gardeners' Orphan Fund, the Duke of Bedford was elected as his successor, and throughout the period he has presided over the charity he has taken a keen interest in its affairs. The Duke of Bedford has now presided twice at the annual festivals of the fund, and on each occasion gave a strong proof of his sympathy with the objects of the charity, in whose interest we would express the hope that he may long continue to occupy the position of its president.

Foreign Fruits were plentiful in British markets during April, and the value of the imports was considerably in excess of that of the corresponding month of last year. The imports of apples were very large, as in the earlier months of the year, the total having having been 261,976 cwt., of the value of £182,040, or an increase in quantity of 83,798 cwt., and in value £39,783. Apricots and peaches do not make a very large showing in the month's returns, as only 1 cwt., of the value of £2, was imported. Banana imports dropped from 618,482 bunches, of the value of £176,710, in April, 1907, to 475,735 bunches, of the value of £132,785, last month. Of gooseberries the imports were 2 cwt., of the value of £10, the first time these fruits have been received from abroad so early in the year. Of lemons and oranges there were largely increased supplies, but in the imports of nuts there was a small decrease. The imports of grapes were largely in excess of those of the corresponding month of last year, the aggregate being 5,536 cwt., of the value of £21,192, as compared with 1,676 cwt., of the value of £7,345. In the pear imports there was an increase of 66 cwt., of the value of £148, the total having been 1,866 cwt., of the value of £3,337. Plums, on the other hand, show a relatively large decrease, the total having been 8 cwt., of the value of £8. Strawberries were imported to the value of £8, but the quantity is not given, and the value of unenumerated fruits was £5,082. The total value of the fruit imports was £798,460, or an increase of £26,548.

Recently Introduced Plants at Ghent.—We have much pleasure in acknowledging the list, which M. Maurice L. de Vilmorin has kindly sent us, of the large collection of recently introduced plants that he exhibited at the Ghent show. The list is of much interest, as indicating the large numbers of hardy trees and shrubs that have been introduced to Europe from Western China and elsewhere within recent years. The trees and shrubs include such promising subjects as Actinidia chinensis, Ailantus Vilmoriniana, Ampelopsis cantoniensis, Berberis sanguinea, Carpinus polyneura, Cormus foliolosa, Corylus thibetica, Cotoneaster angustifolia—an elegant species, producing a profusion of scarlet berries, of which we have given an illustration in these pages. Deutzia Vilmorinæ, Ligustrum Delavayana, Paulownia imperialis alba, Philadelphus Magdalenæ, Rosa sericea pteracantha, and Rubus lasiostylus. Unfortunately, the date of the exhibition was too early in the year for hardy trees and shrubs to be shown at their best, but the collection was of much interest, and the members of the jury showed their appreciation of the exhibit by awarding M. Vilmorin a gold medal.

Royal Gardens, Windsor.—The King has graciously consented to allow the members of the standing committees of the Royal Horticultural Society to visit the Royal Gardens at Frogmore. Wednesday, June 10, is the date arranged, though, should the Court be at Windsor at that time (which is unlikely) the day will be altered. The party will leave London at 12.5 noon; and on reaching Windsor, will be entertained at luncheon by the Mayor in the Guildhall. After lunch the gardens at Frogmore will be visited, and the party will return to town, reaching Paddington about 6.30 p.m.

Foreign Asparagus has been very plentiful in the London markets during the past ten days, and the prices of even finest produce has been very low. The supplies from France and Spain have been exceptionally large, owing to the stimulative effect of the high temperature that was experienced over Europe at the commencement of the month.

Vegetable Imports were in April last much larger than in the corresponding month of last year, both potatoes and onions having been received in increased quantities. The imports of potatoes were 997,392 cwt., of the value of £256,383, an increase in quantity of 549,489 cwt., and in value of £129,739. Of the aggregate, Germany sent 204,576 cwt.; France, 284,892 cwt.; Channel Islands, 4,461 cwt., and other countries, 503,463 cwt. Onion imports were 747,959 bushels, of the value of £97,054, or an increase of £151,352 bushels, of the value of £23,308. Tomatoes, on the other hand, show a decrease of 34,140 cwt., of the value of £34,609, the total having been 74,917 cwt., of the value of £59,196. Unenumerated vegetables dropped in value from £57,876 in April, 1907, to £46,355 last month.

Birmingham Flower Shows.—The Birmingham Botanical and Horticultural Society have decided to hold, as in 1906 and 1907, two extra flower shows. The first of these will be held on June 11, and will be devoted chiefly to orchids and early summer flowers, and the second will be held on July 15, and will comprise roses and midsummer flowers. The shows will be held at the Botanical Gardens, Edgbaston, and schedules may be obtained from the honorary secretaries.

Big Prizes for Apples.—Cultivators of apples should make note of the fact that in December next a National Apple Show will be held at Spokane, Washington State, America. As growers of apples in Canada and Europe are invited to compete for the liberal prizes offered, it would be more correct to describe the exhibition as international, but this is a small matter. The sum allocated for prizes is, we are informed, £3,000, and of this amount £200 will be given for the best apple. The object of this exhibition is, it is stated, to "popularise the apple as the great national fruit" of America. Washington State is remarkable for the extent to which apples are cultivated within its boundaries and also for the high state of development to which these fruits attain. Last year there were nearly 3,000,000 of apple trees in full bearing, and the value of the crop was estimated at £2,000,000. This year about 500,000 trees will come into bearing, and probably double that number of trees has been planted during the past planting season. There will thus be two national horticultural exhibitions in America this year, one at Chicago in November, and the Spokane apple show in the month following.

New American Rose Wyndmoor. A new rose that is regarded as an improvement on Killarney, and of a darker pink than that variety, has been raised in America by crossing American Beauty with Safrano. The variety won the American Rose Society's silver cup recently, and it is expected to prove as useful an outdoor rose as it is an indoor one.

Franco-British Exhibition. Mr. C. I. Kiralfy informs us that, owing to the arrangements it has been necessary to make in connection with the opening of the exhibition and the visit of the King and the President of the French Republic, the flower show fixed for May 19 and 20 will not be held.

Seed Inoculation. A bulletin has been issued by the Ontario Department of Agriculture giving the results of seed inoculation with bacteria obtained by Canadian farmers in 1906 and 1907. A total of 170 reports were received, and of these 72 described the inoculation of the seed with legume bacteria as beneficial to the crop, and in 42 reports it was stated that no benefit was apparent. The form in which the cultures are distributed has an important bearing upon the utility or otherwise of inoculation, and it is therefore unfortunate that the bulletin gives no information with reference to this point.

Diseased Broad Beans.—During 1907 two injuries to broad beans were investigated by the consulting botanist of the Royal Agricultural Society, and, according to his report, the leaves in one case were covered with numerous small orange-coloured pustules, being the fruiting stage of Uromyces fabæ Pers. No serious damage results from the attack of this fungus. The other case was an injury to the stems of beans from a field in Norfolk. The attack had begun in the root and passed up into the stem, suggesting the disease of blackleg in the potato plant. The parts killed in both the root and stem were filled with a greyish slimy substance swarming with innumerable very minute rod-like bacteria. The bacterium was isolated and cultivated on sterilised carrot. It grew freely, forming gelatinous, dirty white colonies. From these the bacteria were transferred on a needle to young seedling beans. The bacteria began to multiply, and in four days the blackness of the rootlets and the stem as in the original specimens made its appearance. The examination of the blackened tissues showed that the injury was due to the same bacteria. A further experiment was made to test whether this bacterium of the bean was the same as that causing blackleg in potato. Bacteria from the beans were transferred to healthy potato tubers which were planted in the soil. The shoots that were developed were healthy, but after direct infection of the shoots the disease appeared and they were killed. These results may not be sufficient to determine the identity of the bacterium causing blackleg in potatoes and in beans, it nevertheless establishes that the potato may be infected by the bacterium from the bean. It is, therefore, well that caution be exercised when an attack of blackleg appears in a crop of either beans or potatoes, neither plant should be the succeeding crop.

Calcium cyanamide.—With a view to test the relative merits of this new nitrogenous fertiliser as compare with nitrate of soda and sulphate of ammonia, a trial was last year conducted on the farm of the Royal Agricultural College, Cirencester. The Calcium cyanamide was used in the cultivation of both cereals and turnips, and it is reported that finer crops were obtained from the plots to which it had been applied than from those which had received equivalent applications of nitrate of soda and sulphate of ammonia.

Potato-disease Fungi. — Mr. Massee contributed to a recent meeting of the R.H.S. Scientific Committee specimens of potato tubers affected with "winter rot," with the fungus Nectria solani, which is the cause of the disease, growing thereon, remarking that it had been particularly prevalent during the past season, a fact that he attributed partly to the prevalence of rain during the last summer, and the difficulty of thoroughly drying the tubers before they were stored. This fungus had recently, he said, been described under another name by an investigator, a condition of things found not alone in this disease, for recently the fungus long ago described by Berkeley (see Journ. Roy. Hort. Soc., Vol. I., 1846, p. 33, Figs. 30, 31) under the name of Tubercinia scabies, and now known as Sorosporium scabies, Fisch., one of the causes of potato scab, had been apparently rediscovered and renamed as new, Spongospora solani on the Continent, and this name had been taken up by some botanists in England and Ireland as the newly-discovered cause of potato scab.

COLOUR CHART FOR SWEET PEAS.

An open letter to the Hon. Secretary of the National Sweet Pea Society:

Among the interminable discussions which take place in the world of sweet peas with respect to the truth, or otherwise, of varieties, nothing stands out more sharply than the difficulty in which the disputants find themselves when they wish to name, or describe, a colour.

Now this is not difficult to understand when it is remembered how many and various are the conditions necessary to the true judgment of colour.

Setting aside for the moment the question of colour-blindness (which is much more common than is generally supposed), the colour of an object depends on the light it sends back to the eye of the observer, and as much of this light must be reflected, it further follows that the colour is greatly dominated by the nature of the light in which it is seen. Moreover, the colour is very greatly affected by other colours placed in juxtaposition, either harmonising or contrasting. Again, the eye, when fatigued, or whenever any given colour has been under observation for some time, loses much of its normal nicety of judgment.

Partial colour blindness is present in only about 4 per cent. of the male population of these islands, but without doubt, some slight degree of this defect is much commoner. Now it is a significant parallel that the most commonly confused colour is red, and that the greatest controversies amongst sweet pea growers are those which relate to the pink and scarlet sections.

Now if these premises be granted—and I believe them to be incontestable, is it not a pity that there exists no standard by which these colours may be judged—a scientific standard erected by competent and recognised judges, which would enable the tyro and the expert alike to accurately describe the colours of his blooms—in other words, a standard colour chart, produced under the authority of the National Sweet Pea Society?

Various and many have been the objections raised to the proposal that the society should take this course, and all are more or less based on its admitted difficulty.

But a great society like the N.S.P.S. is destined to become—and even now, is—should not be turned from so eminently desirable a project on the mere score of the many obstacles to be surmounted—rather should it concentrate all its energies and overcome them—and it may further be urged that in dealing with the question of colour in a firm and unbiassed manner, the society is in reality, only forestalling and dispersing the grave danger of the over-multiplication of varieties that are no varieties, and the consequent reaction to disgust on the part of all growers, amateur and professional alike.

To deal first with the question of colour names, the difficulty of agreement on them would be met and solved by the very fact that this chart would be the standard of the sweet pea world: or, if you like, it would be evaded by the very easy plan of numbering the shades of colour in lieu of naming them, a course which would render agreement on the nomenclature unnecessary, and thus avoid clashing with preconceived ideas.

The fact of other charts differing in any respect would in nowise affect the issue—is not, in fact relevant; this and no other would be the Court of Appeal in the matter of sweet peas.

It has been urged that to issue such a chart under authority would necessitate altering the description of practically every florist's flower given in catalogues. The answer to that, to my mind, is that the project deals with sweet peas alone, and that any such alteration as that foreshadowed, although it would certainly be paying a high compliment to the society, would be totally unnecessary.

It has also been said that a sister society cannot agree over its highly elaborate French chart—yet it is admittedly easier to match colours than to name them offhand, and the said society certainly agrees on its colours eventually. It may be freely admitted that many existing charts are worse than useless, but it may be fairly said that no colour chart has yet been issued with quite our idea in mind.

Such a chart should have special characteristics.

In the first place, each shade should be not less than three square inches in dimension, so that a good-sized bloom might be laid thereon for comparison. Then, no more than the various shades of any one given colour should appear on a page, for the reason of alteration by contrast or harmony referred to above. Again, the surface of the paper employed should be matt, and the colour of the purity and lack of shine best produced perhaps by washes of water colour on "Whatman's hand-wove" paper. As before said, the shades should be numbered, and not named, though an index giving names might be added if desired. It would also be useful to illustrate the differing forms of the flower and name them, as there is occasional confusion displayed in this respect—this though is not germane to my subject.

In addition, the society might adopt some standard method to be followed when assaying colour, as some experts will take a single bloom and analyse it—others bunch a few in the hand, shading them from direct light—others again put a bunch into a vase and judge by the massed effect.

To conclude, there is no doubt that the production of such a chart would be a long and arduous undertaking, but I venture to say that the resulting gain would be great, out of all proportion to the effort we are called upon to make.

I therefore beg to offer a formal proposal that a small committee be appointed to deal with the matter, and that a special fund be opened and placed at its disposal.

To this latter I do myself the honour of offering the first guinea, and remain, dear Mr. Curtis.

Yours very sincerely,
Stanley Brook.

18, St. George's Place,
York.

Brentford, May 9, 1908.

The question of a colour chart for sweet peas has been discussed at some length in committee by our society, but no decision has yet been arrived at. Ways and means appear to be the chief stumbling-block, because it would be of little use if the N.S.P.S. brought out a colour chart at a price beyond the reach of many of its members. The "Repertoire des Couleurs" is a fine colour chart, but the price is prohibitive. To be effective the colour chart must be cheap enough for every flower lover to purchase, so that when a flower is described by its raiser or introducer, or in the records of the society, according to the chart, everyone would be able to turn to his or her colour chart and at once understand what colour the description indicated.

Personally, much as I would like the National Sweet Pea Society to have the honour of bringing out such a colour chart, I am afraid the cost of production would be too great for us to undertake, even with kindly help from friends as interested as Mr. Stanley Brook. But is not a colour chart rather the work of a combination of the floricultural societies? What a splendid thing it would be if for, say, 5s., we could have a colour chart that was at once the colour law for the Rose, Dahlia, Carnation, Chrysanthemum, Sweet Pea, and other National Societies. If the matter is beyond such a combination, then, might not our splendid Royal Horticultural Society produce such a chart at a moderate price? Surely it might, and we should then have a colour chart for all our floral descriptions.

Charles H. Curtis,
Hon. Sec., National Sweet Pea Society.

SIMPLICITY IN THE GARDEN

> "One looked all rose tree, and another wore
> A close-set robe of jasmine sown with stars;
> This had a rosy sea of gillyflowers
> About it; this a milky way on earth
> Like visions in the Northern dreamer's
> heavens,
> A lily avenue climbing to the doors;
> One, almost to the martin-haunted eaves,
> A summer burial deep in hollyhocks;
> Each its own charm."
>
> —Tennyson.

If one were asked to say what was the most strongly-marked characteristic of the gardens of the present day, one could scarcely do better than describe it as a return to Nature. We see it in the ever-increasing number of climbing and decorative roses of various types; in the modern taste for the single forms of some flowers as well as, or in some cases, instead of, the double forms, as in the rose and the chrysanthemum; and, above all, in the number of hardy wild plants of other countries which have been introduced into our gardens, either in their original state or in an improved form, of which the American prairie flower—Helianthus rigidus—and its many varieties, offer a striking instance, these and similar plants now occupying much of the space which was formerly devoted to summer bedding plants of a temporary character, which never looked, and never could look, as if they had become naturalised where we saw them growing.

It is not only in the character of the plants we grow, but in the way we grow them, that such a change is noticeable, a change almost as great as that which has taken place in the arrangement of cut flowers in the house. The tendency seems to be, in short, to get effects as nearly as possible like those which would be produced if the flowers were growing in a state of nature. Hence one seldom sees the ribbon border and the carpet bed outside the most formal of gardens; nor outside the gardens of inexperienced amateurs, or the cat-ridden suburban plots, to which Mr. Rider Haggard so often refers, do we see startling colour effects, gardeners, both amateur and professional, studying natural combinations of colour masses to good effect.

Though we often speak of a return to Nature—and apology should be made for the second use of so hackneyed an expression—we do not, perhaps, at the same time always think of the things we see in it, which it is possible for us to imitate to some extent in our gardens. We never see straight rows of hyacinths or tulips in a setting of bare earth, or roses growing on a small mop-like tree, or numbers of plants on a rockery with a wooden label stuck to each. What we do see is roses growing with the utmost freedom, forming perfect showers of blossom, and the ground everywhere well covered, so that bare earth is not usually visible, for, even in dense woods, it is covered with a carpet of leaves, while in the home of alpines and rock plants, though there is necessarily often a deal of bare rock, there are usually large patches of the same thing; Nature producing the same effect by massing together the small flowers of rock plants, namely, a display.

Above all, we see that Nature produces her most beautiful and striking effects with very simple materials, as with a hedge of blackthorn or may, or, late in the summer, with honeysuckle and travellers' joy growing over the same, while a meadow covered with buttercups, cowslips, or marguerites, or "a field of charlock in the summer sun" is one of the most beautiful sights one can see, and yet it is produced by the aid of one or two things only at the same time and in the same place. Art lovers will recall McWhirter's picture, "June in the Austrian Tyrol" in the Tate Gallery. It is true we enjoy the heterogeneous collection of flowers in an Alpine meadow, and to a less extent, in an English meadow, but, beautiful though they are, their beauty is chiefly owing to their remarkable luxuriance and the all-pervading rich grass as a setting for them all, so that it blends into one harmonious whole; but they do not produce that striking effect and command that voluntary admiration as is the case with the simple pictures referred to.

It is here that we have the visual illustrations of one of the great principles which should never be absent from our minds in all our garden plans and alterations. We do not, of course, want to limit ourselves to two or three things in flower at the same time, but our gardens will lose in effectiveness—however interesting they may be to their owners—if they become simply botanical collections. We have all seen collections of alpines and rock plants staged at the flower shows—small plants puddled into holes or cup-like depressions in pieces of concrete, each with a wooden label attached, setting out its generic and specific name, and I have seen actual rock gardens not much more natural in appearance, however interesting they may be, and there is no doubt they are that even to a chance visitor, if he knows anything at all about alpines; still they are not objects of beauty, and never will be until most of the plants die and the few remaining ones grow all over the place.

Therefore, to produce the best effect, we have to make a compromise, by which, however tempting it may be to try and grow a large number of things, most of them indifferently, we confine ourselves to a relatively small number, and, by keeping all plants of the same kinds together, produce some amount of display with each, and thus a succession of more or less striking pictures at different seasons of the year. We often see favourite plants dotted about from end to end of a mixed border, and in various other parts of the garden, producing no good effect, whereas if they were all together the effect might be very good. It resembles the difference of effect produced by the black and white threads in a piece of cloth being mixed together, producing a pepper and salt effect, and the same threads collected together into bands of black and white. This illustration, however, must not be pushed too far, and it is an unfortunate one if it gives the idea that violent contrasts are recommended. To quote from the advertisement to "Nature's Own Gardens": "The true value of any garden, whether constructed on the plan of the wild garden or that of the distinctly artificial and formal garden, always lies in the power for giving pleasurable and reposeful sensations in the manner of its arrangement, both as to colour-contrast, colour-massing, and in the grouping of plants in the right situations."

To give these "pleasurable and reposeful sensations," we should endeavour, as far as possible, to have harmony of colours rather than violent contrasts, and next to simplicity in the arrangement and number of flowers, this is the most important consideration in planting, and if one has not the artist's eye for colour, many mistakes will be made even with the best of intention before one has studied the effect of the juxtaposition of different colours in the garden for a long time. There are few who will not have felt that scarlets and purples do not mix well together, or that lilac and red or pink do not produce a pleasing effect upon the observer, whereas a pale yellow is a most useful and satisfactory go-between, preparing the eye for the transition from reds to purples, or from blues to mauves. This is a subject which one may study all one's life, one's eye becoming better and better trained in the appreciation or otherwise of different combinations of colours, until "that inner eye which is the bliss of solitude" will tell us, even at the first thought of a certain arrangement, whether it will be good in its effect or not. Perhaps it may be said that this study of the arrangement and combination of different colours in the garden is not simplicity, but smplicity does not imply the want of cultivated taste, and, even if only two flowers are grown near each other, the colours either go well together or the reverse, though it should be said in conclusion that there is a Tom Tiddler's ground, or debatable land, where experts may meet and strive for victory.

ALGER PETTS.

THE HIMALAYAN BRIAR, ROSA MOSCHATA.

The spirit which pervades all ranks of rose-lovers, seeking in every rose—whether it be a wild species or garden hybrid—for some merits worthy of admiration, has long since accorded to the Himalayan briar (Rosa moschata) a foremost place amongst wild roses.

It is no stranger to English gardens, having been introduced some 300 years ago from India, though it is occasionally found wild in Southern Europe. The aspect of this rose is formidable, and when growing freely it sends out stout shoots in one season some 10 to 15 feet long; these are closely covered by strong curved spines which makes it one of the most difficult roses to disentangle.

The flowers are single, borne in large bunches the full length of the shoots; the colour is soft creamy-white, with a boss of yellow stamens in the centre. They appear in July, and are at their best about the end of the month and beginning of August. The leaves are uniform grey-green, a colour not common among roses, but one which harmonises effectively with the flowers, and is a distinct change at all others seasons.

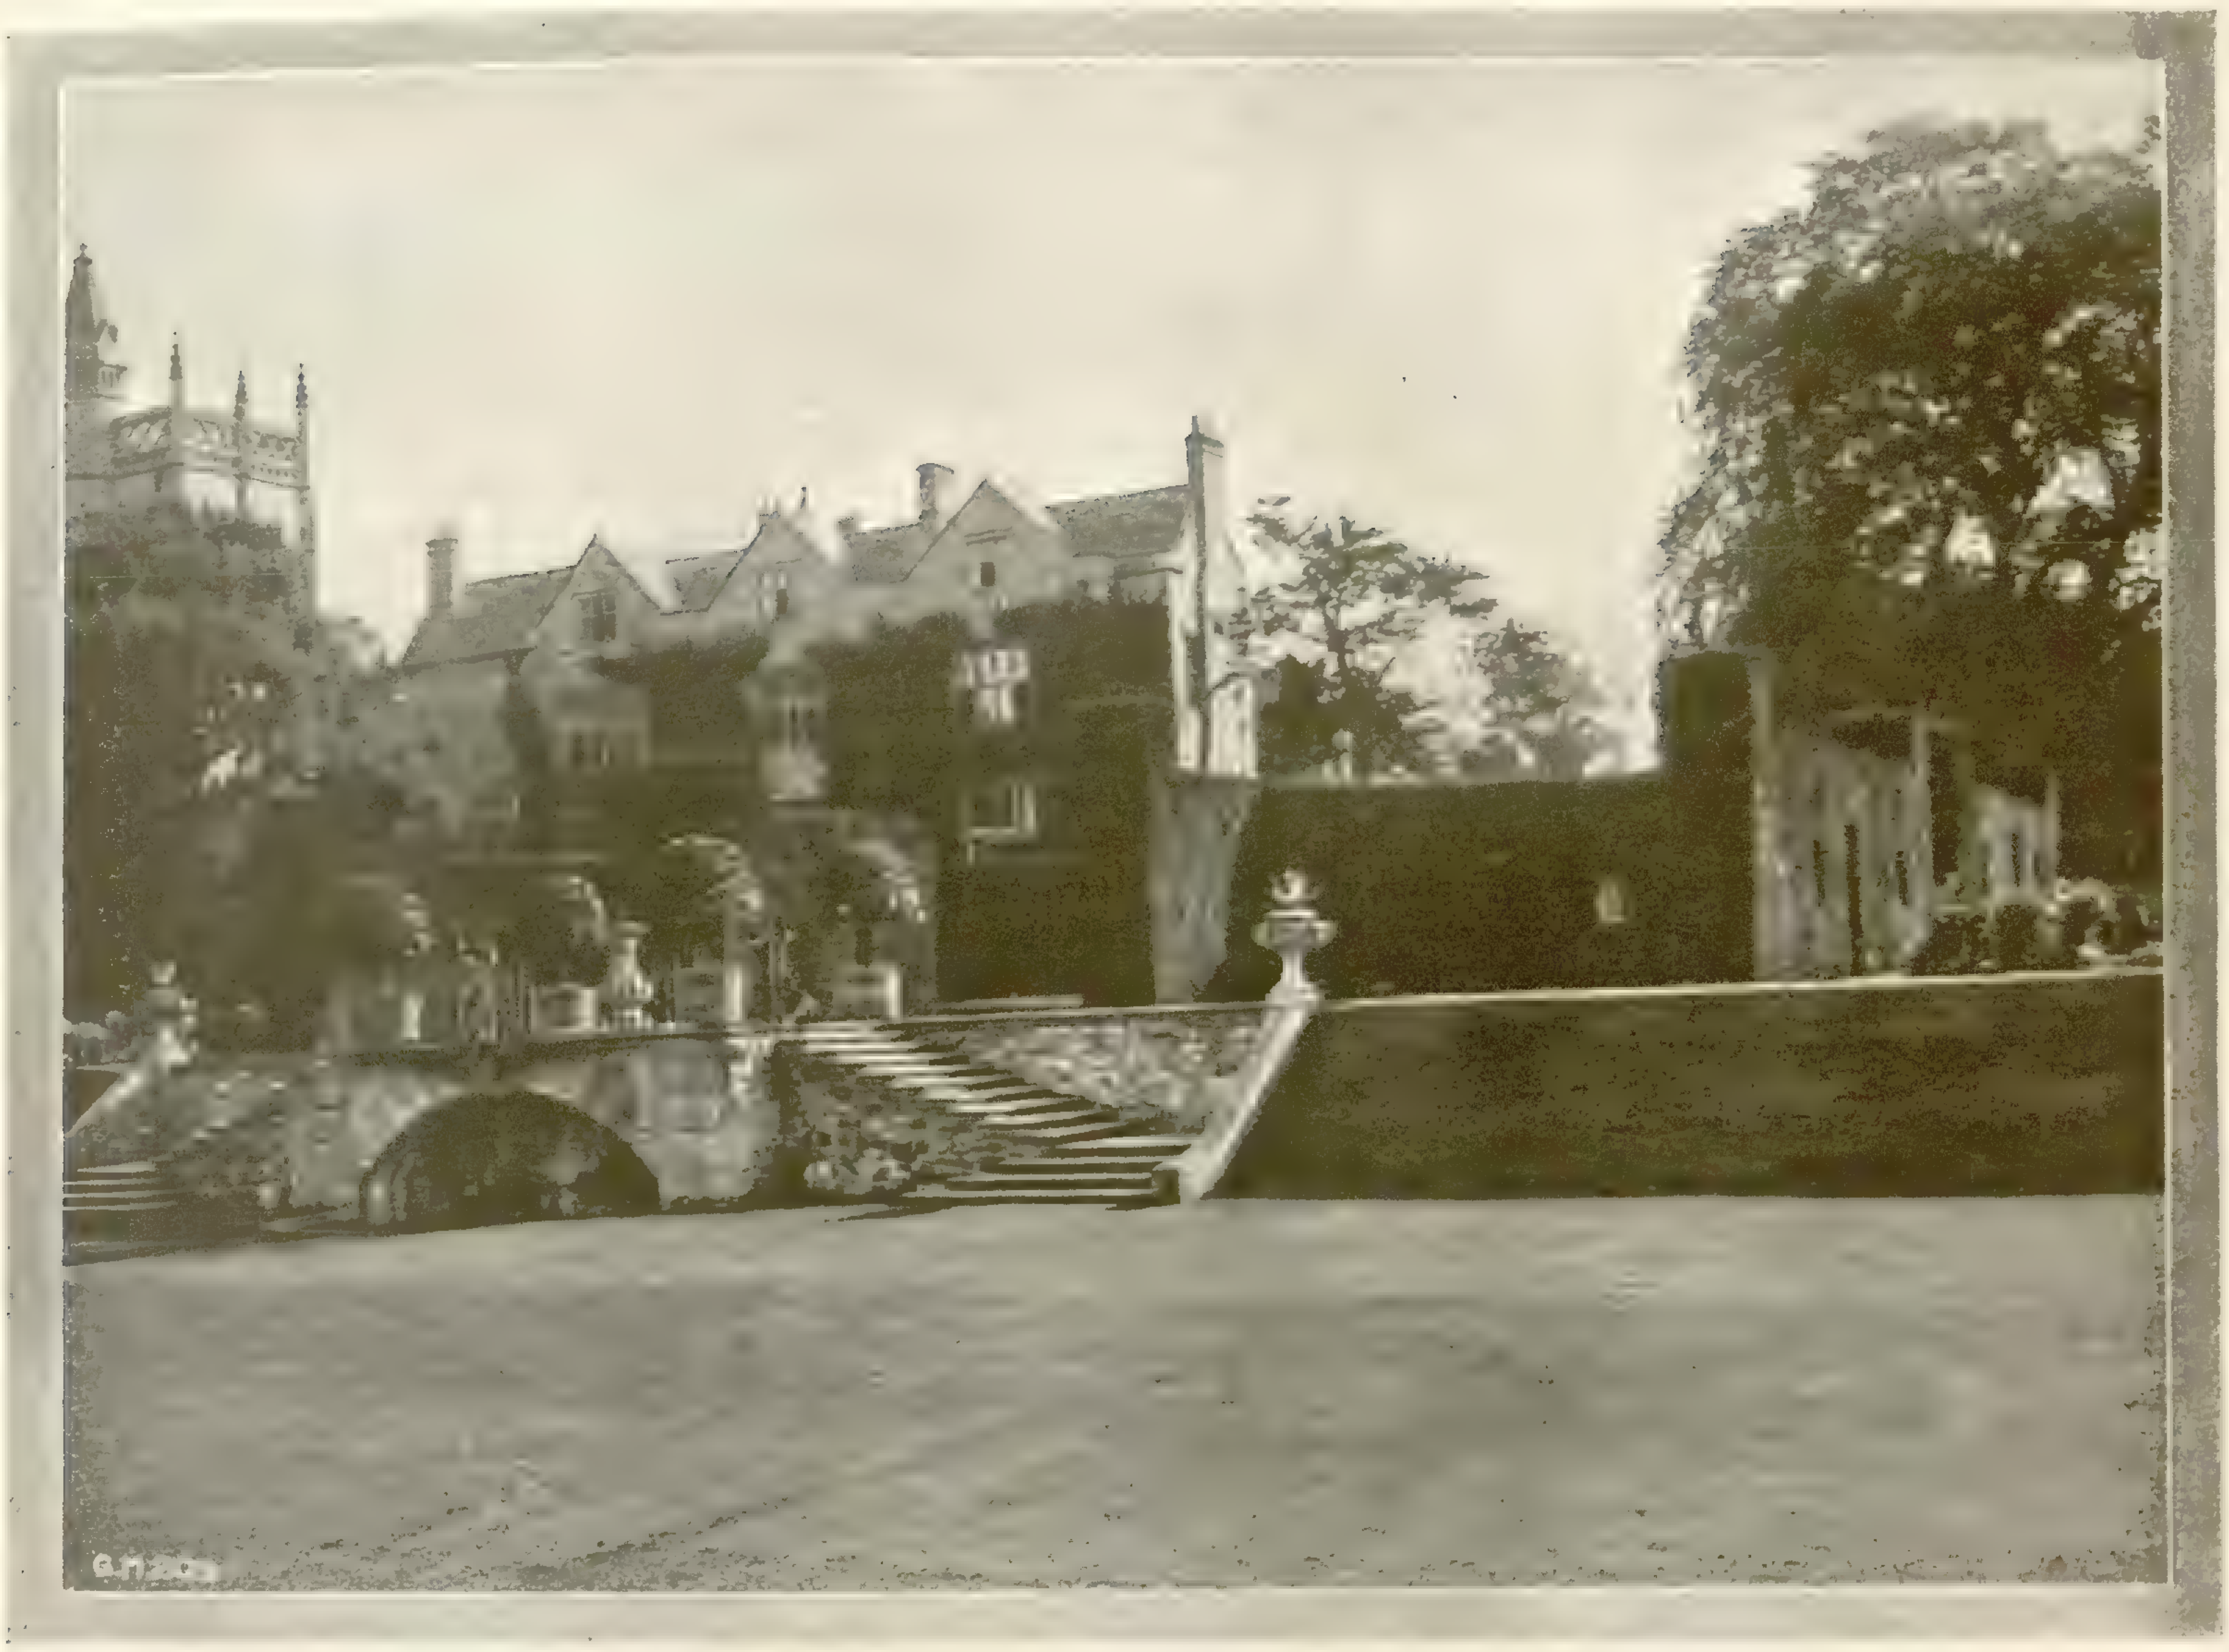
Rosa moschata grows freely in any good garden soil, but it reaches the greatest luxuriance on a chalky soil, which is probably accounted for by the fact that the subsoil is warm during winter, and therefore allows excessive moisture to pass rapidly away. If the ground is broken up—ample drainage being provided on heavy soils—and sufficient good soil added to give it a start, in two seasons it will become established, after which it requires no further attention.

Few roses call for greater judgment in planting than moschata. To enjoy its unique beauty is to see the great [illegible] wreathing a clump of pines, thujas [illegible] similar trees, up which it soon ascends, forming a cascade of blossom that sparkles [illegible] in the distance with telling effect. [illegible] should have ample shelter from north and east winds, with full exposure to the [illegible] and ought not to be planted where the pruning knife is necessary to restrain it.

Old plants transplant well, if the work is performed early in spring; care must be exercised in lifting; the roots be carefully pruned, and the top growth be cut hard back. The first season it recovers [illegible] check, flowering freely the following and in subsequent years.

THOMAS SMITH.

Walmsgate, Louth, Lincs.



BARROW COURT, FLAXBOURTON, BRISTOL.
(The Residence of H. M. Gibbs, Esq.)

SOME BRISTOL GARDENS—I.

An historian has written, "Bristol, the capital city of the West of England, has been distinguished for its commerce from a very early period, and was for many centuries the second city in the British dominions." Everyone knows that to this famous port, city, and county—for Bristol is a county of itself, lying between Somerset and Gloucester—there once came practically the whole of the West Indian trade. Small wonder, then, that the merchant princes built themselves fine houses and surrounded these with large gardens and estates, on the outskirts of this city of seven hills. Though much of the ancient trade and glory have departed from Bristol, it is yet a fine city. The River Avon runs through the city, and boats of considerable tonnage come right up to Bristol Bridge, in its centre. In the matter of public parks and gardens, Bristol does not seem to be very well served, but it has one of the finest open spaces that any city could have, and this is Durdham Down and Clifton Down, which are practically one, and extend from the elegant suspension bridge at Clifton right beyond Stoke Bishop towards Westbury-on-Trym and Henbury. It is a grand piece of rolling country, left pretty much to nature, although at various times young trees have been planted to eventually replace those that are already old.

It were an easy matter to fill many issues of the GARDENERS' MAGAZINE with descriptions and illustrations of gardens in and around Bristol, and it must not, therefore, be taken for granted that those gardens dealt with in this and the succeeding issue are far and away finer than all else in the district, or the only ones worthy of mention. Limits of time for visiting and space for describing have to be sharply marked out, so readers generally and Bristol friends in particular will please understand that at present we give but a fair sample of the many good gardens round about this western city, and that in the not far distant future we hope to give another selection.

Barrow Court.

A few miles west by south of Bristol, where the land begins to rise in wave-like foot hills towards the higher levels of the Mendip Hills, and amid peaceful surroundings and delightful scenery, Barrow Court is charmingly set. The nearest railway station is Flaxbourton. To the left, rather more to the south-east, and beyond Barrow Court, Dundry Hill rises 700ft. high, surmounted by its old church tower. Straight ahead is the Dial Quarry, and further on again is Brockley Coombe, a spot frequented by the poet Coleridge, and one from which a beautiful view is obtained; he wrote:

"Ah! what a luxury of landscape meets
My gaze! Proud towers, and cots more dear to me,
Elm-shadow'd fields, and prospect bounding sea."

One could not wish for fairer country than this part of Somerset. Long, long years ago, other folks admired this district, for here, where Barrow Court now stands, was once a nunnery. The present house is a fine old Elizabethan mansion, with a paved courtyard and a pretty church so close by its side as to form part and parcel of it. A very distinctive garden surrounds Barrow Court, and the owner, H. M. Gibbs, Esq., has preserved all that was good of the old style, and added much that is good in the more modern style of gardening. The stout yew hedges, some old, some young, and some only now in course of development, provide seclusion and shelter such as the modern garden does not afford, and they are entirely in keeping with the house and its ecclesiastical inheritance.

The accompanying illustrations will serve admirably to show the character of the Barrow Court gardens. Here and there the thick, closely clipped, and dense yew hedges, cut to represent battlemented walls, are pierced with door-like opening through which one passes to other enclosures or out into the open spaces. In other cases window-like openings have been cut, and yet again, in the thickness of the yew walls, and always on the inner side of an enclosure, recesses have been cut and comfortable seats placed therein. Closely-clipped standard bays, hollies, and Portugal laurels, in tubs, stand at the head of the several flights of steps, as in the view of the house, while others have their place in the yew enclosures. The warm corners of these enclosed gardens are veritable sun traps, and each has its quota of sub-tropical plants in tubs. Here "in a nook with a book," one could pass many pleasant hours.

An ornamental lily pond fills the larger part of one of these old gardens, and in the view given the scene is carried beyond the lily-decked water into another retreat, where a handsome urn marks the centre of a little garden of old-time and fragrant flowers. Throughout the whole of this portion of the Barrow Court gardens fine urns and handsome vases mark the intersecting pathways, or ornament the terrace walls. The vases yield their meed of beauty, too, because they are filled with flowers in the summer time. There are also several ancient sun-dials, each in its proper place.

Outside the yew hedges there are several big and bold beds of hardy herbaceous flowers and also of roses. Beautiful lawns extend beyond the terrace slope, and here are the tennis courts, and still further out is a first-rate cricket ground that must be a delight to play upon. Westwards, towards the park, these beautiful lawns spread until they are brought to a pleasing conclusion by a large semi-circular screen-like railing of considerable height and great beauty. The central feature consists of handsome pillars that carry gates of exquisite workmanship. On each side of these gates are six pillars, each surmounted by a finely carved female head. These represent "The Daughters of the Year." On the left January commences the series, and on her breast are snowdrops. February and March follow, the latter with a cluster of daffodils. April has spring flowers, May has hawthorn, and June has a bunch of roses. To the right of the gates July takes up the tale, and presently comes September and October with fruits and grain, November with chrysanthemums, and finally, close-hooded December, with holly and mistletoe, finishes this beautiful set of figures, than which nothing could well be more appropriate in connection with garden scenery.

In an exactly opposite direction another pleasing and entirely different scene presents itself. The green turf now extends down a long avenue of fine lime trees, all clean-stemmed standards in the vigour of lusty youth. Alternating with these tall graceful trees, and in the ample intervening spaces are standard round-headed hollies, and so, when the limes are leafless there is still a green line along either side of this broad grass walk. At the far end, in a bold crescent-shaped shelter are convenient seats from which one may look along the lime vista across the lawns to the Daughters of the Year. Behind the lime trees, on each side, collections of flowering trees have been carefully planted, and lilacs, syringas, and spiræas are especially fine.

Crossing the terrace one comes upon a small formal flower garden, with its strictly kept box edges and hedges. Opposite this, and very near the house is an ancient Tithe Barn, a very fine bit of old English work, and in a fine state of preservation. It serves for various purposes, such as concerts, cricket suppers, balls, and dances, and on occasion, a religious service has been held in it. Near by an old pit has been converted into a pleasing water garden, where irises are a special feature.

Leaving this portion of the grounds and passing to the more utilitarian portion, we are reminded at the entrance to the kitchen and fruit garden, that "God giveth the increase," this old text standing out boldly over the gateway. Particularly effective is the long, straight, and sloping central walk, part of which is seen in the accompanying illustration. Mr. Mincher, the able head gardener, does not believe in excluding the beautiful from this necessary part of the gardens, and so we find long borders of hardy herbaceous perennial and annual flowers the whole length of this garden walk, and other flowers along the lower walk that extends the whole width of the garden and ends in a fine summer-house.

The horizontally trained trees shown in the illustration will interest many readers, but at present I shall only say of them that one may travel far and not find any so good as these seven-year-old apple trees. They are beautifully clean and well trained. The glass department is not a large one, but the several structures, which were built about twenty-five years ago by Messrs. W. H. Smith and Co., Bury St. Edmunds, are well suited to the various purposes to which they are put. Apricots and peaches do not do well here out of doors, the soil being a stiff clay-loam. Eucharis is well managed, and the popular orchids that are so useful for floral designs find a place among the plants necessary to such an establishment as Barrow Court. Schizanthuses, Rehmannia angulata, Crassula coccinea, Clerodendron fallax, clivias, standard fuchsias, Impatiens Holsti, and Francoa ramosa, are a few other subjects that Mr. Mincher grows largely and well.

LILY POOL AND OLD GARDEN AT BARROW COURT, NEAR BRISTOL.

It were an easy matter to linger long at Barrow Court, and dwell at considerable length upon its many characteristics and excellences, but for the present this [illegible] notice must suffice. There are other things to tell of at a later date, if the fates are kind.

Ashton Court.

Among the many notable places in and around Bristol none is better known than Ashton Court, Lady Smythe's famous residence. The Court stands on rising ground, in the midst of a finely-wooded park that was enclosed and planted in 13[illegible] [illegible] Thomas de Lyon. From Bristol, [illegible] Court is about three miles distant, [illegible] south-westerly direction. The Court [illegible] many historic associations. It was once the residence of Sir Richard Choke, [illegible] Chief Justice of England, who died in [illegible] and the battlements, buttresses, and [illegible] gateway of the ancient building still remain, though the whole of the extensive and beautiful front of the Court, 150ft. long, is the work of Inigo Jones, and was erected in 1634.

The Ashton Court estate is an extensive one, and the gardens, also on a large scale, have a well-deserved reputation. Below the windows, all along the fine garden front of the Court, is a dense continuous mass of the pink-flowered Escallonia macrantha. A broad lawn spreads away in front of the Court, and is bounded on either side by a low ornamental wall that serves in each case to form a background for hardy flowers, chiefly herbaceous and annual, that are planted in broad borders. Great care is taken to produce large masses of colour, to associate the colours pleasingly, and to arrange for a floral display from early summer until late autumn. Herbaceous lobelias, coreopsises, sweet peas, gladioli, Galtonia candicans, chrysanthemums, Michaelmas daisies, spiræas, campanulas, salvias, and a host of other subjects are brought into use in these borders, and no small amount of skill is needed to maintain them in perfect condition for many months, for it must be remembered they are in full view of the Court.

THE LIME AVENUE AT BARROW COURT, NEAR BRISTOL.

At the western end of the Court there is a small and simply constructed rock garden, designed by the late Mr. Meyer not long before his death. It occupies rather a curious position at the extremity of the garden, and on the edge of the park, and it contains fine collections of alpine shrubs and saxifragas. The carriage drive, seen in the illustration of the rock garden, terminates at the front entrance and older part of the Court, where a very fine old Magnolia grandiflora spreads over the walls. The terrace on which the Court stands ends abruptly at the western end, and one descends by a long steep flight of steps, close to the rock garden, down to what is called the Wilderness. The high terrace wall is clothed with Magnolia grandiflora, and crowned with an abundance of rambling roses. In this lower garden there are many fine conifers, chiefly Wellingtonias and cupressus, but it is in no sense a wild garden, its name notwithstanding. Here is a rose garden, the beds filled with the finest H.T. and H.P. varieties. A little further on are large beds of glorious Mollis and Ghent azaleas, and big bushes of Choisya ternata, a shrub that does very well at Ashton Court. Here, too, is a "pleached alley" of lime trees, that leads to a collection of hardy ferns.

The great surprise to a stranger is to find a magnificent range of glass houses in this part of the garden, because, if the gardens are entered from the Bristol side ranges of houses and pits will have been inspected earlier, within the high surrounding walls of the kitchen garden. But here, in this lower Wilderness garden are some very fine vineries and plant houses, the whole forming a handsome range. There is no need to enter into great detail over the contents of these houses, and it may be taken for granted that Mr. H. Noble, who has been head gardener here for fifteen years, and whose reputation has extended far beyond Bristol, is a most capable cultivator. There are several large vineries, a banana house where Gloriosa superba, calanthes, and tropical ferns all find a congenial home; and a large stove where the vanilla is regularly fruited, and where the beautiful Ipomæa Horsfalliæ drapes the high back wall and yields an abundance of bluish flowers. A considerable amount of work has been done in the glass department by Messrs. Skinner, Board, and Co., horticultural builders, Bristol. Very interesting and attractive is the Grotto, a glass-covered rock-fernery, where the gentlemen of the house frequently come to smoke. It is a spacious house, designed by Messrs. Pulham and Son, and it is planted with Rex begonias, Ficus radicans, selaginellas, ferns of many kinds, and bamboos; it is a very pleasant and pretty retreat. The large central conservatory portion of the range is a considerable tax, owing to its extent and height; bougainvilleas are the chief climbers, while large hydrangeas, Malmaison carnations, tuberous begonias, show and zonal pelargoniums, campanulas, coleuses, cinerarias, calceolarias, etc., etc., are used in their several seasons to provide a floral display.

In front of this range of glasshouses a very broad walk extends the whole length of this lower garden, and is continued above the steps along the front of the higher ground directly in front of the Court. It is a very fine promenade, and at the Wilderness end it terminates with a comfortable wooden seat guarded by columnar cypresses. The whole length of the walk, on each side, are roses on chains, Lady Gay, Dorothy Perkins, Flora, Crimson Rambler, Leuchtstern, Hiawatha, Felicité Perpetue, and others filling the scene with beauty, and the air with sweetness. Beds of roses, rhododendrons, azaleas, etc., are cut in the grass near the walk.

An interesting part of the flower garden is that where, on sloping ground, and with narrow winding paths, choice shrubs have been grouped in masses. Hardy heaths and dabœcias, olearias, ceanothuses, spiræas, **Prunus triloba**, hypericums, hardy fuchsias, vincas, blue hydrangeas, and rare lilacs are here set out in bold groups, and liliums, galtonias, and a few roses are associated wth them. The association is a pleasing one, and everything is arranged so that it can be inspected at close quarters.

Quite a long way from the Court and the Wilderness garden is the kitchen and fruit garden. These departments are nearer Mr. Noble's house, and are surrounded by high old walls that give shelter to large numbers of peaches, nectarines, pears, cherries, and roses. Kitchen garden crops of all kinds are grown on a large scale, and there is evidently ample work for each of the thirty-one pairs of hands under Mr. Noble. The peach cases are a feature of the department, and the trees are finely trained. Strawberry forcing is a rather big item, and some large deep frames are found very handy for the later supplies. Mr. Noble does not believe in big vine borders, and certainly the Muscat and Black Hamburgh grapes lack nothing in crop or finish. Figs are largely grown, and from one tree of Negro Largo, five hundred and twenty-five fruits were gathered last season. That reminds me that here, as in not a few other big gardens, an account of everything produced is kept, so that it is an easy matter to determine what crops or trees or houses are more or less productive as the seasons pass. Melons are favourite fruits with Lady Smythe, and a long supply is maintained. Mr. Noble grows Sutton's Scarlet and Blenheim Orange largely, but lately he has also added a very big scarlet-fleshed variety that is named Shavington Hall, the seed having been brought from Scotland. It is a splendid cropper, and of good flavour, but the fruits are too large for all but large families.

"THE DAUGHTERS OF THE YEAR," BARROW COURT, NEAR BRISTOL.

There is much to be seen and learned at Ashton Court. Its fine deer park, its Domesday Oak, its big fruit room, and its bothies and mess room for the men, all merit attention, but there is only room now to say that Lady Smythe takes the keenest interest in her estate and gardens, and also in the many that are employed therein.

Downside.

Downside, the residence of W. E. George, Esq., is at Stoke Bishop. The gardens and grounds, with the little model farm cover about a hundred acres, and every part shows the good taste of the owner and the great interest he takes in it. The many-gabled house is amply draped with climbers, of which the small-leaved ampelopsis is chief. Here, as in almost all of the Bristol gardens visited, there are terraces, the lay of the land making these a necessity. It must be remembered that Bristol, like ancient Rome, is built on seven hills.

Downside has many attractions for a horticulturist, it has an unusually fine range of glasshouses, a big kitchen garden, a brilliant flower garden, long herbaceous borders, a quaint old-time pleasaunce, and also a fine selection of the best trees and shrubs, the latter serving alone to give it distinction. On opposite sides of the west front of the house are two very distinct gardens. The one, on a square lawn, is given over to beds that are filled in spring with a bright selection of tulips, daffodils, wallflowers, and other popular spring flowering plants, while in the summer they are gay with tuberous begonias grouped in masses of one colour, with larger beds of taller subjects, flowering and foliage, that serve to enhance the gaiety of the begonias, pelargoniums, etc. The other garden is a rectangular one, surrounded by clipped yews and flowering shrubs, and containing old-fashioned hardy flowers, and beds of fragrant roses.

Some fine views over well-wooded country are obtained from the terrace, but the most striking outlook is from the long garden below the terrace wall. Here are the tennis courts, and the fields beyond slope down to the farmstead. Golden hollies, splendid masses of Berberis Darwini, a fine old cedar of Lebanon, and a big deodar are features of this part of the garden. A long straight walk that skirts the tennis lawn ends in a picturesque tea house, and from this pleasant retreat the view extends right away down the valley to the south-west, out to the open water of the Bristol Channel.

On the north-west and north sides, the grounds are sheltered by larch and elm woods, and within this shelter there are large belts of trees and shrubs containing numbers of fine plants that receive careful attention at the hands of Mr. Scott, who is well aware of the great evil that results from overcrowding. The value of such belts of the finer trees and shrubs is not always considered in relation to its value to the garden and grounds generally. In many places a good strip of ground might be well prepared and carefully planted with only the best material, and then, as years pass, and the trees and shrubs increase in size, such a plantation serves as a nursery from which well developed specimens may be drawn to beautify other parts of the grounds. The remaining trees and shrubs have thus room to develop properly, so that the original plantation and the garden proper alike profit by the undertaking.

Deodars, Abies Douglasi, A. Parryana glauca, Cedrus atlantica glauca, Cupressus macrocarpa, and its handsome golden variety lutea, Cryptomeria elegans, and retinosporas in variety are among the largest and most handsome of the conifers. The thorns are largely planted, as are the flowering plums and cherries, especially along the portions visible from the house. Shrubby spiræas, laurustinuses, viburnums, Berberis Darwini, B. stenophylla and B. Thunbergi, magnolias, and laburnums, are all effectively grouped; here and there are also contoneasters, a handsome plant of the Knap Hill oak, and several very strong examples of Buddleia variabilis and its varieties; the latter are regularly cut back each year, as they are best managed in this way and make large, spreading, and elegant bushes. Where this plantation meets the new carriage drive there are bold masses of Rhus cotinus and R. typhinus, that give fine bits of colour in summer and autumn. Groups of golden yews, hollies and retinosporas are planted on the lawn close to this approach to the house.

No pains have been spared to make the glass department a success. The teak-wood vineries and the heating arrangements were in the hands of Messrs. Mackenzie and Moncur; they are very fine lean-to houses, and grapes, chiefly Madresfield Court, Muscat of Alexandria, Mrs. Pince, Alicante, Black Hamburgh, and Gros Col-

HERBACEOUS BORDERS IN THE KITCHEN GARDEN AT BARROW COURT, NEAR BRISTOL.

THE ROCK GARDEN AT ASHTON COURT, BRISTOL.

mar are produced in abundance in them. In a large stove there is a very fine allamanda on the roof, while deciduous dendrobiums, chiefly D. Phalænopsis Schroderiana, are very largely grown. A fernery, with the ferns and selaginellas all planted out in rock work, is very pretty. The conservatory is kept gay with flowers grown in the ample greenhouses and pits at Mr. Scott's command, and much might be written about their contents. Carnations and pentstemons are very popular at Downside, and these are cultivated in the borders on either side of the kitchen garden paths. Bush apples are good, and Mr. Scott speaks highly of the merits of Stirling Castle, Newton Wonder, and Bismarck. Late peas are in great request, and, in addition to the Gladstone and Late Queen, the variety named The Bell, distributed a year or two ago by Messrs. Bell and Bieberstedt, of Leith, has been found remarkably useful.

There is only one thing that seems at all out of place at Downside, and it is the circular lily-pond in the centre of the kitchen garden. It is a beautiful piece of work, in terra cotta, but its usefulness and beauty are lost, wasted, in its present position. Mr. Scott has a very pretty cottage at one end of the kitchen garden, and near the glasshouses, and it is almost smothered with ampelopsis and roses, Dorothy Perkins being much in evidence. The grape room and the apple room are very finely planned, and in handy positions. Figs flourish on the old garden walls, but with a reference to a huge Phormium tenax that flowers very freely in a corner just outside the kitchen garden, near the herbaceous border, these notes must conclude.

It should be added that Mr. Scott is hon. secretary of the Bristol Gardeners' Association, and he has been mainly instrumental in placing the association in a good financial position.

Elmfield.

A delightfully pretty place is Elmfield, the residence of A. Shipley, Esq., J.P., at Westbury-on-Trym, midway between Bristol and Henbury. The garden was formed some thirty-six years ago, and is remarkable for its gaiety and first-rate upkeep. Mr. Shipley is very proud of his charming garden, and, under the kindly influence of an interested employer, Mr. Wakefield has every inducement to display his skill to the full. No heroic measures have been adopted at Elmfield, but there is a brightness, neatness, and generally well-cared-for appearance pervading the whole place that raises it above many of its neighbours.

Set at a considerable elevation, lying open to the south and west, and sheltered from the north and east by rows of grand old elms, the gardens are in an excellent position and only liable to suffer from an unusually furious south-westerly gale. Flowering trees and shrubs have been judiciously planted along the drive sides, and in beds, and as specimens on the lawns. Prunus Pissardi, P. triloba, pæonies, berberises in variety, shrubby veronicas, select rhododendrons, lilacs, laburnums, and viburnums are a few of the plants boldly grouped.

Where the drive sweeps round to the front entrance to the house ample room has been allowed for a broad herbaceous border in front of the shrubs, and, as a rule, this part of the garden is very gay from spring to late autumn, and thus forms a striking contrast to similar parts of other gardens, where the commonest and dingiest shrubs so often appear to be regarded as the proper accompaniment to the front door. Goodness only knows why this should be so, for, while first impressions are not inevitably the best, there is no doubt they count for a good deal. From the entrance gate to the front door Elmfield gives a visitor the impression that here is a bright, homely, and beautiful garden, a little Paradise of fragrance and colour, and that impression deepens as one enjoys the fine lawns, the stately trees, and the woodland path.

Large crescent-shaped beds are cut in the lawn, and some are filled with hardy herbaceous plants and others with a selection of dwarf roses. Specimens of the golden yew, purple beech, Berberis Darwini, and pampas grass adorn the lower part of the lawn, but care has been taken not to spoil the greensward by over many specimens and beds. In the double border that leads along from the front of the house hardy and tender subjects are both used; this permits of a spring display of bulbs and an autumn display of dahlias. The bulbs used in this part of the garden are transferred to the little bit of woodland or semi-wild garden, or to the borders, between the shrubs wherever there is room for them.

A tiny path among a group of conifers leads to a wider path that skirts the garden proper, and is entirely hidden from it. This is a pleasant surprise, especially in the spring time, when multitudes of daffodils, bluebells, double and single wood anemones, and other early flowers are in full bloom. In summer time it affords a cool and shady retreat, and there are several little nooks where inviting seats are placed. A wicket gate at the end of the path gives access to the kitchen and fruit garden where peaches and pears on the one side and Morello cherries on the other, fill every bit of wall space. All the walls are fitted with iron brackets to carry a protecting coping or shelter for the wall fruit trees. There is a small rose garden here, and beyond are the well-kept vegetable quarters margined with healthy bush apple trees.

Elmfield is a very compact place, and its glasshouses are arranged behind the house

THE GROTTO AT ASHTON COURT, BRISTOL.

close together, and thus their heating and general management are rendered as easy as possible. The three vineries provide good crops of Lady Downes, Madresfield Court, Muscat of Alexandria, Buckland Sweetwater, and Black Hamburgh grapes. The houses are span-roofed, and so unusually sharp-pitched that in a bright summer some light shading becomes necessary. The contents of the plant houses show that Mr. Wakefield is as much at home under glass as in the garden outside. His calanthes, splendid gloxinias, streptocarpuses, and the inevitable Begonia Gloire de Lorraine, at once display his cultural ability. Anthurium Andreanum, brilliant crotons, and large, splendidly grown standards of Acalypha hispida (Sanderiana) are of chiefest interest among the many stove plants. Nerines and vallotas are grown in large batches, and of the former there are many very large old specimens.

There are three nice houses of orchids, and though no especially rare hybrids or varieties are grown, the collection is a good one, a plantsman's collection and not a specialist's. A few kinds that are much in evidence by reason of the extent of their culture and their fine condition, are thunias, Miltonia vexillaria, Epidendrum vitillinum majus—a very great success—Odontoglossum crispum, O. triumphans, Cœlogyne cristata, Cypripedium insigne, C. Charlesworthi, C. Rothschildianum, Cattleya Trianæ, C. Dowiana aurea, C. Lawrenceana, deciduous dendrobiums, and Oncidium varicosum.

The big camellia house is rather unusual in these days. It has a sunken floor, and in it are planted out some large camellias and azaleas. Close by is the conservatory, a very pretty but not large structure. The central feature is a very fine Trachycarpus excelsa, which flowers annually in May, a handsome palm that will soon outgrow the limits of the place; even now its tub is sunk several feet below the level of the conservatory floor. Streptosolen Jamesoni is trained up the slender surrounding pillars, and bougainvilleas and roses are trained under the roof. Achimenes in pots and pans provided the leading floral display at the time of my visit, but there were also groups of show and zonal pelargoniums, Francoa ramosa, Rehmannia angulata, Lobelia tenuior—very popular in the West, liliums and campanulas, the whole making a very attractive display.

Chas. H. Curtis.

⁂ The second of the two illustrated articles on the gardens round Bristol will appear in our next issue (May 23).

CACTUS DAHLIAS.

Notes on New Varieties.

The chief interest in the dahlia is still closely centred round the cactus section, and is likely to be for some years to come. No doubt some of the more recent sections deserve a certain amount of attention, but nothing like to the same extent as the popular cactus varieties.

Although the general public perhaps do not purchase a large number of the new dahlias owing to the comparatively high price, still a number of enthusiasts do make a selection each season from the varieties offered. The novelties are undoubtedly the chief attraction at our large exhibitions, and there can be no question that the stream of new varieties undoubtedly helps to swell the ranks of dahlia growers. The novelties of 1908 are fairly numerous, and many of them of the highest merit. It is difficult to judge the merits of a new dahlia the first season, because we have to simply form our opinion as to value from the blooms that appear before us, and I fear many people are disappointed with the plants when they see them growing. The trade growers and old dahlia fanciers can pretty well judge how a variety is going to grow from its very appearance. As an instance, most of the large heavy flowers hang down from sheer weight of the bloom, while those that do not contain so many florets are generally carried erect. It is pleasing to note, however, that an improvement is taking place in this respect. A type that requires watching is the one formed by varieties that only produce short flower stems. This defect is readily noticed in a novelty by the stems, and the removal of six or eight pairs of leaves tells its own tale.

Space will not allow descriptions of a long list of varieties, but those enumerated will all be found thoroughly reliable: Rev. A. Bridge, Helium, Saturn, Harold Peerman, C. E. Wilkins, Etruria, and Dr. G. G. Gray struck me as being the best of those being introduced by Messrs. Stredwick and Son, although some of the fancy varieties are distinctly better than those already in commerce.

Mr. H. Shoesmith has a really fine set, and those that impressed me most were: Charles H. Curtis, Flame, Elsa Ellrich, and Snowdrift; while from Mr. J. T. West we have Mrs. W. Baxter, Rosa Starr, and W. T. Rogers, all of which will give a good account of themselves on the exhibition tables. Messrs. T. S. Ware, Lim., are introducing Cynthia, which will be appreciated by lovers of large flowers.

Mauve Queen from Messrs. J. Cheal and Sons will also prove useful. From Messrs. Keynes, Williams, and Co. we have nine varieties, some of the best being: Foxhunter, Spanish Prince, and Killarney. We have from Messrs. Burrell and Co. Celia and Hilda, both distinct and beautiful.

I am under the impression that our raisers are paying far too much attention to the varieties that can be best described as shades of yellow and pink, and in some instances they have so far failed to recognise the importance of distinctness. In conclusion I have just another grumble, that is in the selection of names. In at least a dozen cases we have a name that is repeated in the cactus, show, pompon, and single sections, which causes no end of confusion, not only to the trade growers, but to the general public also.

J. B. Riding.

Esher Horticultural Society will hold its summer exhibition on Wednesday, July 29, and, by permission of the Sandown Park Company, the show will be held on the famous Sandown racecourse.

VIEW OF THE HOUSE AND GARDENS, DOWNSIDE, BRISTOL.

STONE FRUITS GROWN IN POTS.

In the colder and uncertain districts in which fruit growing is a precarious undertaking, the orchard house becomes in reality a necessary equipment in any up-to-date garden. Orchard-house fruits do not always assume their full size, at any rate, not when grown in pots, but perhaps to some degree what is lost in bulk is amply repaid in quality, for it is well known how full flavoured indoor fruits become under intelligent cultivation. Varieties are not all alike suitable for this restrictive principle, but there is ample of material to choose from for all purposes and seasons, and a selection of stone fruits should embrace plums, apricots, peaches, nectarines, and cherries.

Plums.

These have a distinctly pleasing aspect growing successfully in pots, and they fruit with marked regularity as regards crop and season. Except in unfavourable districts the dessert varieties are those most valued, for the simple reason that only when the scheme is an extensive one would it be profitable to attempt to grow them for culinary purposes under glass. Cooking plums certainly need not be barred, for when well ripened, they are, many of them, quite fit for dessert. Among early maturing plums Oullin's Golden Gage must be mentioned as of first-class quality; it is both productive, handsome, and good eating. So also is Washington, which follows closely in season. This has, in some years, quite a crimson flush on its golden skin, which renders it a distinctly handsome plum. The early Transparent Gage proves a great advance in this popular section. It is of recent introduction, and should be included in the most select collection. The old Transparent Gage is much later, though equally handsome and high flavoured. Some account the old Green Gage still the finest flavoured of all the Gages, and where this popular belief is favoured, it should not be omitted. Jefferson's plum grown well, equals any for handsome outline and colour, but it must not be overcropped or the quality is low, and appearance poor. It is usually extra prolific. Kirke's Black is, we consider, one of the finest of summer plums, though it has the objectionable habit of dropping from the tree as soon as ripe. Without doubt, the highest value is set upon late kinds of plums, and as these, many of them, will hang until they shrivel, they may be made to serve an extended season under glass. Coe's Golden Drop, Late Orange, Archduke, Pond's Seedling, Primate, President, Bryanston Gage, and Reine Claude de Bavay are some that can be depended on to give crops lasting and enjoyable.

Cherries.

These give fruits freely in pots, and when well fed assume a size equal, if not superior, to those grown in the open. They require most careful treatment in the matter of watering and ventilation once they approach the ripening period; they are very liable to crack if any excess of vapour occurs, or if they are not kept uniformly moist at the roots. Once split they quickly become a prey of flies or wasps, and often early decay is set up in consequence. A few varieties suffice for pot-culture, and may include May Duke, Early Rivers, Bigarreau Napoleon, Bigarreau Schrecken, Governor Wood, Belle d'Orleans, Black Tartarian and Guigne de Winkler. The last-named is a particularly good late variety, being quite fresh and crisp in mid-October. Black Tartarian is a handsome large-fruiting kind, of exquisite flavour.

Apricots.

These are not so often cultivated indoors, as they are rather impatient of the confinement of the glasshouse. They therefore need special treatment, and a more liberal use of the ventilators. If placed by themselves at one end of the structure they are more easily accommodated. They are readily amenable to the demands of the orchard house in their growth and fruiting, as they bear on short spurs, and pinching of the summer shoots provide these in plenty. The Large Early is a fine apricot, large, distinct in shape and colour, and free-bearing. Grosse Peche, or peach apricot, is another large and distinct, and free to fruit. Moor Park is too well known to need comment. Hemskirk, always a favourite for succession, is followed by Shipley's, sometimes known as Blenheim.

Peaches.

The culture of pot peaches has become an almost universal practice, and the manner in which they respond to this restrictive culture makes them dependable and popular fruits. Really very fine fruits may be had from well managed pot peach trees, and there is not, as far as we have ascertained, much to choose between varieties as regards their productiveness. The new American variety, Earliest of All, comes in advance of Waterloo and Alexander, two other American varieties. Except for the sake of variety no one need grow the last two kinds, for they differ so little in their characteristics. Hale's Early is a good early peach that can be depended on to bear freely large, well-coloured fruits. Duchess of Cornwall and Duchess of York are comparatively new, one early, the other late, both of them desirable kinds, to add to the general collection. Amsden June fruits at the same time as Waterloo, and, if needed for very early forcing, is more trustworthy. Grosse Mignonne, Condor, Crimson Galande, Bellegarde, Stirling Castle, Barrington, Dymond, Sea Eagle, Thomas Rivers, a new late sort of fine colour and size, Princess of Wales, and Golden Eagle comprise an assortment of the best of the well-tried peaches.

Nectarines.

The same remarks are applicable to these which are said of peaches, they differ only in their flavour and having smooth-skinned fruits. New additions to the lists come somewhat slow, though there is even now ample for the requirements of most persons. The advent of Early Rivers brought the forced nectarine into a much more favourable position, and Cardinal comes as a stepping-stone to still further progress. These are invaluable fruits for the orchard house in pots. Lord Napier is still a good successional sort, providing large, sweet, well-coloured fruits after Early Rivers is over. Elruge, a favourite of past days still retains a place with some, as does the larger-fruited Stanwick Elruge. Dryden colours beautifully, grows large, and has a fine flavour. Rivers' Orange, Pine Apple, Darwin, and Humboldt are yellow fleshed nectarines possessing the finest flavours, free in bearing, and healthy in growth. Goldoni is an extremely bright and attractive fruit succeeding in pots. It is not of the largest size. Newton, Spencer, and Milton are good late kinds belonging to the white-fleshed section, possessing not quite the same sugary sweetness as Humboldt or Pine Apple. They are, however, indispensable where a large late supply is sought, and all do well in pots. Periodical pinching of the summer shoots, especially the stronger ones, constitute the principle work among pot-grown trees, reducing these at the winter pruning, so that sun and air has free access to every part of the tree. It is fatal to high colour development if the summer shoots are allowed to crowd themselves unduly, and this needs to be borne in mind when disbudding is attended to in spring. In the daily syringing of the fruit-bearing tree some care is necessary in having water free from pond or lime deposits, the first-named in particular giving a highly objectionable aspect to ripening peaches; and nectarines cannot, even though they have smooth skins, be freed from pond deposits. Where rain water can be had this is far preferable for syringing the trees.

W. STRUGNELL.

NOTES FROM SCOTLAND.

The unusually severe weather that was experienced over the greater part of the country in the closing days of April wrought considerable damage in some places. As would naturally be expected, the more favoured districts in respect to climate have suffered most, owing to vegetation being more advanced than was the case of those less sheltered. Here, in the extreme South-West of Scotland within a short distance of the sea, the thermometer on several mornings registered from 12 to 16 degrees of frost, and the protection of snow that was so much in evidence in some districts was here wanting.

Plum and cherry bloom upon walls was about half expanded, and all is now destroyed and hanging limp upon the trees; while much that remained in an unopened state it is feared has suffered injury. Apples and pears are probably unharmed, as, except in the case of an early variety occupying a favoured position, neither kind was showing colour. Red and white currants will certainly be a light crop, from the cause stated, while black currants appear to have escaped fairly well. Strawberries, too, are probably safe, as few, if any blooms were open, but growers for market upon the open field system hold opinions the reverse of this.

Among hardy plants growing entirely in the open the destructiveness of the frost becomes daily more evident, as not only are many, as spiræas, lupins, and delphiniums, badly cut, but many of the hardier shrubs that are very seldom affected by low temperatures have their foliage discoloured, and many of the more immature shoots destroyed.

Early planted potatoes, both in fields and gardens, were, at and previous to, the frost visitation, making good progress, but all are now reduced to pulp, the stems being rendered soft much below the ground line. Growers of large quantities of bedding and vegetable plants have sustained severe losses, as these, in many instances, were removed from the protection of glass and placed under such improvised coverings as mats, branches, and other ready-at-hand material to ward off the effects of such frosts as are usually provided against such this season, but such materials were in this case quite ineffective.

Vegetation in unheated houses and frames has also suffered badly, tomato growers in several instances having to deplore the loss of the leading shoots if not the whole plant. Rain and fog have now succeeded the cold snap, and growth is fairly rapid, but withal the season must now be late, and fruit crops, it is feared, below the average.

JAMES DAY.

CROPPING FRUIT TREE BORDERS.

I have been prompted to send some notes upon this subject from having been asked my opinion upon whether it is advisable or not to crop fruit tree borders with vegetables. This is a matter of importance and of great interest to gardeners, and is the more deserving of consideration because of its bearing upon the maintenance of a supply of general garden produce that most of us are expected to keep up. It is not, therefore, the fruit trees and their crops alone that have to be taken into account.

If considered from the standpoint of fruit trees alone most of us would doubtless, unhesitatingly declare in favour of giving up the borders entirely to the roots of the trees, be they apricots, peaches, pears, or any other sort. The great importance of keeping the roots of fruit trees near to the soil's surface by the aid of mulchings, etc., so that they may to a greater extent promote wood growth of a fruitful description has been constantly impressed upon our minds both in practice and in theory throughout our gardening career, and there is, I think, no question that if the borders were entirely devoted to the roots of the trees, and otherwise managed for their sole benefit, better crops of wall fruit would be more generally procured than is now the case.

At the same time it is doubtful if the extra fruit that might be thus obtained would compensate for the sacrifice of early vegetables that we should by this practice be called upon to make. I have come to this conclusion after reviewing the various rules of practice I have seen followed during my gardening career, and notwithstanding the fact that the borders for indoor fruits are invariably, in so far as any radical interference with the roots of vines, peaches, etc., are concerned, looked upon as being almost sacred. I know, all the same, only too well, that fruit trees upon walls are not always in that perfect condition that might be expected, but digging and cropping the border are not by a long way alone responsible for the injury sometimes attributed to them.

Digging the borders to within 3ft. or 4ft. of a fruit wall, when done regularly, does not mutilate the tree roots to the extent that it is sometimes supposed to do, for the simple reason that there are but comparatively few roots, other than those made annually, within the spade's reach, though certainly the roots are in this way induced to keep deeper than would be the case if the border was left undug, carefully mulched, and otherwise well attended to. Undoubtedly this is injurious to the trees, but not to the extent that it would be if the soil was of an ungenial character.

Deep-rooting, combined with heavy manuring, does, however, in many cases create serious evils, by promoting disease and coarse, strong growths which are one of the chief causes of sterility; and yet this can, however, be corrected by root-pruning, which has usually to be resorted to whether the borders are dug or not. The vegetable crops also rob the soil of its manurial properties and its moisture, though the latter is in a measure counteracted by the shade afforded by the crops; but each of these evils can be rectified by artificial means. Few gardeners, or their employers, would, I venture to say, care to sacrifice their earliest crops of outdoor potatoes, peas, French beans, cauliflowers, etc., for the chance of securing a slightly better crop of wall fruit. Altogeth it seems far better to follow the old custom of cropping borders and make the most and best of them. Walls are really deserving of erection if for no other purposes than that of forwarding crops of early vegetables, and affording shade to others during the height of summer.

T. COOMBER.

RAISING APPLES FROM SEEDS.

It is superfluous to say that the apple is far and away the most popular and extensively cultivated of hardy fruits, but in view of this fact, it is somewhat remarkable that the raising of new kinds and their cross-fertilisation has been undertaken by only a very few growers.

The work is of an interesting nature, but it calls for considerable patience and perseverance, as the percentage of useless forms, inferior in every way to the parents, is very great, and we gather from one of the leading experts in this country that it is not at all unusual to fail to produce amongst a large batch of several thousands of seedlings, a single form to equal those already under cultivation, and, further, that upwards of one-half are not far removed from the wild crab. It should be explained that this applies to seeds saved from choice kinds without cross fertilisation.

It is interesting to note that the majority of our best and finest apples have resulted from chance seedlings. Seeds taken from Ribston Pippin produced that superb variety Cox's Orange Pippin. Cornish Gillyflower and Devonshire Quarrenden are responsible for John Gidley and Worcester Pearmain respectively in the same way. We cannot trace the pedigree of Devonshire Quarrenden, Blenheim Pippin, and Ribston Pippin, and other instances may be quoted ad lib.

From the foregoing remarks, it will be seen that the prizes are few and scantily bestowed, even when the work is taken up seriously, and the amateur who cares to try his hand should proceed in a systematic and methodical manner, and effect a cross between two kinds of sterling merit. Within the next week or two the matter must receive attention, and now is the time to consider and decide upon the programme in order that steps may be taken when the flowers are expanded.

The work is simplicity itself, and the veriest tyro or novice has excellent material to work upon. Apple blossoms are well adapted for cross-fertilisation, the anthers being numerous, and they arrive at maturity very gradually. It is advisable to cover the blossoms it is intended to operate upon, just before they develop, with thin muslin, the object being to keep insects at bay. Then there must be the removal of anthers and importation of pollen from another variety.

When grown from seeds the results are not seen for at least four years, and even then we can form but a vague idea as to the value of any fruit that presents a promising appearance, as their flavour, fruiting, and keeping qualities, etc., have to be put to a severe test. A number of our leading fruit growers and specialists hasten the matter by grafting the two-year-old growths of seedlings on suitable stocks, but this is altogether too hazardous a speculation for amateurs generally, and the few stocks that are purchased or are created by cutting back inferior kinds, may be utilised.

WALTER H. AGGETT.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CATTLEYAS. — Many of the summer-flowering cattleyas are interesting subjects at the present season; such species as C. Schroderæ, C. Mendeli, C. Mossiæ, and the numerous showy hybrids usually flowering at the present season, are, owing to the late season, in a backward state. Where plants are retarded by their flowers being so long in development, there is always the risk of undue strain being placed on them, and this is bound to be followed with more or less ill effects, which may not be apparent until the following season. Where delay has been thus caused in flowering, it is advisable that flowers should be removed from the plants as soon as possible after they have expanded. There is generally a period at which the plants are in practically a dormant state, between the flowering period and that in which they produce their new growths. Careful watering is desirable at this period, only sufficient moisture being required to maintain the pseudo-bulbs in a plump state. As soon as new growth commences more liberal treatment may be given.

CATTLEYA WARSCEWICZI (Gigas), in its varied forms, is the finest of all the C. labiata group. It has the reputation of being a shy-flowering species, but a great deal in the success or failure to flower it depends upon the conditions under which the plants are grown, and the treatment they receive in the early stages of growth. I am of opinion the longer C. Warscewiczi can be kept from starting into growth the greater the prospect of successful flowering and the less chance will there be of secondary growth, which is one of the chief troubles. There are two distinct types of this species, although both are among the best of the cattleya species to cultivate. One type is shy-flowering, and unless the plants can be grown under cool conditions until growth commences, and then be placed in a position where they may obtain the maximum light, they can be rarely induced to flower. I have known plants of this type in cultivation for many years without flowering. The free-flowering or Sanderiana type, is not nearly so difficult to manage, and if care is observed not to over water until growth has well advanced, and the plants are suspended close to the root glass in a position where they may obtain the advantage of all the available light, little difficulty is experienced in successfully flowering them. I consider it is quite time enough to afford liberal root moisture when the growth has advanced so far that the flower sheath may be seen inside the unfolding leaf. Up to this stage only sufficient root moisture is necessary to keep the pseudo-bulbs plump.

WHITE VARIETY.—From the experience I have had with the white C. Warscewiczi Frau Melaine Beyrot, it appears to be one of the most free-growing varieties in cultivation, breaking freely from dormant eyes on the back pseudo-bulbs, as well as from the leading growths, in a most remarkable manner. We grow it suspended at the south end of the cattleya house, where it obtains full light. It is so distinct in habit of growth from the type that one is tempted to express doubts as to its being a form of C. Warscewiczi, but a decided opinion on the matter should be deferred until we are better acquainted with it. It is a plant worthy of a place in all prominent orchid collections.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

TREE CARNATIONS.—The present is an anxious time for growers of tree carnations, as early-struck plants in small pots will need repotting and staking, and there is usually at this time of the year a press of other work. An effort, however, should be made to get them shifted before becoming pot-bound, as they are liable to refuse to grow freely, and sometimes they turn yellow and sickly. Before removing them fumigate slightly twice, giving the foliage a good syringing after each fumigation, and as the nights are often cold all through May, the plants are best kept in a cool, airy house until quite the end of the month. Great care is needed at all times in watering carnations, but more especially after potting and until new roots are working freely in the soil.

WHITE STOCKS.—These are now to be seen in quantity in Covent Garden Market. The Brompton and the East Lothian are both grown, but the latter is the favourite. For purity and fragrance nothing can excel a good strain of Lothian stock. For early blooming the seeds should be sown towards the end of May, and the young plants shifted along, so as to have them well established in 6in. or 7in. pots by the autumn. They can then be subjected to a mild forcing, and this is the surest way of getting early bloom; but for the main supply a simpler method is pursued. The plants are put out under glass in autumn and under such circumstances they give a wealth of bloom in April and up to June.

WINTER-FLOWERING BEGONIAS. — Cuttings should now be put in. About one leaf may be taken off at the base and the cuttings put in just deep enough to keep them firm. The beautiful and useful Begonia Gloire de Lorraine, which has been flowering during the winter, will now be making a few shoots from the base, and these will make good cuttings. They should be taken off when only about an inch or so long, as if left they soon begin to show bloom, and after they have set their bloom they are of no use as cuttings unless taken off two or three joints below where the first bloom appears. Where good cuttings can be had there is little difficulty in rooting them. Put them into light sandy compost, and keep quite close in the ordinary propagating pit, and they will not be long in striking root; care should be taken not to give too much moisture. Most of the Rex type may be propagated from leaves, but such sorts as Mme. Lebourg, Mme. Peratto, and others which branch freely may be established more quickly from cuttings. All the begonias will root freely in cocoanut-fibre refuse, but they should be potted as soon as they have a start, as if left too long the roots spread, and they suffer when taken up.

HYDRANGEAS.—Shoots which have failed to flower will make good cuttings. Many of the strong-flowering plants will also produce lateral shoots, which make good cuttings. These should be put singly into small pots. The cuttings must be kept close, and well shaded until they are rooted, when they must be gradually exposed, and before they begin to make growth should have all the light and air possible. The most important point is to secure short-jointed growths, and to ripen them off early in the autumn. Hydrangeas may also be propagated during the autumn after they have set their flowers for spring, but these do not produce such large heads of bloom as the spring-struck plants.

THE TUBEROSE. — For late blooming, with strong, sound bulbs, heat is not necessary provided there is no excess of moisture. To get bloom in September and later I pot firmly in sound loam with a little coarse sand, about the third week in May, placing the pots in a cold frame, and giving one watering if the soil is dry to settle it firmly round the roots, and not watering again for some weeks, when the roots will have been made, and the top growth is just pushing up. In some seasons even frame protection is not necessary. The only difficulty is an excess of moisture at the start, and to be on the safe side, under glass in a cold frame is the safest place for them, as roots must be made in advance of the foliage. In this way growth is robust, and the lights may be removed in a few weeks, or the plants plunged in cocoa-fibre under a north wall. There is little gain in keeping the bulbs too long out of the soil, as if potted and kept rather dry they do not shrivel, and growth later on can be retarded by placing the plants in the open. — T. B. FIELD, Ashwellthorpe, Norwich.

THE FLOWER GARDEN.

WEATHER.—The severe snowstorms and blizzard of the 25th ult. will, in many places, have done a considerable amount of damage to trees, shrubs, and spring bedding, and where this is so the evil must be remedied in the best way possible. Examine trees and shrubs, support damaged boughs, and remove broken ones. Where climbers were torn from their supports they must again be tied up. Here, in Lancashire, we escaped the blizzard, and three inches of snow was the heaviest fall we had.

LOOKING FORWARD.—Carefully note the effect of spring bedding as plants are in bloom, and of early-flowering herbaceous plants, with a view of arranging for another season. May-flowering tulips, English and Spanish irises will soon begin to open; doronicums, trollius, saxifragas in variety (especially the well-known old S. umbrosa, or London pride, large masses of which, with tulips or iris coming through them, produce a fine effect) should also be noted. S. Wallacei, on the rockery, is a most desirable kind, and S. umbrosa makes a good carpeting in shaded parts of woods or the wild garden, but do not plant it where water-hens can get at it, or in the winter time they will soon destroy it.

SUMMER BEDDING.—If a plan of the summer bedding has not yet been settled upon, either mentally or on paper, it should at once be attended to. The mixed style of bedding, with its more subdued harmonies of soft colours, seems each year to be more and more replacing the old style of massing bright colours in large quantities; but indiscriminate planting must be avoided. In large gardens, where there are a goodly number of large beds to fill, some of them should still be filled with masses of one colour, always arranging or placing the brightest colours farthest from the chief point of view, with softer colours near at hand; the eye then travels over the soft colours to the brighter ones. Where large and long borders have to be filled the mixed planting, if not more noticeable at first sight, is ultimately more interesting than the ribbon border, with its continued design of a few bright colours, especially where the display is required for a long period, but in these good masses or clumps of one thing are preferable to a large number of single plants scattered all along the border. Make the border pleasingly informal, not relegating all the very tall plants to the back row, but using some as dot plants irregularly along the border. Strong poles, with climbing roses, gourds, or other climbers also give a pleasing effect, as do clumps of sweet peas in separate varieties. When planting all mixed borders or clumps guard against having large spaces devoid of flowers for any prolonged time, or the general effect will be spoiled. As one subject passes out of bloom adjacent ones should be coming on, and this can generally be accomplished if due care is given when planting.

SUGGESTIONS FOR PLANTING.—No hard and fast rule can be laid down, as position and circumstances must always be considered. Different shades of scarlet and crimson seldom harmonise when adjacent to each other; where a mass of scarlet is decided on an edging of white, yellow, or light blue will suit; pink may have white, yellow, or light lavender with it; sometimes double rows may be used, and one pleasing mixture is yellow and bronze calceolarias alternately in the second row, with blue lobelia and the little white Alyssum maritimum alternately in the front row. Where mixed beds are used the tall ones may consist of palms, eucalyptus, Melianthus major, Cannabis gigantea, eulalias, nicotianas, Chilian beet, wigandia, Rehmannia angulata, maize, pentstemons, solanums, scented-leaf geraniums, etc., etc., with an edging of Dactylis glomerata variegata, or other similar plant; a bed of this sort should not have any dwarf carpeting. A carpeting of Alyssum maritimum, with large plants of dark heliotrope above, looks well, with taller liliums above them. On a carpet of alyssum, dwarf single scarlet dahlias and Acacia lophantha above them, looks well. Always try and arrange to have a number of sweet-smelling plants near the residence, the perfume being specially welcome in the cool of evening.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

RASPBERRY BEDS. — These should be examined and any fresh growths which will not be wanted for fruiting next year, or for stock plants, may be removed. The strong growths should be left, and the weaker ones pulled up. If desirable the young growths may be lifted carefully with a small portion of roots and planted on a shady border. These, if kept moist, will make nice planting canes by the end of the season, and is a good way of increasing stock. Keep the land free from weeds, and provide a mulching over the roots on both sides of the row. Heavy, deeply worked land need not be mulched yet, but on light land raspberry canes benefit very largely by the aid of good mulchings and heavy watering in dry weather. In some gardens it is the practice to crop between the rows of raspberry canes with lettuce, early cauliflower, or turnips. The rows, however, need be a good distance apart, so that any digging done does not interfere with the roots of the canes. Intercropping is not advisable when the rows are only about 5 or 6ft. apart. In dry weather the hoe should be kept going amongst gooseberry and currant bushes, so that the weeds may be kept in check.

STRAWBERRY BEDS.—All our fruiting plants have been bedded down with litter, which, owing to the heavy rains, has become nicely bleached, so that no trouble will arise in that direction. The growth of late has greatly improved, and a nice lot of flowers is visible, although on some plants not very strong as yet.

DISBUDDING. — This work will require much forethought and attention from now onward, so as to keep pace with the growth. An active hand can do much of this work, if kept at it, in a comparatively short space of time. The trees should be attended to at intervals, and should not be allowed to become crowded with useless shoots before removing a part of them, peach trees in particular. Any blistered leaves ought to be pinched off and taken away to the fire heap.

CHERRY, PEAR, and PLUM TREES on walls need in turn to be dealt with, and any new growths not wanted for any particular purpose may be rubbed or pinched off. Keep a keen eye on all the growths wanted for training in and building up of a good, well-balanced tree. All protecting materials may now be gradually removed, and as soon as the weather is safe dispense with them entirely. Keep a sharp look out for aphis, and if any put in an appearance lose no time in cleansing the infested parts. Quassia extract is dependable and safe. Tobacco liquor, fir tree oil, etc., are other tried remedies, and, when used as recommended on the labels, will be found both effective and safe. A few good syringings ought to rid the trees of insects. Syringe overnight with insecticide and apply clear warm water with force in the morning.—H. MARKHAM, Wrotham Park Gardens.

The Green-flowered Tulip (Tulipa viridiflora).—There are always a certain number of people who care for the curious in the way of tulips and other flowers, and a reminder of the green-flowered Tulip, Tulipa viridiflora, may not be unwelcome to them. It is, to all appearance, a derivative of T. gesneriana, and has blooms of much the same character as the type of our garden varieties, but its flowers are of a pale greenish-yellow and green, and are thus pretty aptly named. It is a wonderfully hardy tulip, and seems to survive well without replanting after a rest. I have grown it for a good few years, and although it increases but little, it always survives. I grow it in rather light and dry soil as a permanent plant.—S. ARNOTT.

SOUTH SHIELDS and NORTHERN COUNTIES CHRYSANTHEMUM SOCIETY.
ANNUAL EXHIBITION
in the
ROYAL ASSEMBLY HALL, SOUTH SHIELDS,
on WEDNESDAY and THURSDAY.
November 11th and 12th, 1908.
£150 IN PRIZES, 7 SILVER CUPS, MEDALS, etc.
FIRST PRIZE FOR 36 JAPANESE, £10.
Entries close November 6th.
Schedules and all particulars from ALLEN PURVIS,
Albany Chambers, King Street, South Shields.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shilllings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

MAY 12.

A beautiful day served to bring crowds of visitors to the exhibition on Tuesday, and those who came saw a splendid show of plants and flowers that filled every corner of the hall with beauty and fragrance. The display was as interesting as it was effective and extensive.

FLORAL COMMITTEE.

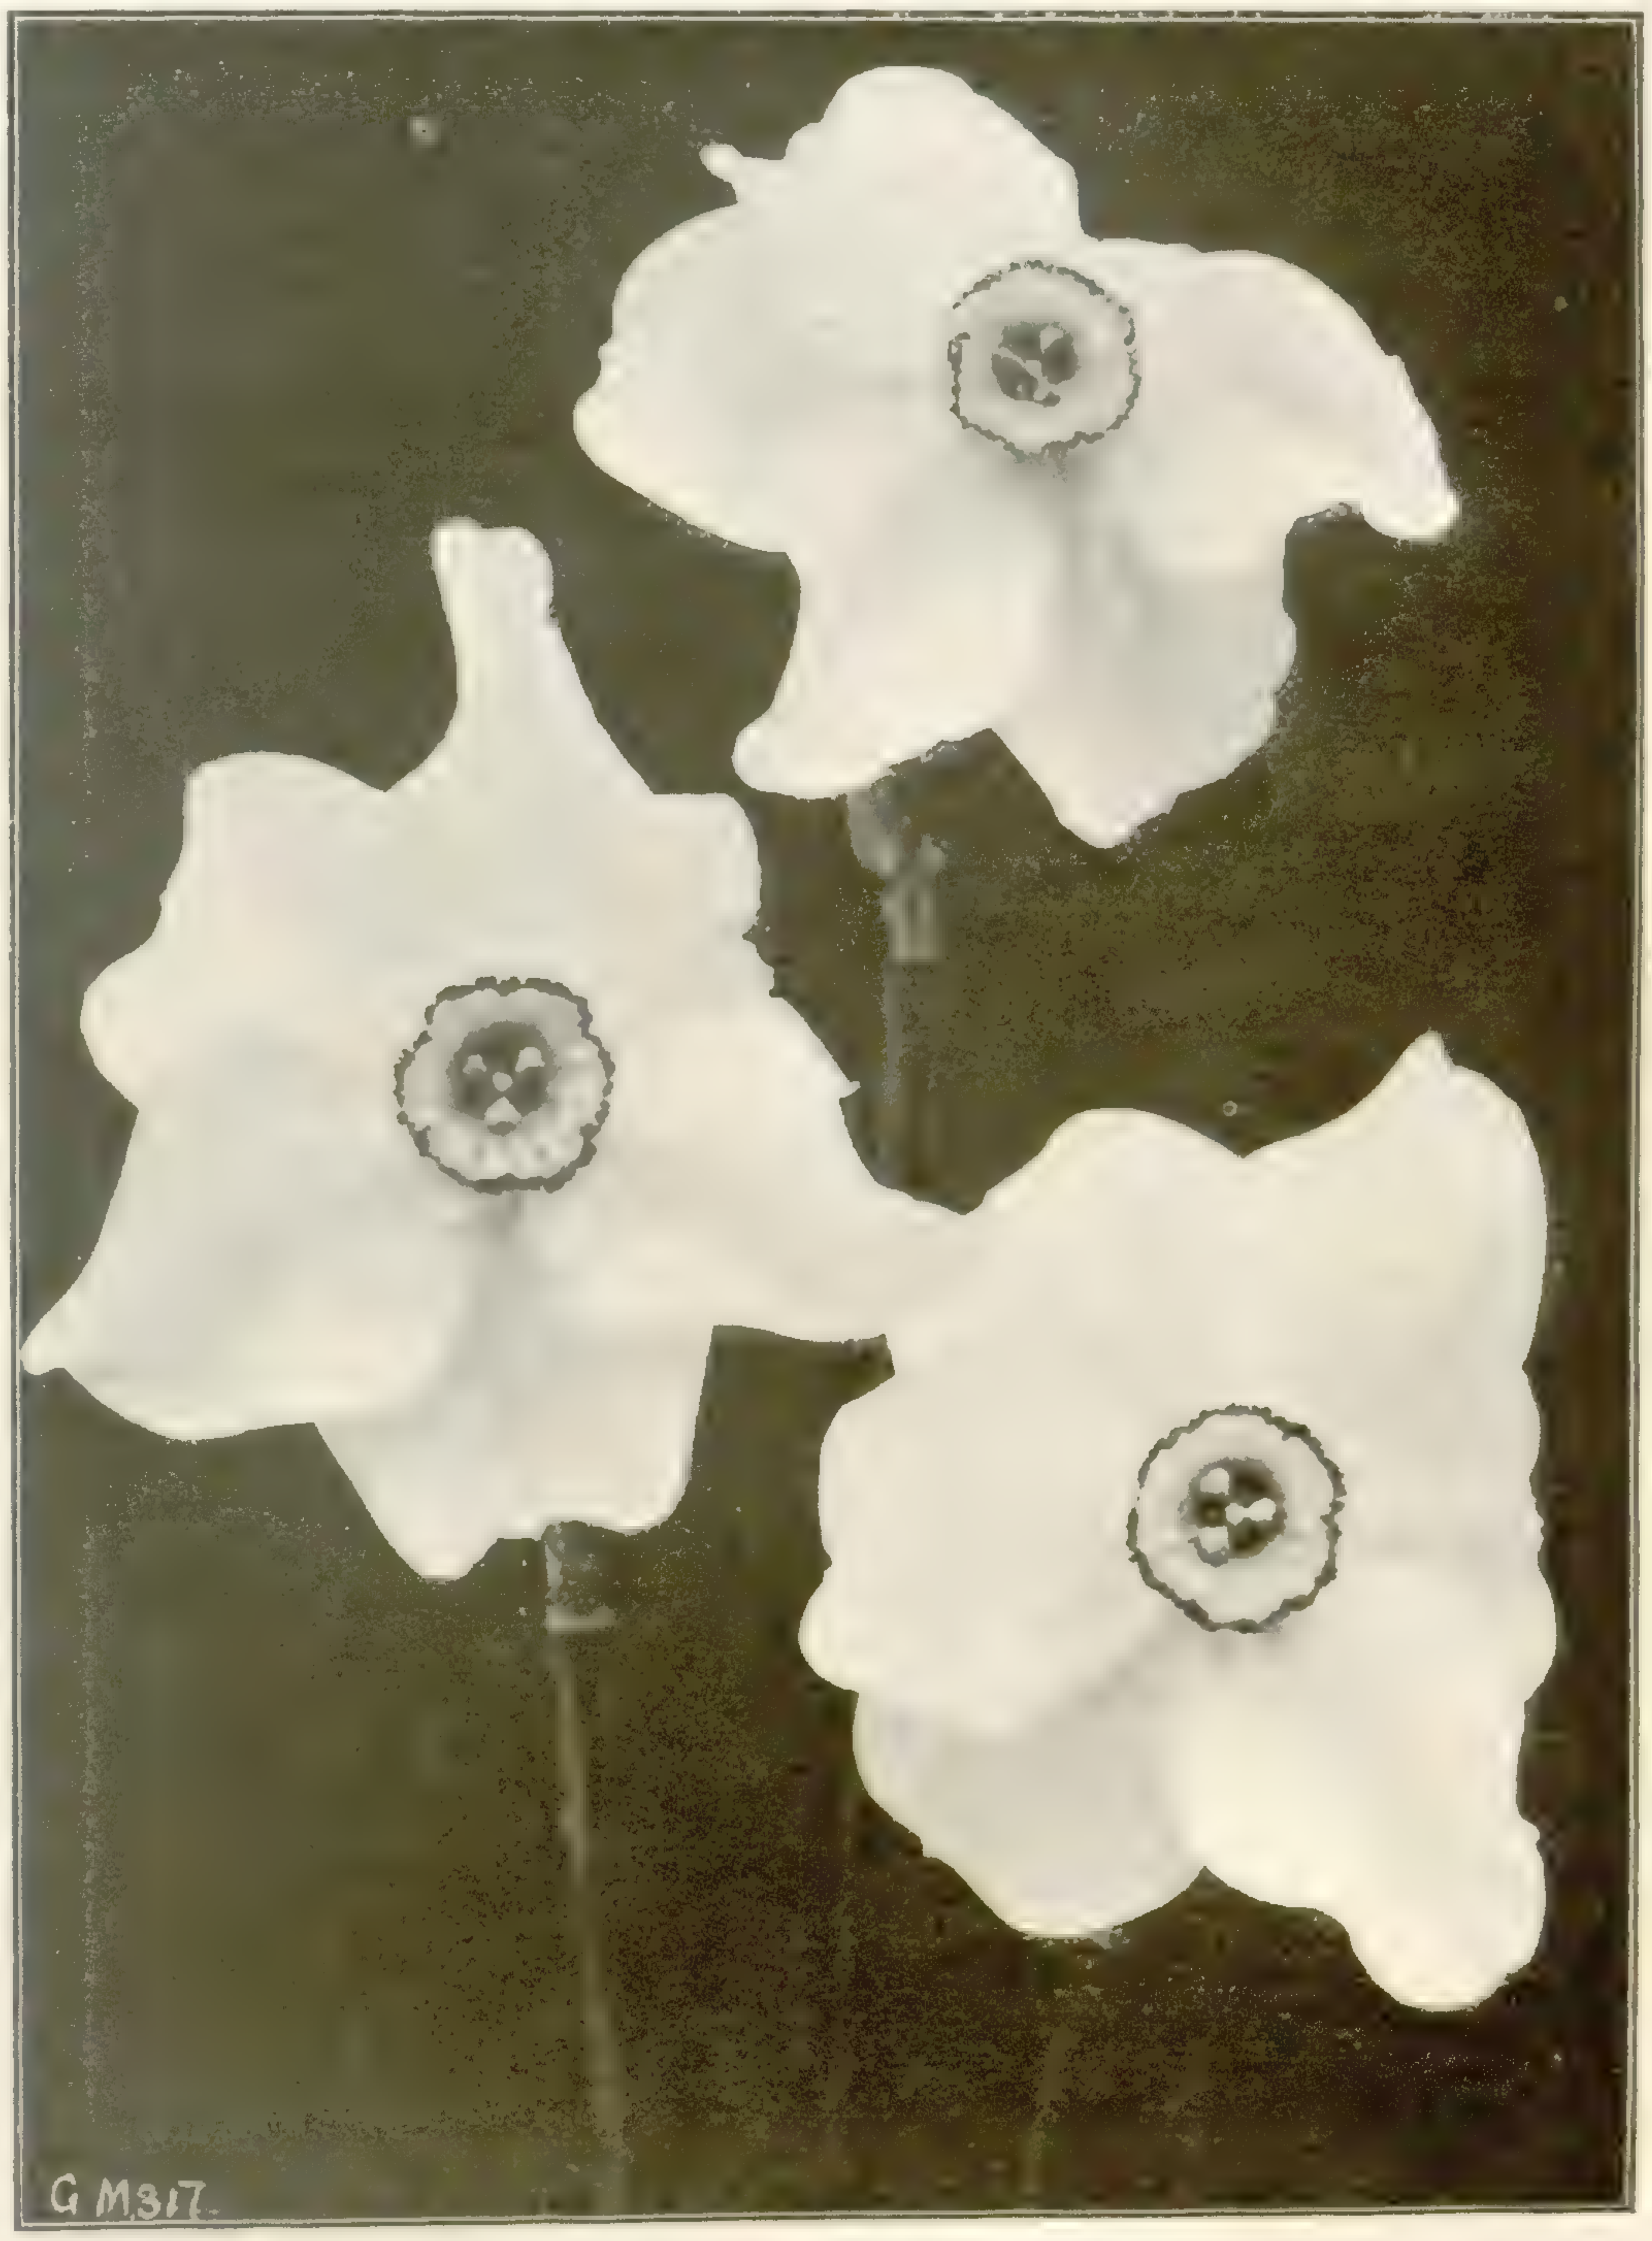
Sprays and branches of flowering trees and shrubs were exhibited by Messrs. J. Cheal and Sons, Crawley, and conspicuous in their display were Pyrus malus floribunda, P. Riversi, lilacs, cytisuses, berberis, etc. Mr. R. Gill, Penryn, Cornwall, showed some wonderful rhododendrons, the trusses of R. grande, R. Gill's Triumph, R. Kewense, R. Falconeri, and R. Beauty of Tremough attracted a great deal of attention, as also did the branches of the gorgeous and beautiful Embothrium coccineum. Rock and alpine plants were sent by Messrs. Heath and Son, Cheltenham, whose principal plants were Ramondia pyrenaica, Primula Veitchi, Corydalis Wilsoni, and Aubrietia Dr. Mules. Mr. J. R. Box, West Wickham, was also an exhibitor of alpines,and his Gentiana verna, Saxifraga muscoides albo-purpurea, and Dodecatheon Hendersoni were leading features. Messrs. Cooper, Taber, and Co., Southwark Street, S.E., submitted blooms of the Algerian, American, and English strains of winter-flowering sweet peas; the former showed the widest range of colours.

A splendid exhibit of hardy ferns, filling the whole end of the hall, was arranged by Messrs. H. B.May and Sons,Edmonton. Space does not permit of a detailed description, but we may say that the varieties of Scolopendrium vulgare were wonderful in their frilling and tasselling, that the osmundas were fine, and the Lady ferns particularly beautiful, especially the Plumosum varieties. The Messrs. May also sent gardenias,petunias, verbenas, etc. Mr. W. H. Young, Mercury Nursery, Romford, contributed the narrow-leaved bright red Coleus salicifolius nanus, a useful bedding variety. The Misses Hopkins, Mere, Shepperton-on-Thames, had a very brilliant display of primroses, alpine auriculas, and other early flowers.

Messrs. James Veitch and Sons, Chelsea, showed some beautiful cinerarias, such as Feltham Beauty, Antique Rose, Feltham Bouquet, etc., all very beautiful. The firm had also some very handsome grandiflorus hybrids of schizanthuses, Arum Mrs. Roosevelt, and the golden R. Elliotiana, Statice Sworowi, several colour variations of Lobelia tenuior, and Kalanchoe Ena, the latter a deep crimson hybrid between K. grandiflora and K. flammea. This firm had a fine flower of a rich rose-pink amaryllis named Doris. A beautiful display of roses was made by Mr. G. Mount, Canterbury, who had magnificent flowers of Frau Karl Druschki, Mrs. J. Laing, Ulrich Brunner, Joseph Low, Richmond, and Mrs. Sharman Crawford, with plants of Lady Gay and Dorothy Perkins.

Perpetual and Malmaison carnations were extensively and beautifully shown by Mr. C. F. Waters, Balcombe, Sussex, whose Winsor, Rose Pink Enchantress, Britannia, and Beacon were very fine. Mr. Charles Turner, Slough, contributed an interesting group of varieties of Primula Sieboldi, and a set of fine bedding varieties of violas. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a very bright and attractive exhibit of perpetual carnations, their Robert Craig, Mrs. Burnett, and Lady Bountiful showing up finely; the same firm showed good rose blooms, a few orchids, and a set of acacias, metrosideros, heaths, etc.

A small group of Ghent and mollis azaleas and forced viburnums and cytisuses were set up by Messrs. R. and G. Cuthbert, Southgate. Some lovely pure white amaryllis were submitted by Mr. C. Fielder, gardener to Mrs. Burns, South Mymmes Park, Hatfield; this little exhibit shows distinct progress, and Mr. Fielder has now quite fixed the strain. Bright hardy flowers in quantity were shown by Mr. Amos Perry, Winchmore Hill, whose display contained dwarf irises, gentians, Trillium grandiflorum, Trollius Fortunei plena, Arnebia echioides, and Phlox canadensis Perry's variety.



NARCISSUS POETICUS SNOW SHOE.

This fine new variety was shown at R.H.S. Meeting, May 12, by Messrs. Walter T. Ware, Lim., Bath, and gained an Award of Merit. The substantial flowers are pure white with red cup having a crimson rim.

Messrs. William Paul and Son, Waltham Cross, showed a grand group of roses in pots, they had Banksian roses and the wonderful Tausendschon, the latter with its huge trusses of bright pink flowers overshadowing everything else. Messrs. J. Peed and Son, West Norwood, sent a group of clematises and graceful Japanese maples. Messrs. Thomas Rochford and Son, Broxbourne, set up a big group of large specimens of Hiawatha, Leuchtstern, Lady Gay, Tausendschon, Crimson Rambler, and Sweetheart rambling roses; there were from three to five plants in a pot, and the training was rather too formal, but the cultivation was superb. Messrs. James Veitch and Sons, Chelsea, contributed some very fine hydrangeas, H. hortensia, H. Mariesi, H. Thomas Hogg, H. Veitchi, and H. mandschurica; with these were azaleas, primulas, and the fine new Meconopsis integrifolia and the crimson M. puniceus. The Misses Kipping, Hutton, Essex, had alpine plants in rockwork.

Mr. S. Mortimer, Farnham, showed some wonderfully fine polyanthuses, and the crimson, white, and yellow varieties were very pure and good. Messrs. Dobbie and Co., Rothesay, showed a fine selection of polyanthuses and a collection of lovely violas and pansies; among the violas, Isolde, Nancy Marsh, Mrs. H. Kinross, and Robert Menzies attracted our attention. From Mr. L. R. Russell, Richmond, came a showy group of Ghent and mollis azaleas, cytisus, and lilacs, suitably associated with ferns and palms. Mr. J. Holland, gardener to F. Bostock, Esq., Springfield, Northampton, showed a fine strain of large-flowered polyanthuses. The Guildford Hardy Plant Company, Guildford, submitted trilliums, androsaces, Haberlea rhodopensis, aubrietias, etc. Alpine auriculas and a few alpines came from Messrs. Phillips and Taylor, Bracknell, Berks.

Gloxinias were finely shown by Messrs. J. Peed and Son, West Norwood; these represented a very fine strain, and among the spotted varieties were many exquisite flowers. Messrs. G. and A. Clarke, Dover, sent a large selections of hardy flowers and their trollius, tulips, and anemones were striking; this firm also had a display of zonal pelargoniums. Mr. F. J. Patmore, Lymington, showed a few violas, on moss. Messrs. Paul and Son, Cheshunt, staged a number of kinds of flowering trees and shrubs; some new roses cut and in pots were also shown by this firm, and Aubrietia Paul's Pink (A.M.). Messrs. B. R. Cant and Sons, Colchester, showed rambling roses in pots, and also cut flowers of Philadelphia Rambler, Leonie Lamesch, etc.

Mr. W. H. Page, Tangley Nurseries, Hampton, showed some very fine perpetual carnations, the flowers of Enchantress, White Enchantress, Governor Roosevelt, and Mrs. T. W. Lawson being especially good. Mr. H. Burnett, Guernsey, had wonderful blooms of such beautiful carnations as Enchantress, Marmion, Mikado, Mrs. T. W. Lawson, and Robert Craig.

Messrs. G. Bunyard and Co.'s contribution of hardy flowers contained selections of tulips, aubrietias, primulas, with Arum Lehmani with pink spathes, and the brilliant Gerbera Jamesoni.

Azaleas of the amœna type, Rhododendron Pink Pearl, roses in variety, and the new Peach Blossom and Queen Alexandra spiræas were largely shown by Messrs. William Cutbush and Son, Highgate, who also had a display of particularly fine perpetual carnations in variety, and a bright yellow shrubby calceolaria named Decorator. Glorious bunches of zonal pelargoniums from Messrs. H. Cannell and Son, Swanley, made a grand blaze of colour; the firm had also a contribution of verbenas, fine hydrangeas, wallflowers, and Eynsford Pink rambling rose. Messrs. Carter Page and Co., London Wall, had a pretty exhibit of violas, a few annuals, and some very early cactus dahlia flowers.

Mr. James Douglas, Great Bookham, Surrey, had a wonderful display of auriculas, alpine and show varieties, and we regret that limits of space prevent our entering into details concerning the beauties of the numerous varieties: we will say, however, that the alpine varieties were of greatest beauty and very sweetly scented, and Mildred Jay, May Day, and Coronet gained each an A.M. Mr. Maurice Prichard made a good display of hardy flowers, and his varieties of Scilla nutans were very interesting. Mr. A. Watts, St. Asaph, sent a good strain of polyanthuses and primroses.

Mr. Thomas S. Ware, Feltham, sent a collection of hardy flowers that contained irises, saxifragas, primulas, and a few hardy orchids. Messrs. William Bull and Son, Chelsea, sent stove foliage plants, and someone sent a dozen bunches of sweet peas, but there was nothing to say from whom they came.

Mr. Elwes, Colesbourne, Gloucester, showed some handsome fritillarias and Oncocyclus irises. Mrs. Hensley, Farnham, Surrey, showed a set of flower paintings, some of which were very good. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., sent up a new and beautiful asparagus named A. filicinus (A.M.). This has flat frond-like sprays of soft green leaves or phyllodes, and is a very elegant new plant.

ORCHID COMMITTEE.

Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, showed Brasso-cattleya nivalis, Angræcum Germinyanum (A.M.), Cattleya Dusseldorfi Undine, and C. Mossiæ Goosensianum (F.C.C.), a beautiful variety with a wonderful violet-purple lip. Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester, exhibited Brasso-cattleya Heatonense Westonbirt var. (F.C.C.), a beautiful pink and yellow hybrid with an exquisitely fringed lip: and Odontoglossum crispum Zoroaster. Messrs. James Veitch and Sons, Chelsea, set up a small group of orchids that contained a fine Brasso-catt.-lælia Veitchi, numerous odontoglossums, L.-c. G. S. Ball, and a few dendrobiums.

Mr. A. W. Jensen, Lindfield, Haywards Heath, set up some good forms of Odontoglossum crispum, and a fine form of Cattleya Mendeli. Mr. Day, gardener to H. S. Goodson, Esq., West Hill, Putney, showed a small group of orchids that contained some very fine odontoglossums, Cœlogyne pandurata, miltonias, and cypripediums. Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham, showed the beautiful Odontoglossum Wilckeanum Schroderianum (F.C.C.), carrying a spike of twelve perfect flowers. Mr. Maurice Mertens, Mont St. Amand, Ghent, sent a few beautiful odontoglossums, of hybrid origin, but they were not named.

A bold group of orchids came from Messrs. J. Cypher and Sons, Cheltenham, and this was chiefly notable for its fine assortment of Lælia purpurata, odontoglossums, and a few masdevallias. Mr. Davis, gardener to J. G. Fowler, Esq., Glebelands, South Woodford, showed Odontoglossum crispum Britannia, with rather small but brightly marked flowers: he also sent O. Ossulstonei Glebelands var. (A.M.) A wonderful plant, and the most admired of the orchids, was Odontoglossum crispum Leonard Perfect (F.C.C.), shown by Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne. This carried thirteen exceptionally large and exquisitely beautiful flowers that mark it as one of the foremost of its race.

Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, showed Odontoglossum crispum Isolde (white), O. Queen Alexandra, O. illustre Theodora (A.M.), O.-c. Mr. De Barri Crawshay, and O. Urania, J. S. Moss, Esq., Wintershill Hall, Bishop's Waltham, sent the pale Odontoglossum apterum Mossiæ (A.M.).

DAFFODIL COMMITTEE.

Messrs. R. Wallace and Co., Colchester, contributed an extensive exhibit of tulips, together with a few hardy herbaceous and alpine flowers. Among their tulips we noted La Candeur, Fra Angelica, Pride of Haarlem, Circe, Glow, Flame, and Feu Ardent, all very fine Darwin varieties. Messrs. Barr and Sons, Covent Garden, had a very interesting display of clean late daffodils, and a very effective exhibit of early, double, and Darwin tulips in variety. With these they showed some charming pans of primula, irises, saxifragas, anemones, sparaxis, etc. Some choice daffodils were submitted by Mr. F. H. Chapman, High Street, Rye, and the little group contained Homer, Horace, Orangeman, Easter, Barcarolle, Brass Bell, Cassandra, and Epic.

In the group of daffodils staged by Mr. A. M. Wilson, East Keal, Spilsby, there were charming examples of Will Scarlet, Gleam, Weardale Perfection, Stone Chat, Ursula, Eoster, Homespun, Chaffinch, Horace, White Slave, Lucifer, and Blood Orange. Messrs. James Veitch and Sons, Chelsea, contributed a bright exhibit of tulips. Miss Katherine Spurrell, Bessingham, Norwich, sent a few choice daffodils, many of them new seedlings; F. C. Spurrell, Agnes Harvey, Roundhead, and Major Spurrell were very good.

Messrs. R. H. Bath, Lim., Wisbech, had a bold exhibit of tulips and daffodils; among the former Rosa Mundi, Feu Ardent, Eleanora, Rose Luisante, and Brunhilde were very fine. Mrs. Benson, South Street, Park Lane, sent a few blooms of very large Darwin tulips.

VEGETABLE COMMITTEE.

An interesting exhibit of vegetables produced under the French system of culture, was made by Messrs. James Veitch and Sons, Chelsea; it contained fine lettuces, good Veitch's Model broccoli, Gradus peas, climbing French beans, mushrooms, and Frogmore Selected tomatoes.

CERTIFICATES AND AWARDS.

First-Class Certificates. — To Cattleya Goosensiana, from Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking. Brasso-cattleya Heatonense Westonbirt variety, from Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester; Odontoglossum Wilckeanum Schroderianum, from Mr. H. Ballantine, gardener to Baron Schroder, The Dell, Egham; and to Odontoglossum crispum Leonard Perfect, from Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

Award of Merit. — To Angræcum Germinyanum, from Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking; Odontoglossum Ossulstonei Glebeland's var., from Mr. Davis, gardener to J. G. Fowler, Esq., Glebelands, South Woodford; Odontoglossum illustre Theodora, from Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks; Narcissus poeticus Snow Shoe, from Messrs. Walter T. Ware, Lim., Inglescombe, Bath; Aubrietia Paul's Pink, from Messrs. Paul and Son, Cheshunt; Auriculas Mildred Jay, May Day, and Coronet, from Mr. James Douglas, Great Bookham, Surrey; and to Asparagus filicirus, from Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking.

MEDALS.

Gold.—Messrs. H. B. May and Sons, Edmonton, for ferns; Mr. H. J. Chapman, gardener to N. C. Cookson, Esq., Oakwood, Wylam-on-Tyne, for Odontoglossum crispum Leonard Perfect.

Silver-Gilt Flora. Mr. J. Douglas, Great Bookham, Mr. G. Mount, Canterbury; Messrs. James Veitch and Sons, Chelsea.

Silver Gilt Banksian.—Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

Silver Flora.—Messrs. William Paul and Son, Waltham Cross; Messrs. Thomas Rochford and Sons, Broxbourne; Messrs. G. Bunyard and Co., Maidstone; Messrs. H. Cannell and Sons, Swanley; Messrs. W. Cutbush and Sons, Highgate; Messrs. J. Peed and Son, West Norwood; Mr. M. Prichard, Christchurch, Messrs. R. H. Bath, Lim., Wisbech; Messrs. Barr and Sons, Covent Garden; Messrs. R. Wallace and Co., Colchester; Mr. A. M. Wilson, Spilsby; Messrs. J. Veitch and Sons (orchids).

Silver Banksian.—Mr. H. Burnett, Guernsey; Mr. W. H. Page, Hampton; Messrs. Carter, Page, and Co., London Wall; Mr. R. Gill, Falmouth; Mr. L. R. Russell, Richmond; Mr. C. F. Waters, Balcombe, Sussex Messrs. J. Veitch and Sons, Chelsea (vegetables); Mr. Day, gardener to H. S. Goodson, Esq., Putney; Mr. Mertens, Ghent.

Bronze Flora.—Messrs. Dobbie and Co., Rothesay.

Bronze Banksian.—Messrs. B. R. Cant and Sons, Colchester; Messrs. R. and G. Cuthbert, Southgate; Misses Hopkins, Shepperton Messrs. Paul and Son, Cheshunt; Mr. G. Reuthe, Keston; and Mr. C. Turner, Slough.

Royal Gardeners' Orphan Fund.

The twenty-first anniversary of the Royal Gardeners' Orphan Fund was celebrated in fine style at the Hotel Cecil, Strand, on Tuesday, May 12, when His Grace the Duke of Bedford, the president of the charity, occupied the chair, and was supported by a large number of the leading nurserymen and seedsmen, and a contingent of Covent Garden friends. Altogether there were 176 sat down to dinner, and this constitutes a record attendance, and is a happy augury for future festivals.

After dinner and the usual loyal toasts, the Chairman proposed "Continued Success to the Royal Gardeners' Orphan Fund." He spoke briefly, clearly, and very much to the point, and we could wish that other speakers on these occasions would confine their attention to the matter on hand instead of attempting oratory or a disquisition on extraneous subjects. His Grace said that the Fund was instituted for the purpose of maintaining the children of men who had been gardeners. No greater shadow could hang over a man's life than that of the care of his children after he has gone. He was sorry to find that so many who required the services of gardeners specified that there should be "no incumbrances." This was a disastrous policy in every sense, and considering the decrease in the birthrate it was a national calamity that this specification should be made. At present the Fund relieves 116 orphans, and there was ever a need for more donations and annual subscriptions. At present the expenses of the Fund were met by income from investments, so that the donations and subscriptions went directly to relieve the orphans. The Fund was economically administered, and therefore had a special claim on their consideration. No pursuit, said the Chairman, gave so great pleasure as gardening, and none at so little pain to others. The Chairman concluded with an earnest appeal on behalf of the Fund, pointing out that now it had come of age and entered upon full manhood, higher duties and a more extended sphere of usefulness opened out before it.

Mr. Edward Sherwood, the treasurer, in responding cordially thanked the President for his presence and appeal. He hoped that the enthusiasm that had so far marked the proceedings was but a prelude to a more material enthusiasm to be shown later in the evening. He hoped all had done their best to make this coming of age festival a success. He had endeavoured to canvass county friends who did not usually come within the operations of other friends of the Fund, and he had been surprised to learn how little these good people knew of the Fund and its operations. And yet it could not be too widely known that the Fund was helping orphans all over the British Isles; the Fund was in no sense metropolitan, and London was considered only as a convenient distributing centre. In commemoration of the coming of age, he wished on behalf of his father, Mr. N. N. Sherwood, V.M.H., his brother, Mr. William Sherwood, and himself, to present to the Fund a sum of money for the relief of one child, this Fund to be called, after their grandfather and niece, the Maybud Campbell Fund. Needless to say, this generous offer was enthusiastically received.

The Mayor of Westminster, Mr. J. W. Dennis, J.P., proposed, "Gardeners and Gardening," and this was responded to by Prof. J. B. Farmer, F.R.S. Mr. W. Poupart pleasantly proposed "The Visitors," and to this Mr. Arnold White responded, giving the meeting his ideas of the duty of employers to gardeners, and the duty of gardeners to their employers. His chief points were that gardeners should educate themselves, and so obtain positions that would permit them to place their children beyond the need of charity, and that employers should pay gardeners a rate of wage commensurate with the great demands made upon their skill and time.

Then followed the list of donations, headed by £250 from the chairman, £100 from Mr. Leonard Sutton, £63 from Mr. G. H. Cuthbert, £60 from Mr. G. Reynolds, £55 from Mr. J. F. McLeod, £32 from Mr. R. B. Leach, £20 from Lord Mount Stephen, £18 18s. from Mr. W. Thomas, £14 14s. from Mr. R. Hooper Pearson, and substantial sums from Messrs. Barr and Sons, Mr. T. W. Sanders, Messrs. James Veitch and Sons, Mr. H. J. Veitch, Mr. Caselton, the Thames Bank Iron Company, Messrs. Anderson and Sons, etc. The Covent Garden friends contributed together the noble sum of £260 13s. 6d., and the shilling collection instituted by Mr. Clayton, one of the promoters of the Fund, reached £229. The grand total donated and collected on this occasion was £1,385, exclusive of the Messrs. Sherwood's special contribution.

Mr. H. B. May, the genial chairman of the committee, neatly proposed the health of "The Chairman," and this was given with great enthusiasm and musical honours. His Grace briefly and suitably responded, and expressed his pleasure at having presided over such a record meeting.

The musical arrangements for the evening were admirably carried out under the direction of Mr. Turle Lee; Miss Kate Rooney, Miss Rosa Dallow, Mr. A. Heather, and Mr. Randell Jackson, all sang well, and Mr. J. Bull contributed wonderful banjo selections.

Dutch Bulb Growers' Society.

The following awards were given by the Narcissus and Mixed Bulbs Committees at the meeting of April 22:—

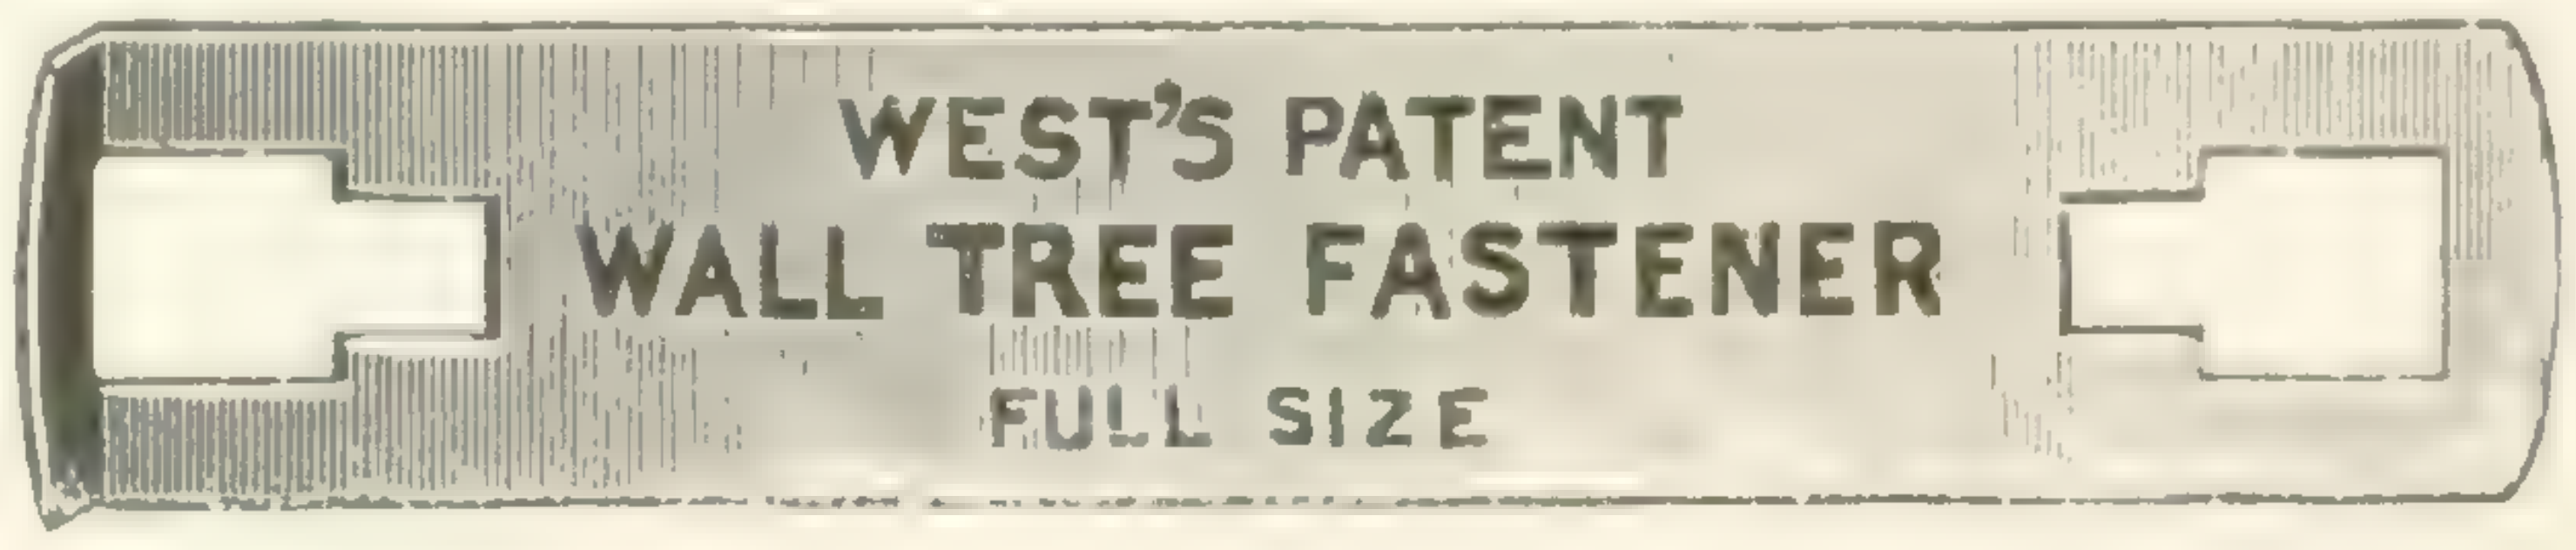
First-class certificates to Narcissus General Baden Powell, a deep yellow trumpet daffodil; Narcissus Sulpher Beauty with white perianth and clear sulphur trumpet. Narcissus bicolor Dick with white perianth and yellow trumpet; Astilbe Queen Alexandra, and Astilbe Peach Blossom, both of a handsome rosy pink colour, good forcing, free-flowering varieties.

Awards of Merit were given to Narcissus J. H. Krelage, a very early free-flowering trumpet daffodil with light yellow perianth and pure yellow trumpet; Narcissus Mr. van Noort, a cross between Emperor and Golden Spur, a large flower with broad yellow trumpet and light yellow perianth; Narcissus Sir Henry Campbell Bannerman with deep yellow trumpet and yellow perianth with rather pointed petals; N. bicolor Giant, with fine broad trumpet and cream white perianth, a large flowering, strong growing variety; N. bicolor Miss Ellen Terry, with clear yellow trumpet and white perianth; Narcissus Snow Queen, a white trumpet daffodil with curling petals; N. Tom, with dark yellow trumpet and yellow perianth, a large-flowering variety.

Cultural awards and medals were awarded to various exhibits.

TRADE NOTES.

To the numerous appliances that have been introduced by Mr. West, of Higham Hill, for the purpose of assisting amateur and professional gardeners in carrying out the many details associated with garden management must be added a patent wall-tree fastener. This new appliance is remarkable alike for its ingenuity and simplicity, and will be found extremely useful in the training of trees to wall surfaces. The patent fastener consists of a strip of aluminium, provided at each end with a graduated aperture so that when passed over the nail it is held firmly, while the free end is bent over the branch. The slot of the free end is then passed over the nail head, and the two ends of the strip folded together. As will be readily understood from this brief description and the accompanying illustration, the nail can be fixed in the wall before the patent fastener on the branch is brought into position. For this reason the patent fastener can be removed and used elsewhere if desired, without removing the nail. Mr. West has also introduced an aluminium label which has the merit of brightness and permanency. The label readily receives and retains the impression of the pen or pencil, the character of the metal contributing to the permanency of the writing.



In connection with the two articles descriptive of noteworthy gardens in and around Bristol, of which the first appears in this issue, it is of interest to mention that a considerable amount of work in the glass departments of Ashton Court and Cote House has been done by Messrs. Skinner, Board, and Co., horticultural builders, Rupert Works, Bristol. Having regard to the high reputation enjoyed by the firm we need hardly say that the buildings erected by them are equally remarkable for elegance of design, sound workmanship, and adaptability to the purposes for which they were constructed. Messrs. Skinner, Board, and Co., are, we would add, the makers of Board's Patent Wire Tension Greenhouses, which, we understand, are in big demand throughout the United Kingdom. They have already been erected in large numbers of the principal gardens as well as in those of modest dimensions, and their popularity is, we learn, increasing with both amateurs and practical gardeners.

FORTHCOMING ENGAGEMENTS.

TUESDAY, May 19.—Croydon Gardeners' Society.

WEDNESDAY, May 20.—Royal Botanic Society's Exhibition.

Royal Society of Arts.

THURSDAY, May 21.—Brighton Horticultural Society Meeting.

MONDAY, May 25.—Linnean Society Anniversary Meeting.

Kew Guild Annual Meeting and Dinner at the Holborn Restaurant.

TUESDAY, May 26.—Great Temple Show; three days.

WEDNESDAY, May 27.—Bath and West and Southern Counties Show; five days.

Hayward's Heath Gardeners' Outing to Abbotsleigh

ANSWERS TO CORRESPONDENTS.

MILDEW IN ROSES.—S. C. J., Mitcham: Under the circumstances, you cannot do better than use black flowers of sulphur, distributing it by means of a bellows early in the morning, when dew is on the foliage and the air is still.

COLARETTE DAHLIAS. — J. H. J., Hitchin: These dahlias have originated on the Continent, and are much like single dahlias with a row of highly-developed disk florets between the disk and the ray florets or petals. This ring of large florets is very interesting, as it often differs in colour from the other parts, and, by virtue of its position, it prevents the ray florets from falling quickly, and so extends the life of a flower. A few of the best of the Colarette dahlias are Grand Papa Charmet, purple and white; Duchesse Melzi d'Eril, yellow, red,and white; Merveille de Lyon, scarlet, yellow, and white; Corbeille de Feu, red and yellow; La Fusee, red and white; Pres. Viger, crimson-purple and white; Mdme. le Page Viger, scarlet and yellow; Signorina Esengrini, orange and two shades of yellow; and Comte Cheremeteff, vermilion and gold.

PROPAGATING A RARE SWEET PEA.—W. F., Chester: Not a few people have the same complaint to make, and no doubt the moist cool season of 1907, while admirable for the production of fine flowers of sweet peas, was not a good one for seed-ripening, hence so many seeds have failed to germinate. You may propagate your variety by cuttings, though this procedure should not be carried to any great length. Take cuttings of the side shoots or the apical growth three or four inches long, and insert them near the sides of the pots, in sandy soil, and place them in a close frame in a warm pit. Give shade for awhile, and under usual conditions the cuttings will be rooted in a fortnight. Then pot them singly, proceed to harden them, and plant out as soon as the plants are fairly well rooted. Plants so raised are worth a little extra attention, and if this is given them they will give a good account of themselves. It is not generally known that sweet peas may be raised from cuttings, and it is as well to point out that such propagation is likely to reduce the vigour of the sweet pea if carried out in a wholesale manner.

ADA AURANTIACA.—R. C., Barnstaple: This very beautiful and useful orchid has never, in our opinion, been cultivated as widely as its merits deserve. It comes from the Cordilleras of Colombia, and was discovered by Schlim in 1851. It is a fine cool house orchid, and you will find it thrive under the conditions found successful for odonteglossums. It sometimes flowers in autumn, but February and March may be regarded as its proper flowering time. The flowers are vivid cinnabar-red, produced in arching spikes from seven to fourteen inches long. Repot as soon as new roots commence to form.

APPLE MILDEW. — M. E. M., Isle of Wight: We cannot tell what the trouble or its cause is without specimens, but, judging from your description, the disease is Apple Tree Mildew (Sphærotheca mali), a pest that is often very prevalent in the spring time, soon after the flowers have fallen. The growth is stunted as a result of the attack, and the leaves are covered with white or greenish white powder, which arrests growth. Where the attack is a very bad one the infected growths should be cut off and burned, as then new branches will be sent out, and these will probably be clean and healthy. After such treatment in the case of badly-infected trees, and also in the case of light attacks, the trees should be sprayed with a solution of sulphide of potassium, at the rate of 1oz. of sulphide to two gallons of water. Where trees have been subject to infection previously, it is a good plan to spray with sulphide of potassium directly the leaf buds begin to expand, and to follow this with a later spraying if the disease is observed. It has been noticed that where American Blight and green-fly are prevalent in orchards and gardens, there also does Apple Tree Mildew become a pest. Whether the former distribute the fungus spores or in any other way aid the dispersion of the disease, or whether they merely reduce the energies of the plants, and thus render it liable to attacks, is not yet determined, but in any case general precautions against insect and fungus attacks should be taken, and a caustic winter dressing should always be given.

BUTTERFLY ORCHID.—L. S. E., Grantham: The descriptive title of Butterfly Orchid has been given to several species, but those that seem to have the best claim to the title are Oncidium Papilio, and O. Kramerianum, both of which, with their brilliant colouring, pose, and elongated petals and dorsal sepal, do suggest a tropical butterfly. Doubtless you are aware that Phalænopsis and the beautiful Dendrobium Phalænopsis Schroderiana are known as Moth Orchids.

SOIL FOR WINDOW BOXES.—G.R.N., Manchester: Good sound loam should form the basis of the soil for window boxes, and it is worth while going to the expense of securing good material because the plants do so much better in it. Use three parts of loam to one each of leaf-mould and decayed manure. A little coarse sand may be added if the loam is inclined to be adhesive. Add to this mixture one pint of bone-meal per bushel. Do not fill the boxes too full of soil: leave room for ample waterings, and then two or three top-dressings can be given during the season. Such top-dressing should consist of rather fine loam mixed with an approved fertiliser and spread over the surface. It is a good plan to water the boxes in the morning and apply the top-dressing in the evening, syringing the plants afterwards to clear off any soil or fertiliser that may attach to them, and also to settle the new soil.

NAMES OF PLANTS.

W. W. G., Shanklin.—Spiræa arguta.

S. S., Tewkesbury.—Magnolia stellata.

B. E. A., Swansea.—1, Rosmarinus officinalis; 2, Santolina canescens.

R. S. J., Ipswich.—1, Oncidium Marshallianum; 2, Spiræa arguta; 3, Prunus triloba.

A. Q., Retford.—1, Saxifraga Rhei; 2, Primula frondosa; 3, Sonerila Hendersoni; 4, Clematis indivisa lobata.

L. M., Leicester.—1, Epigæa repens; 2, Sagina procumbens; 3, Dendrobium Falconeri; 4, D. Devonianum.

T. T., Oswestry.—1, Adonis vernalis; 2, Doronicum Harpur Crewe; 3, Abies nobilis; 4, Myrsiphyllum asparagoides.

G. S. W., Welwyn: 1, Asplenium biforme; 2, A. bulbiferum; 3, Adiantum fissum; 4, Davallia polyantha; 5, Nephrolepis Duffii.

U. T. W., Bedale.—1, Fuchsia triphylla; 2, Nertera depressa; 3, a species of Marsilea; 4, a schizanthus of the Wisetonensis type.

O. E., Guernsey.—1, Pittosporum Tobira; 2, Lotus peliorhynca; 3, Desfontainea spinosa; 4, Clianthus puniceus; 5, Acacia lophantha; 6, Acacia Riceana.

F. B. C., Cheltenham.—1, Odontoglossum crispum, a very poor, weedy form, and one not worth cultivating when others of great beauty can be obtained so cheaply; 2, O. crispum, a good type of flower, but the flowers are set too loosely on the spike; 3, Masdevallia Chimæra; 4, M. Harryana.

I., Hants.—We do not undertake to name florists' flowers, and you have rendered it practically impossible for us to do so by cramming flowers into a small box in wet moss. Further, not a single specimen was numbered. The broad variety is evidently Barri conspicuus, the white one Narcissus poeticus, the double yellow is Yellow Phœnix, and the other double is Butter and Eggs, while the trumpet variety is probably Horsfieldi.

OBITUARY.

◆

MR. BERNARD COWAN.

We regret having to record the death of Mr. Bernard Cowan, superintendent of the South Shields Cemetery, a position he has occupied during the past twenty-seven years. Mr. Cowan was the descendent of an old Irish family, and, after serving an apprenticeship in a north country garden, and occupying positions in the gardens of Hesleyside and Gibside Hall, he was in 1874 appointed head gardener at Axwell Park, the residence of Sir Henry Clavering. In 1880 Mr. Cowan was appointed to the position, for which there were 108 candidates, of superintendent of the South Shields Cemetery, which has long been known as one of the most beautiful cemeteries in the north of England. The duty of laying out the cemetery devolved upon Mr. Cowan, and in the accomplishment of this task, he displayed remarkable taste and judgment. Imbued with the idea that "God's Acre" should be made as beautiful as possible, Mr. Cowan utilised with exceptional taste the trees and shrubs that thrive in such exposed positions as that occupied by the cemetery, both on the boundaries and alongside the principal walks, and he has annually arranged attractive displays of flowers during the spring and summer months. Mr. Cowan was the senior vice-president of the English Arboricultural Society, and for many years the hon. secretary of the South Shields Chrysanthemum Society.

Situations Wanted.

GROWER or as HEAD GARDENER.—A. WILLIAMS, for the last 7 years and 3 months Foreman Grower of Lane and Sons' famous Vines and Figs is open to a Re-engagement, or Head Gardener where five or more are kept; of large and varied experience in all Horticultural matters. WILLIAMS, Park Street, Berkhamsted, Herts.

A LADY wishes to thoroughly recommend her HEAD WORKING GARDENER, where three or more are kept; life experience in all branches; splendid fruit grower; six years' excellent character; left, as establishment is reduced owing to death; age 39, married; no children at home. Apply to F. FOLLY, Sutton Courtenay, Abingdon, Berks.

GARDENER (Head Working), where two or more are kept; middle-aged; life experience Inside and Out; **hard working; good references from** last and previous employers. G. BURGESS, 17, Eversleigh Road, Lavender Hill, London, S.W.

GARDENER (Head Working).—F. SMITH seeks SITUATION with any Lady or Gentleman requiring a thorough all-round Gardener; first-class references; life experience; age 45; married, no family. Address Rose Cottage, Mellis, Suffolk.

GARDENER (Head Working), age 31, married; life experience in good places, including Syon House, Mereworth Castle, and Old Warden Park; **3½ years as Head; highest references.** F. FRENCH, Covent Garden, Barming, Kent.

GARDENER (Head Working), life experience with glass, flowers, kitchen garden, and orchids; good character; married. W., 32, Eleanor Road, Bowes Park, N.

GARDENER (Head Working or good single-handed); age 40; married, no family; experienced in all branches; good reference. Apply E., 45, Beulah Road, Thornton Heath, Surrey.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of vines, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head Working).—Mr. F. STRONG would be pleased to highly recommend H. DOWELL, as a thorough practical Man, to any lady or gentleman requiring such; life experience; abstainer; **age 27. High Grove, Pinner.**

GARDENER (Head Working), where three or more are kept.—A gentleman, reducing his establishment, can highly RECOMMEND his HEAD GARDENER as thoroughly trustworthy and experienced in all branches; strong, energetic; married, [illegible] 15. "P.," West Cottage, Broomfield Lodge, [illegible]

GARDENER (Head Working); experienced in Vines, Peaches, Plants, Outside Fruits, and Vegetables; good testimonials; age 40; married, one child. F. BEARDALL, 54, Charlton Street, Maidstone.

GARDENER (Head Working), thoroughly experienced in all branches, Inside and Out; early and late forcing; good references; age 38; married, no family. R. GRIFFITHS, Rose Acre, Bearsted, Maidstone.

AS GARDENER (Single-handed, or with help), life experience (Inside and Out); can be well recommended from last place; also good previous references; age 44, single. F. GOWERS, Broad Green, Gt. Waltham, Chelmsford, Essex.

GARDENER wants SITUATION; Single-handed; 3½ years in present situation; married. A. STEVENS, 179, Beechcroft Road, Upper Tooting.

50,000 APPLES ON PARADISE
TRAINED TREES A SPECIALITY.
CATALOGUE FROM J. R. PEARSON & SONS.
LOWDHAM, NOTTS.

ROSE 'BABY DOROTHY.'

Good Plants in Pots, **2/6** each, **24**/- doz.

'AZALEA ROSÆFLORA,'

The quite hardy lovely salmon-pink variety. Price **3/6** and **5**/- each.

OUR TEMPLE EXHIBIT

Comprises a fine lot of

PERPETUAL FLOWERING CARNATIONS.

Prices range from **6**/- doz. Also

MALMAISONS,

Grand Plants, just opening, from **18**/-. doz. An important feature will also be a wonderful lot of

CLIMBING ROSES FOR ARCHES & PERGOLAS and the **METROSIDEROS FLORIBUNDA**, "The Bottle Brush or Flaming Bush of Australia."

HUGH LOW & CO., —— Royal Nurseries —— **BUSH HILL PARK, Middlesex.**

DAHLIAS, Our Speciality for 50 Years.

Catalogues giving Cultural Hints, gratis.

KEYNES, WILLIAMS & CO.,
DAHLIA GROWERS, **SALISBURY.**

WARE'S

GOOD ONLY

DAHLIAS.

4 Gold Medals Awarded in 1907.

CACTUS, and all other sections, from **6d.** each; **5**/- doz.

NEW PÆONY-FLOWERED VARIETIES, 9d. each; **7/6** doz.

OUR SPECIAL COLLECTION OF CACTUS VARIETIES, 12 distinct and choice sorts, out of pots, post free, **5**/-.

BEDDING PLANTS

of all descriptions and in great variety.

CANNAS, orchid-flowering, **5**/- doz.
,, mixed, unnamed, **3**/- doz,
CHRYSANTHEMUMS, choice, for cutting, **3**/- doz.
PENTSTEMONS, fine varieties, **5**/- doz.
GERANIUMS, FUCHSIAS, etc., the best, all at usual prices.

Choice Strains of **STOCKS, ASTERS**, and other **SEEDLINGS**, all strong well grown sturdy plants.

Catalogue Free by Post. Address "Dept. No. 2."

THOMAS S. WARE ('02), Ltd.,
FELTHAM.

PLANT NOW.

WATER LILIES

Full particulars of best and newest varieties. Post free.

DICKSONS, Nurseries, CHESTER.

FUCHSIAS.

GRAND HYBRIDS FROM TRIPHYLLA, one of the best modern plants, one plant each of eight best kinds, **4**/-.

FUCHSIAS, 12 best single varieties, named, **3**/-.
,, 12 best double varieties, including Sylvia, finest double white, **3**/-.

ZONAL GERANIUMS.

12 splendid varieties, named, **4**/-.

DECORATIVE PELARGONIUMS,

12 splendid varieties, named, **6**/-.

BEGONIAS TUBEROUS.

Finest single for pots. One each 12 distinct colours; large round flowers, erect flower stalks, for **4**/-. All colours, mixed, 12 for **3**/-.

The above are not scraps, but good strong plants, free for cash with order only.

SAFE **GARDO** SURE

AN INVALUABLE INSECTICIDE FOR GREENHOUSE & GARDEN.

Gardo is effectual for all kinds of Aphis and other insect pests. It is non-poisonous, soluble in water and, if used according to instructions, does not discolour or leave any visible film on the foliage or flowers.

Gardo is used by some of the best amateurs and largest members of the trade at home and abroad. Sold in Tins: **1/-, 1/6, 2/6** & **4/-** each. Drums: 1 gall. **7/6**; 2 gall. **13/6**; 5 gall. **30/-** each, by Seedsmen, or sent direct from Ipswich on receipt of P.O.

Send a post card for full particulars and directions for use to

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Germs.

It is a curious exemplification of the old proverb that "Familiarity breeds contempt," that the ubiquitous nature of germs of innumerable kinds in the food we eat, the air we breathe, and the water we drink should trouble us so little. Another old proverb, that what cannot be cured must be endured, comes in as a sort of mitigant, and it is well that it should be so, since otherwise life would not be worth living. Fortunately, too, we know that the vast majority of these germs are entirely innocuous, so far as we are concerned, their habitats are outside the human organism, and their destructive powers find outlet elsewhere in directions which do not immediately concern us, although in many cases they certainly do so indirectly. It is due to some of these germs that no sooner does vitality depart from an organism, animal or vegetable, than their materials are seized upon, reutilised, and put, as it were, again into circulation. Every dead leaf, for instance, so soon as it reaches the soil, becomes the prey of a host of fungoid and insect destroyers, which break it up, and reconvert it into material readily assimilable again by fresh vegetation. Death and decay are thus seen to be terms involving mere translation into other forms of life in the endless round of vital transformation, while without these germs the world would become encumbered with ever-increasing masses of inert dead matter. A good deal of such transformation work is undoubtedly effected by the larger forms of life, cattle devour the grass, and we devour the cattle; carnivora of innumerable kinds, insect and animal, prey upon the vegetarians, but few of these can or do feed upon already dead material; hay and similar dried vegetation is dead, it is true, in one sense, but it is only edible by virtue of artificial preservation of its nutrient qualities by man, left to the elements after cutting, no cattle would touch it. Germs of all kinds constitute one of those subtle vital arrangements by which Nature is constantly restoring the balance, and even those deadly ones which carry disease in their train, must, when broadly viewed, be regarded as beneficent factors in the scheme of creation by indicating to us some breaches of Nature's laws which we have ourselves committed through our ignorance or neglect, and thus by forcing us as a matter of self-preservation to take proper sanitary measures, the condition of humanity step by step is raised to ever higher levels. Looking back to the time of the great plague, we can now clearly see that it was due to insanitary conditions, and the immensely improved position of London and other great cities is thus seen to be largely the outcome of the efforts of these deadly germs to enforce the needful lesson. One by one we are now solving the secrets of the life histories of such, and thus learning how to baffle their attacks, but the more we learn the better we know that immunity can only be maintained by constant vigilance, and so we are kept up to the mark. We live, as it were, in a citadel which is ever being besieged by countless hordes of foes, but we are beginning to learn that the innumerable hosts have their internecine struggles, which resolve many of them into allies. Most of these germ foes are incapable of effective attack unless the way be already prepared for them. The gardener, for instance, knows perfectly well that if by judicious ventilation and treatment generally he can induce robust growth, the plant will be immune from many pests and diseases. Most of the prevalent diseases and ailments, whether in the lives of man or plant, may be traced to some neglect of natural laws which has weakened the powers of resistance to the all-pervading germ. As we have said, however, there are germs and germs. Who until recent years would have dreamt of the soil being pervaded by busy hordes of living bacteria, one kind of which, in one direction, may stimulate the orchid seed to germinate, feeding it in some mysterious way like a foster mother until it can run alone, while in another direction another kind may double and treble our crops of the pea tribe and associated plants by its symbiotic presence in the roots. The first great fruits of the germ theory was the discovery and application of germicides, i.e., antiseptics, a discovery which transformed our hospitals from death traps into means of salvation. The next was that of a power of attenuating their virus by anticipation, i.e., vaccination, and now by their continued study we are finding out the other side of germ history and discovering our friends among the foes.

MR. CHARLES T. DRUERY, V.M.H., F.L.S.

Mr. Charles T. Druery, V.M.H., F.L.S., has, during the past seventeen or eighteen years, contributed so freely to these pages of his remarkable knowledge of

British ferns and some other subjects, that we feel sure our readers will welcome the portrait which we have the pleasure of giving in this issue. Throughout this comparatively long period Mr. Druery has, through these pages, persistently kept the claims of the choice varietal forms of our native ferns before plant lovers, and he, with us, has the satisfaction of knowing that as the result of the attention given to these exquisitely beautiful plants, in the pages of the Gardeners' Magazine, they are once more rapidly acquiring popularity. Mr. Druery has been successful in obtaining several good "finds," as well as in cultivating British ferns, and advocating the claims they have upon those who are interested in hardy plants. After some years' study, and making a small collection of choice varieties, Mr. Druery obtained his first fern "find" in 1881, this being Blechnum concinnum Druery. Two years later, as the result of close observation in the study of his favourites, he discovered apospory, until then a quite unknown form of reproduction in ferns. This Mr. Druery subsequently discovered in five, or including Cystopteris montana, in six British species. In 1885 he was elected a Fellow of the Linnean Society, and in 1897, due presumably to these original discoveries, received the distinction of the Victoria Medal of Honour in Horticulture from the Royal Horticultural Society. Both in selective culture of ferns and discoveries of wild sports, Mr. Druery has been peculiarly fortunate. Two quite new and unique strains of athyrium and polystichum originated in his fernery, and among the beautiful wild sports he was successful in finding were Athyrium filix-fœmina cristata Kilrushense, Lastrea montana cristata gracile, and L. m. plumosa Druery. In addition to his contributions to the Gardeners' Magazine Mr. Druery has written two books on British ferns, the first "Choice British Ferns," and the second, "The Book of British Ferns," and he has also written several books in a lighter vein, notably "The New Gulliver."

Spraying for Apple Psylla.—Mr. Spencer Pickering, F.R.S., writes from Woburn: As there is still time for growers to spray their trees for this pest, they may be interested to know that the results obtained by the use of tobacco at Woburn have been as satisfactory this year as they were last year. The liquid used on this occasion was a 7.5 per cent. solution of nicotine, obtained from Messrs. W. Voss and Co., Glengall Road, Millwall, which was diluted with 100, 75, and 50 times its volume of water in the various experiments. Standard trees were sprayed with the two weaker of these on the morning of May 7, and in both cases 95 per cent. of the psylla were killed. The stronger solution was not used till the afternoon of the same day, and the results were not so good, the mortality being only 60 per cent. This was due to the fact that rain fell for an hour and a-half later in the same afternoon. Various other insecticides which were applied at the same time as these nicotine solutions proved comparatively ineffective.

The Season of the Bluebell (Scilla nutans) is so well known to be coincident with the "merrie month of May" that we shou'd not refer to it, were it not that we are anxious to again call attention to the great value of the flower for beautifying the less highly-dressed parts of the pleasure grounds and woodland walks at this season of the year. Bluebells are to be met with in all parts of the country, and object lessons on the best means of utilising them in the garden are not difficult to obtain by those who have access to woodlands in the more rural parts of England. There are, however, no object lessons of greater value than those to be found in the Royal Gardens, Kew, and they have the advantage that they are accessible to all who are resident within a convenient distance, or are able to make a journey thither. In the grounds of the Queen's College, and in other parts of the Royal Gardens, the bluebells are now in perfection, and, with the mind full of the charming pictures they have produced, it is difficult to regard them from a practical point of view, and write about object or other lessons. It is still more difficult to convey anything approaching an adequate idea of the exquisite beauty of the effects produced by the myriads of their elegant blue flowers. In the Gardeners' Magazine of April 4 we gave an illustration of the bluebells in the woodland glade to the south of the Queen's Cottage, but, delightful as was this in composition and perfect in detail, it failed to realise otherwise than imperfectly the poetic charm, to quote from Shelley, of

> "Tender bluebells at whose birth
> The sod scarce heaved."

or as even more exquisitely expressd by Tennyson, of

> Sheets of hyacinth
> That seemed the heavens upbreaking through the earth.

We advise those of our readers who can do so to visit the gardens during the next few days, and make a point of seeing the bluebells.

Spring-flowering Bulbs at Birmingham.—The arrangements of spring-flowering bulbs in the Birmingham public parks have been on the same liberal scale as for some years past, and they have throughout been remarkable for the taste shown by Mr. Morter, the superintendent, in carrying them out. The principal display was in Cannon Hill Park, but all the parks were so liberally embellished as to afford abundant entertainment for visitors. As evidence of the extent of the several displays it may be mentioned that of the bulbs used, there were 250,000 daffodils, 80,000 tulips, and 15,000 hyacinths, 7,500 of the last-named bulbs being planted in Cannon Hill Park.

Kew Guild Dinner.—At the annual dinner of the Kew Guild, to be held in the Venetian Chamber of the Holborn Restaurant at 7.30 p.m. on Monday, May 25, Mr. William Pettigrew, superintendent of the Cardiff parks, will preside. A number of Colonial and Indian members will be present, including Messrs. G. Cave (Darjeeling), E. W. Davy (Nyassaland), R. Derry (Singapore), A. E. Evans (Gold Coast), and G. T. Lane (Calcutta). The annual general meeting of the Guild will be held on the same evening at 6.30 o'clock in a room adjoining the Venetian Chamber.

The Temple Show, which will be held on Tuesday, Wednesday, and Thursday next, has the promise of proving at least equal to the best of the many magnificent exhibitions that have been held in the historic gardens of the Inner Temple. We shall give in our next issue a full report, with numerous illustrations, of this great gathering.

Interesting Primulas.—At the recent meeting of the R.H.S. Scientific Committee Mr. James Douglas, V.M.H., showed, on behalf of the Right Hon. the Earl of Waldegrave, some flowers of the green primrose, in which the corolla is virescent and the stamens are but imperfectly formed. Rev. A. R. Upcher, M.A., of Halesworth, Suffolk, showed a large number of flowers of polyanthus of large size and much substance, and many with a very distinct eye. The calyx was large and very broadly campanulate in most of the flowers. Mr. Upcher had started some thirty years since with the old "butter" polyanthus, and had pollinated this with pollen from Primula sinensis and P. auricula; but although considerable variation in many directions was observable in the flowers shown, the committee did not consider that there was any evidence that the pollen of these species had had any effect in producing the results obtained. Some of the forms had fringed petals, some smooth-edged, the petals in some were remarkably broad, the "eye" was well marked, and contrasted with the remainder of the corolla in some, while in others the deep colour was suffused over the whole of the petals. The collection showed in a marked manner the variation obtainable in polyanthus through cultivation without the introduction of new blood. Mr. Bowles showed a number of flowers of P. officinalis from a wild source lacking the deep yellow spot which is usually to be found in the flowers of this species. He asked that others would make observations in order to note whether this was a common phenomenon or not.

The Horse Chestnut Trees are, as we write, in the first flush of their floral beauty. At Kew, at Hampton Court, and in the world-renowned avenue at Bushey Park, the trees are now a beautiful sight, and if the fine weather continue, no doubt many thousands of people will visit Bushey Park on Saturday and Sunday, May 23 and 24, to see the noble trees carrying myriads of erect spikes of handsome flowers. Lilacs and laburnums are also very beautiful just now.

Early Raspberries. — The first consignment of raspberries reached Covent Garden this season on May 17, and were sold on May 18 at 10s. per lb. These had been ripened under glass, and the fruits being very fine they were quickly purchased by those who love to have the "first" fruits, and are ever looking for something wherewith to startle their guests.

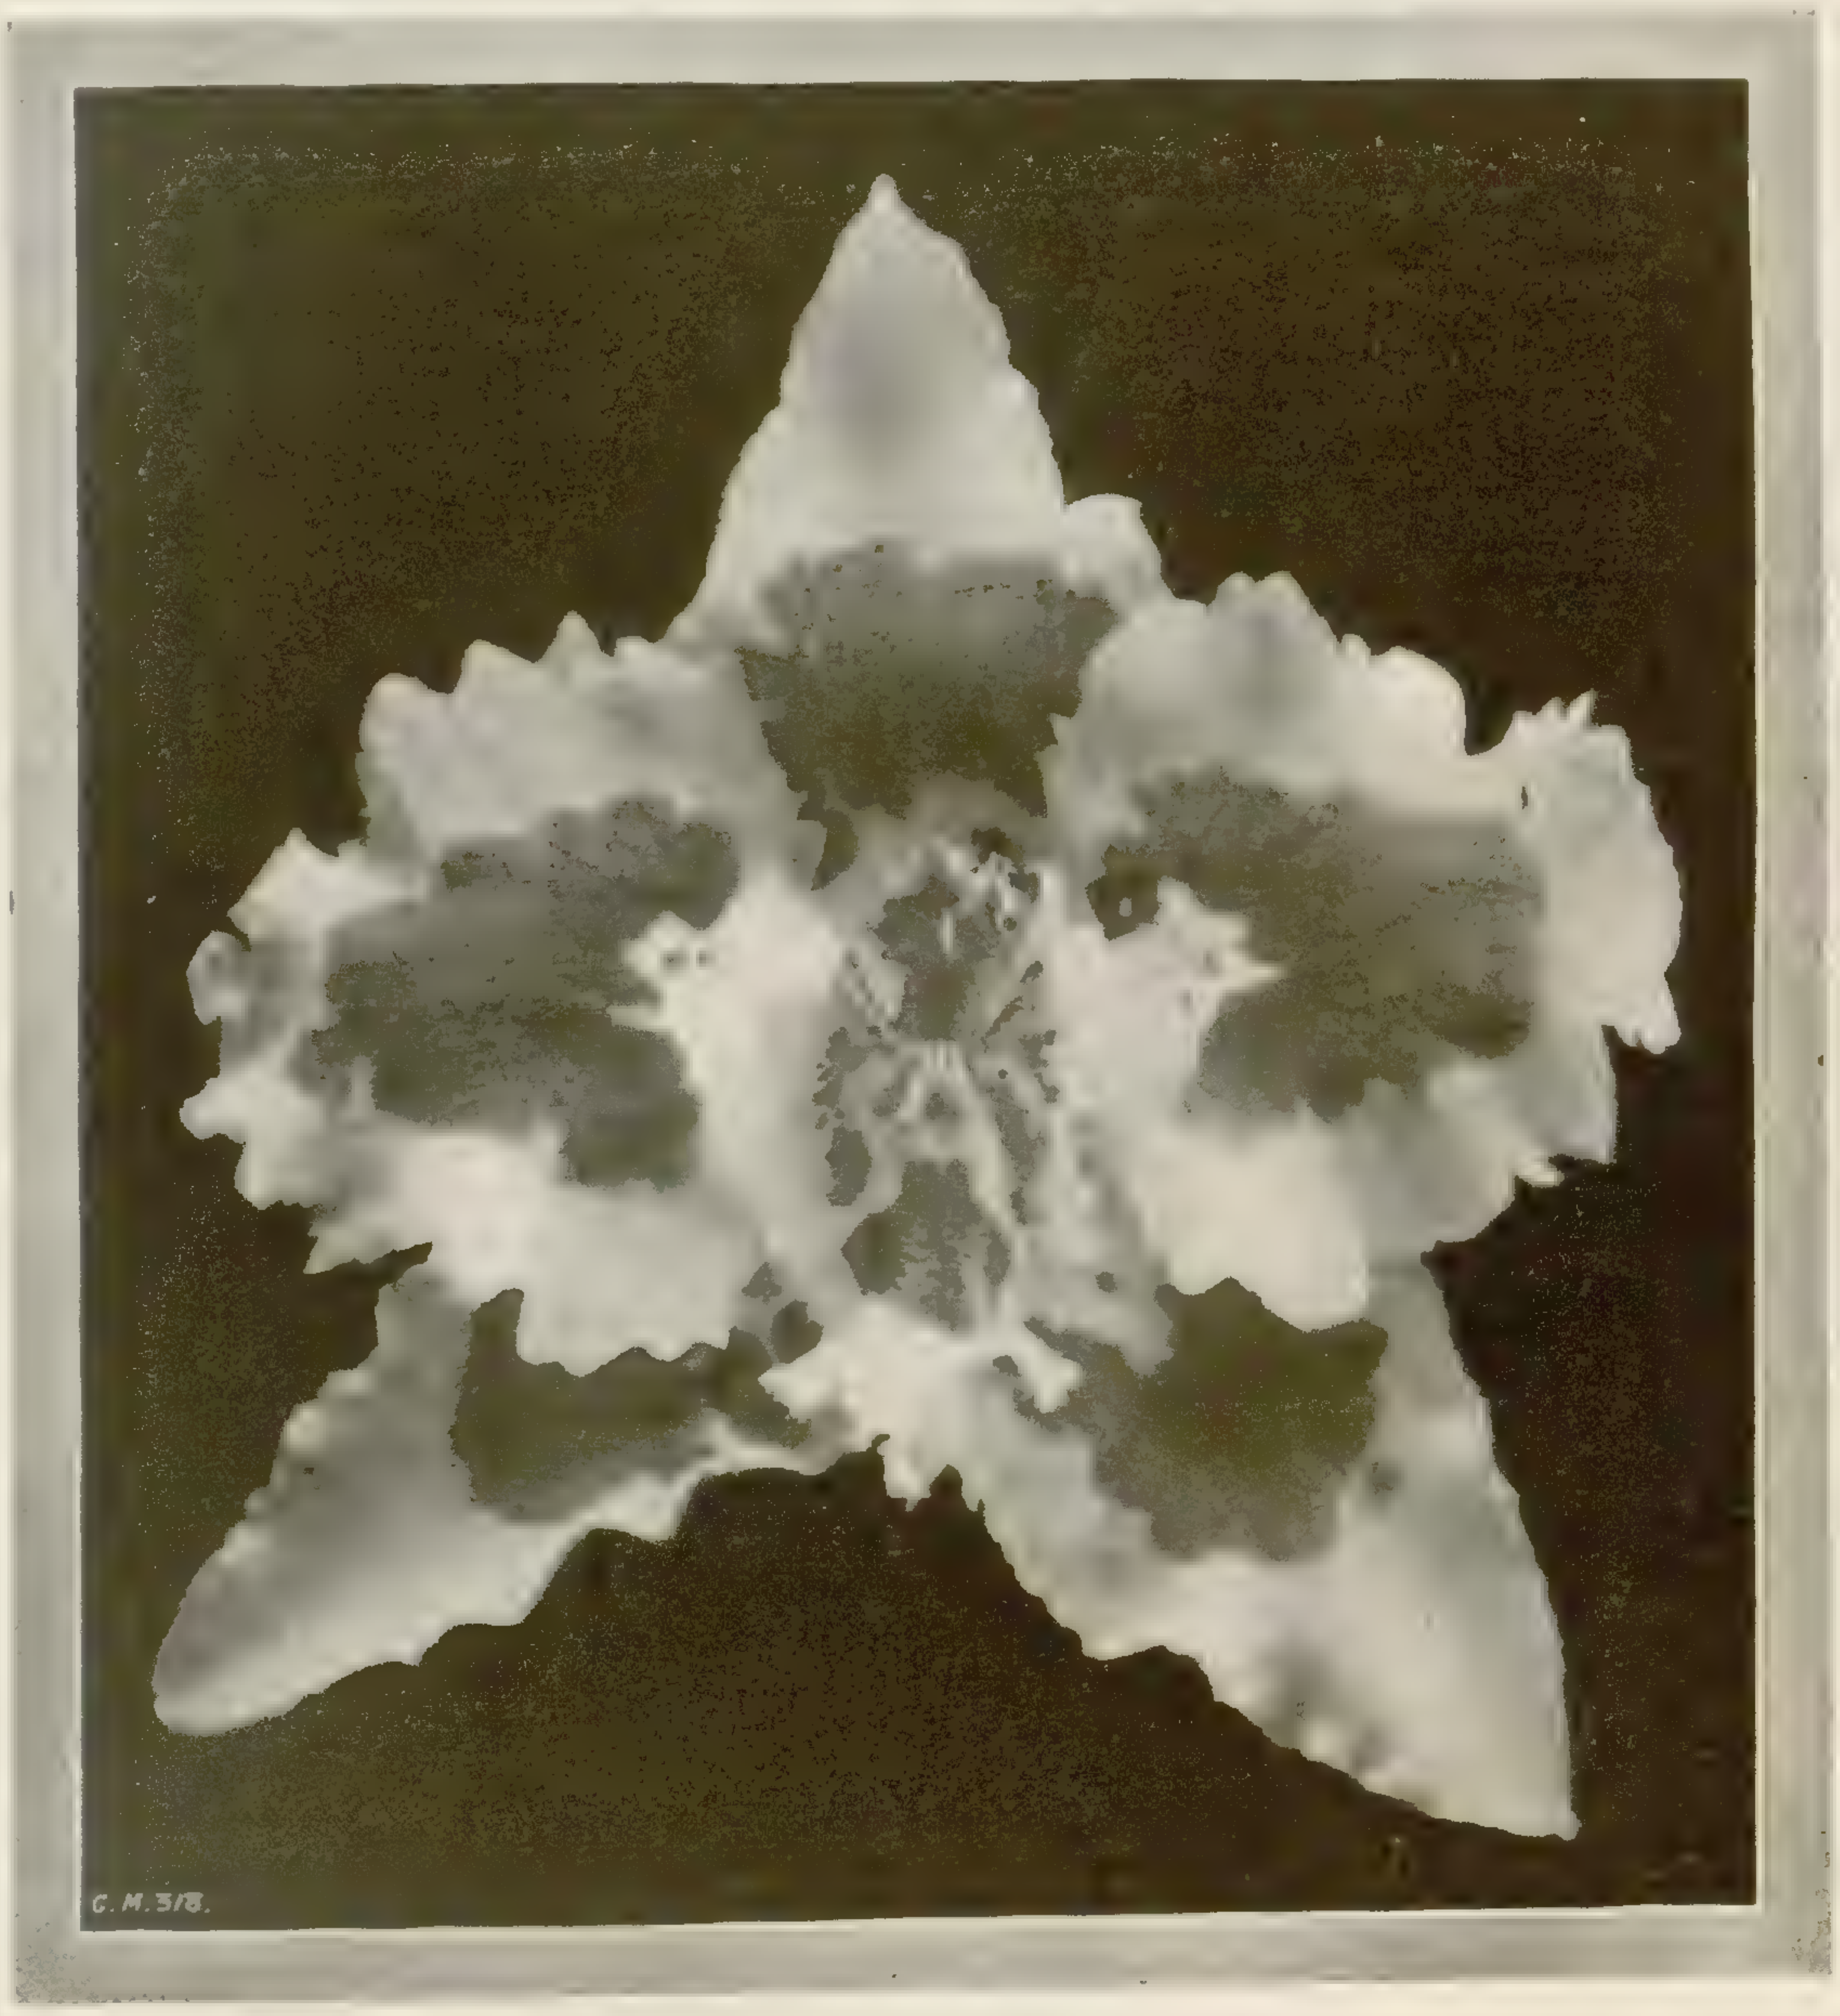
Franco-British Exhibition. — This exhibition, which is being held at Shepherd's Bush, was opened on Thursday, the 16th inst., by the Prince and Princess of Wales. Although it rained more or less heavily throughout the day there was a large attendance, upwards of 123,000 persons passing the turnstiles. Owing to the magnitude of the task much remained to be done on the opening day, but rapid progress has been made with the work of completion during the past week. In the large flower beds to the right and left of the main avenue and adjacent to the Palace of Music, Messrs. Sutton and Sons have made an extremely beautiful display, which is of special interest as an illustration of what flowers can be grown from seed within a short period. Messrs. Sutton and Sons have supplied the grass seeds required by the exhibition authorities. Messrs. James Carter and Co., of High Holborn, have a bold and effective group of flowers, shrubs and palms in the centre of the garden in the Court of Arts. The Messrs. Carter are laying out the gardens and lawns of the Royal Pavilion, the Indian Pavilion, and the Canadian Pavilion, in which more than a million bedding plants will be utilised.

The Sweet Pea in France.—Mr. G. D. Clark, of Dover, is one of the few English horticulturists who can be congratulated on having written a work in the French language. His recent production, "Les pois de Senteur," is a neat little treatise of about 32 pages, dealing with the history and culture of the sweet pea in a succinct form for the benefit of our neighbours on the other side of the Channel. Popular as the flower is here and in America, it has not yet been much grown in France, and the object of the pamphlet is to familiarise French flower lovers with its culture. The treatise contains several illustrations, and a list of varieties, besides the cultural matter.

Black Scab in Potatoes.—The National Fruit Growers' Federation have taken the potato under their care, and, as the result of their activities, a conference was the other day held at the offices of the Board of Agriculture. The points suggested by the Federation for discussion were as follows: (1) That the "black scab" of potatoes be made a notifiable disease under the Destructive Insects and Pests Act, 1907, with the object of enabling the Board of Agriculture to ascertain at once the exact areas at present affected. (2) That where the disease is known to exist on any farm or holding it shall be illegal for the grower to sell any potatoes until the same shall have been examined by an inspector from the Board of Agriculture or duly qualified person; and that all potatoes found to be diseased shall be destroyed, the grower to be compensated for the same up to half their value, such compensation to be paid from the Treasury funds. (3) That the Board of Agriculture be requested either to publish the scientific details of the investigations on which the following statement (published in the Board's leaflet) is based—viz., that the black scab of potatoes is able to attack mangel and beet, or to withdraw this statement and to substitute the scientific name Chrysophlyctis endobiotica for that of Œdomyces leproides (the beetroot disease) at present used by the Board, and in the latter case to place no restrictions upon the growing of mangel or beet on land contaminated with the black scab disease of potatoes. (4) That in view of certain statements that have been made, the Board of Agriculture be requested to investigate as to whether the disease is being introduced into this country by means of imported seed. The Board agreed to the suggestion in No. 1, and will, it is understood, immediately schedule this disease, and also agreed to No. 3, and are withdrawing the leaflet in question. The suggestions for the examination and restriction of sale of diseased crops, etc., contained in No. 2 were favourably received, and will probably be adopted, or in any case there will be restrictions upon similar lines. The suggestion in No. 4 will be adopted by the Board.

Possible Introduction of San Jose Scale.—At a conference held at University College under the auspices of the Association of Economic Biologists, Mr. Walter E. Collinge directed attention to the possibility and danger of the introduction of the San Jose scale into this country. In the course of his remarks he said that this scale was a most dangerous insect pest which would, if introduced into England, be capable of endangering the fruit-growers' interest. The insects were rapid breeders, and were capable of adapting themselves to any climate. He expressed a very strong hope that the eggs on fruit and fruit bearing twigs would not be introduced into this country. He had seen the insect alive on pears purchased in Birmingham fruit-markets, and unless stringent steps were taken it would be introduced here, and once here it would be a great pest to horticulture. In the course of the discussion that followed there was a strong expression of opinion that care should be taken to prevent importation of harmful insects with foreign fruits.

Colouring Matter of Flowers.—To a recent issue of "Nature" Dr. H. C. Sorby, F.R.S., contributes a highly scientific article on "The Colouring Matters of Flowers," and it is one of special interest to those who make a study of this subject. Dr. Sorby shows that there is a great variety of colours in cultivated plants. In many cases, he states, this is easily explained, because we can see that two pigments exist, either alone or mixed in various proportions, one frequently being a yellow insoluble in water, and the other a blue or red soluble in it. As an example, he refers to the common wallflower of our gardens (Calendula vulgaris), which is sometimes a clear yellow, sometimes a sort of crimson, but more commonly a crimson-brown. The yellow is a xanthophyl soluble in carbon bisulphide; the crimson is a pigment soluble in water; the common colour is a mixture of these two, and gives the same spectrum as a yellow and a purple petal combined. We have a similar case in chrysanthemums and various other flowers. The common garden marigold is sometimes a pure yellow and sometimes a true orange or an intermediate tint, which is due to two different pigments alone or variously mixed. One or other of these may occur separately in different parts of the same flower in some plants.



ODONTOGLOSSUM CRISPUM LEONARD PERFECT.

Gold Medal and First Class Certificate, R.H.S., May 12, when shown by Norman Cookson, Esq. Flowers white, marked with bright brownish-red.

BRITISH FERNS.

The magnificent exhibition of British ferns, in a multitude of beautiful varietal forms, for which Messrs. H. B. May and Sons deservedly received a gold medal on Tuesday, the 12th inst., at the R.H.S. Hall, constituted practically the first display of any note since the Fern Conference of 1891.

At that time the trade took little or no interest in these beautiful native plants, and their culture was consequently almost exclusively confined to those amateurs who made a speciality of them, some devoting their attention to search among the wild forms for the fresh "sports" which form the basis of the cult, while others, in addition to this, added largely to the existing collections by selective culture through the spores. To this latter branch of study we owe a number of the very finest dissected and plumose types, but it is noteworthy that in every case these have been derived from wild finds showing the decomposite character, more or less markedly in their frondage, as distinct from the less divided normal ones whence they had sported. The result of this has been really marvellous, especially in the polystichums or Shield Ferns, the athyriums or Lady Ferns, and the scolopendrium or Harts-tongue, in which last the diversity of form in the fronds is peculiarly astounding when we consider the normal simplicity of the plain, undivided, pointed strap-like foliage.

This latter species indeed embraced the great majority of the varieties shown, and to the experienced cultivator of hardy ferns, the vigorous growth and consequent full development of type appealed as evidence of the most skilful culture possible. Another element of surprise was that fully-developed plants could be exhibited so early in the season, since hardy ferns, like many other hardy plants, resent forcing, and to hasten growth, as has been done in this case, involves very judicious handling to be healthily effective, as was undoubtedly the case in all the specimens shown.

Among the most noteworthy plants were two varieties of the common bracken (Pteris aquilina), one of P. a. congesta has thick, leathery, densely congested fronds, with the divisions prettily crisped and curled, a very beautiful and rare form originally found in Westmoreland, and the other, also found in that district, was P. a. glomerata, certainly one of the most extraordinary sports ever found. In this, although the fronds rise fairly stiffly and erectly, all the divisions and sub-divisions twist themselves into dense knots, the main divisions bearing large round knobs on their terminals, and the secondary ones lapping themselves tightly round the stalks. It was found on a hillside not far from Kendal, and, as the finder remarked, looked in the distance like so many huge bunches of grapes hanging down the slope. The curious part of the story is that no one has been able to find the place again.

The polystichums were in very fine form, the plumose and tripinnate sections especially, as were also some of the plumose and crested Lady Ferns of the now well-known "superbum" class, which originated in the writer's fernery. Blechnum spicant, the Hard Fern, was represented by some half-dozen of the best varieties, but fully-grown specimens have yet to be acquired.

A recent visit to Messrs. May's nurseries at Edmonton, was well rewarded by the sight of many thousands of native ferns being grown for the market, house after house, frame after frame, being filled with robust, healthy, and, above all, perfectly clean plants, while thousands of the tougher varieties were planted out in the open for development. One feature which struck me was the general correctness of the names, a point which in many instances presents insuperable difficulties, and even to the expert is often puzzling, owing to the necessary retention of old names for well-known varieties, which names are not infrequently very misleading. The principle adopted here, however, is, as far as possible, to give a really descriptive name, which then cannot be reasonably challenged.

Apart from the thousands of established plants, a peep into one of the propagating houses showed literally millions in the making, ranging from the just sown and invisible spores, through others with a dense coating of green prothalli, representing the first stage of spore germination, and on to wooden boxes by the hundred, into which these incipient growths are pricked out, and in which the infant ferns are pushing up their tiny first fronds by the myriad. Thence they are transferred, stage by stage, to isolation boxes, thumb pots and larger pots, until at last a tiny pinch of spores, much less than the equivalent of a pinch of snuff, but otherwise exactly like it, demands a hundred feet house for the accommodation of the resulting crop.

Chas. T. Druery, V.M.H., F.L.S.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM CRISPUM LEONARD PERFECT.

A wondrously handsome and finely-marked odontoglossum, one of the largest and one of the finest blotched forms of this variable species. The segments are all broad, making up a flower well over four inches across; the ground colour is white, and the heavy markings are of a rich brown-red or bronze-red colour. The margins of the segments are fringed, and the lip has a yellow crest. The whole spike shown carried fourteen flowers, but these were so closely set on the spike that they overlapped each other. Our illustration does not represent an artist's idea of the variety, but is a reproduction from a photograph taken by Mr. H. J. Chapman. F.C.C. and Gold Medal, R.H.S., May 12. Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakfield, Wylam-on-Tyne.

ODONTOGLOSSUM WILCKEANUM SCHRODERIANUM.

A magnificent variety, the plant exhibited carrying a splendid spike of large fringed flowers. The colour is soft yellow, with heavy blotches of deep crimson-red. F.C.C., R.H.S., May 12. Mr. H. Ballantine, gardener to Baron Schroder, The Dell, Egham.

BRASSO-CATTLEYA HEATONENSIS WESTONBIRT VAR.

This beautiful hybrid is the result of crossing Brassavola Digbyana with Cattleya Hardyana. The shape of the flower and the exquisite fringing of the lip are similar to those found in most of the large Brasso-cattleya hybrids, but the colour in this variety is soft buff yellow, overlaid with silvery rose. The lip has a central greenish yellow area. F.C.C., R.H.S., May 12. Mr. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

CATTLEYA MOSSIÆ GOOSENSIANA.

A remarkably beautiful member of the white group of C. Mossiæ varieties. It has fine flowers, of good form, in which the sepals and petals are all white, while a white margin surrounds the bright violet-purple area of the lip. F.C.C., R.H.S., May 12. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

ANGRÆCUM GERMINYANUM.

A dwarf species, but not an especially attractive one. The long narrow sepals and petals are greenish white, but the more effective three-lobed lip is white. A.M., R.H.S., May 12. Sir Trevor Lawrence, Bart., Dorking.

ODONTOGLOSSUM ILLUSTRE THEODORA.

A handsome orchid derived from O. Vuylsteki and O. ardentissimum. The flowers are of medium size, and of a rosy heliotrope shade, edged with white. The lip is brownish or bronze. A.M., R.H.S., May 12. Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks.

ODONTOGLOSSUM OSSULSTONI GLEBELANDS VAR.

One of the largest of its small group; it is derived from O. Pescatorei Charlesworthi and O. crispo-Harryanum. This strong-growing variety carried a long, branched spike, the flowers being white with numerous distinct markings of claret purple. A.M., R.H.S., May 12. Mr. J. Davis, gardener to J. Gurney Fowler, Esq., Glebelands, South Woodford.

ODONTOGLOSSUM NEBULOSUM (APTERUM) MOSSIÆ.

A neat variety that differs from the type in having its shapely flowers pure white, save for the yellow crest on the lip. A.M., R.H.S., May 12. Mr. J. S. Moss, Wintershill Hall, Bishop's Waltham, Hants.

ASPARAGUS FILICINUS.

A slender-stemmed erect-growing species that is particularly elegant and beautiful. It is bright green, and the growths spread out frond-like. The little leaf-like blades are practically all on one plane, and do not surround the stem, as in Sprengeri. The species is Himalayan, and may prove hardy in the southern counties. A.M., R.H.S., May 12. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

AUBRIETIA PAUL'S PINK.

Another very fine aubrietia, a little late in flowering. It has large blooms of a charming and effective pink shade of colour. A.M., R.H.S., May 12. Messrs. Paul and Son, Cheshunt.

AURICULAS.

May Day.—A beautiful yellow self, with white paste; it has very large blooms. A.M., R.H.S., May 12. Mr. Jas. Douglas, Edenside, Great Bookham, Surrey.

Mildred Jay.—A splendid alpine auricula, with yellow tube, and pale mauve-purple margin to the bright purple body colour. A.M., R.H.S., May 12. Mr. James Douglas.

Coronet. — A well-defined, large green-edged show auricula. A.M., R.H.S., May 12. Mr. J. Douglas.

LARIX GRIFFITHI.

A rare larch, and one of the most difficult to cultivate in Great Britain. It comes from Sikkim and Bhutan, where it was found in 1838. In its native home it will grow 65ft. high; at Kew it has never exceeded 3ft. high, but at Leonardslee, Horsham, it succeeds better. Commercially it is valueless, and as an ornamental plant it can only be considered worthy of trial in the milder parts of the country. "Bot. Mag.," t. 8,181.

BERBERIS ACUMINATA.

First discovered in Yunnan by the Abbé Delavay, and more recently by Dr. Henry and Mr. E. H. Wilson; this fine shrub proves to be a most distinct one. It is most closely allied to B. Wallichiana; it has narrow spiny leaves, and bears its bright-yellow flowers in small fascicles all along the slender growths. "Bot. Mag.," t. 8,185

CYPRIPEDIUM DEBILE.

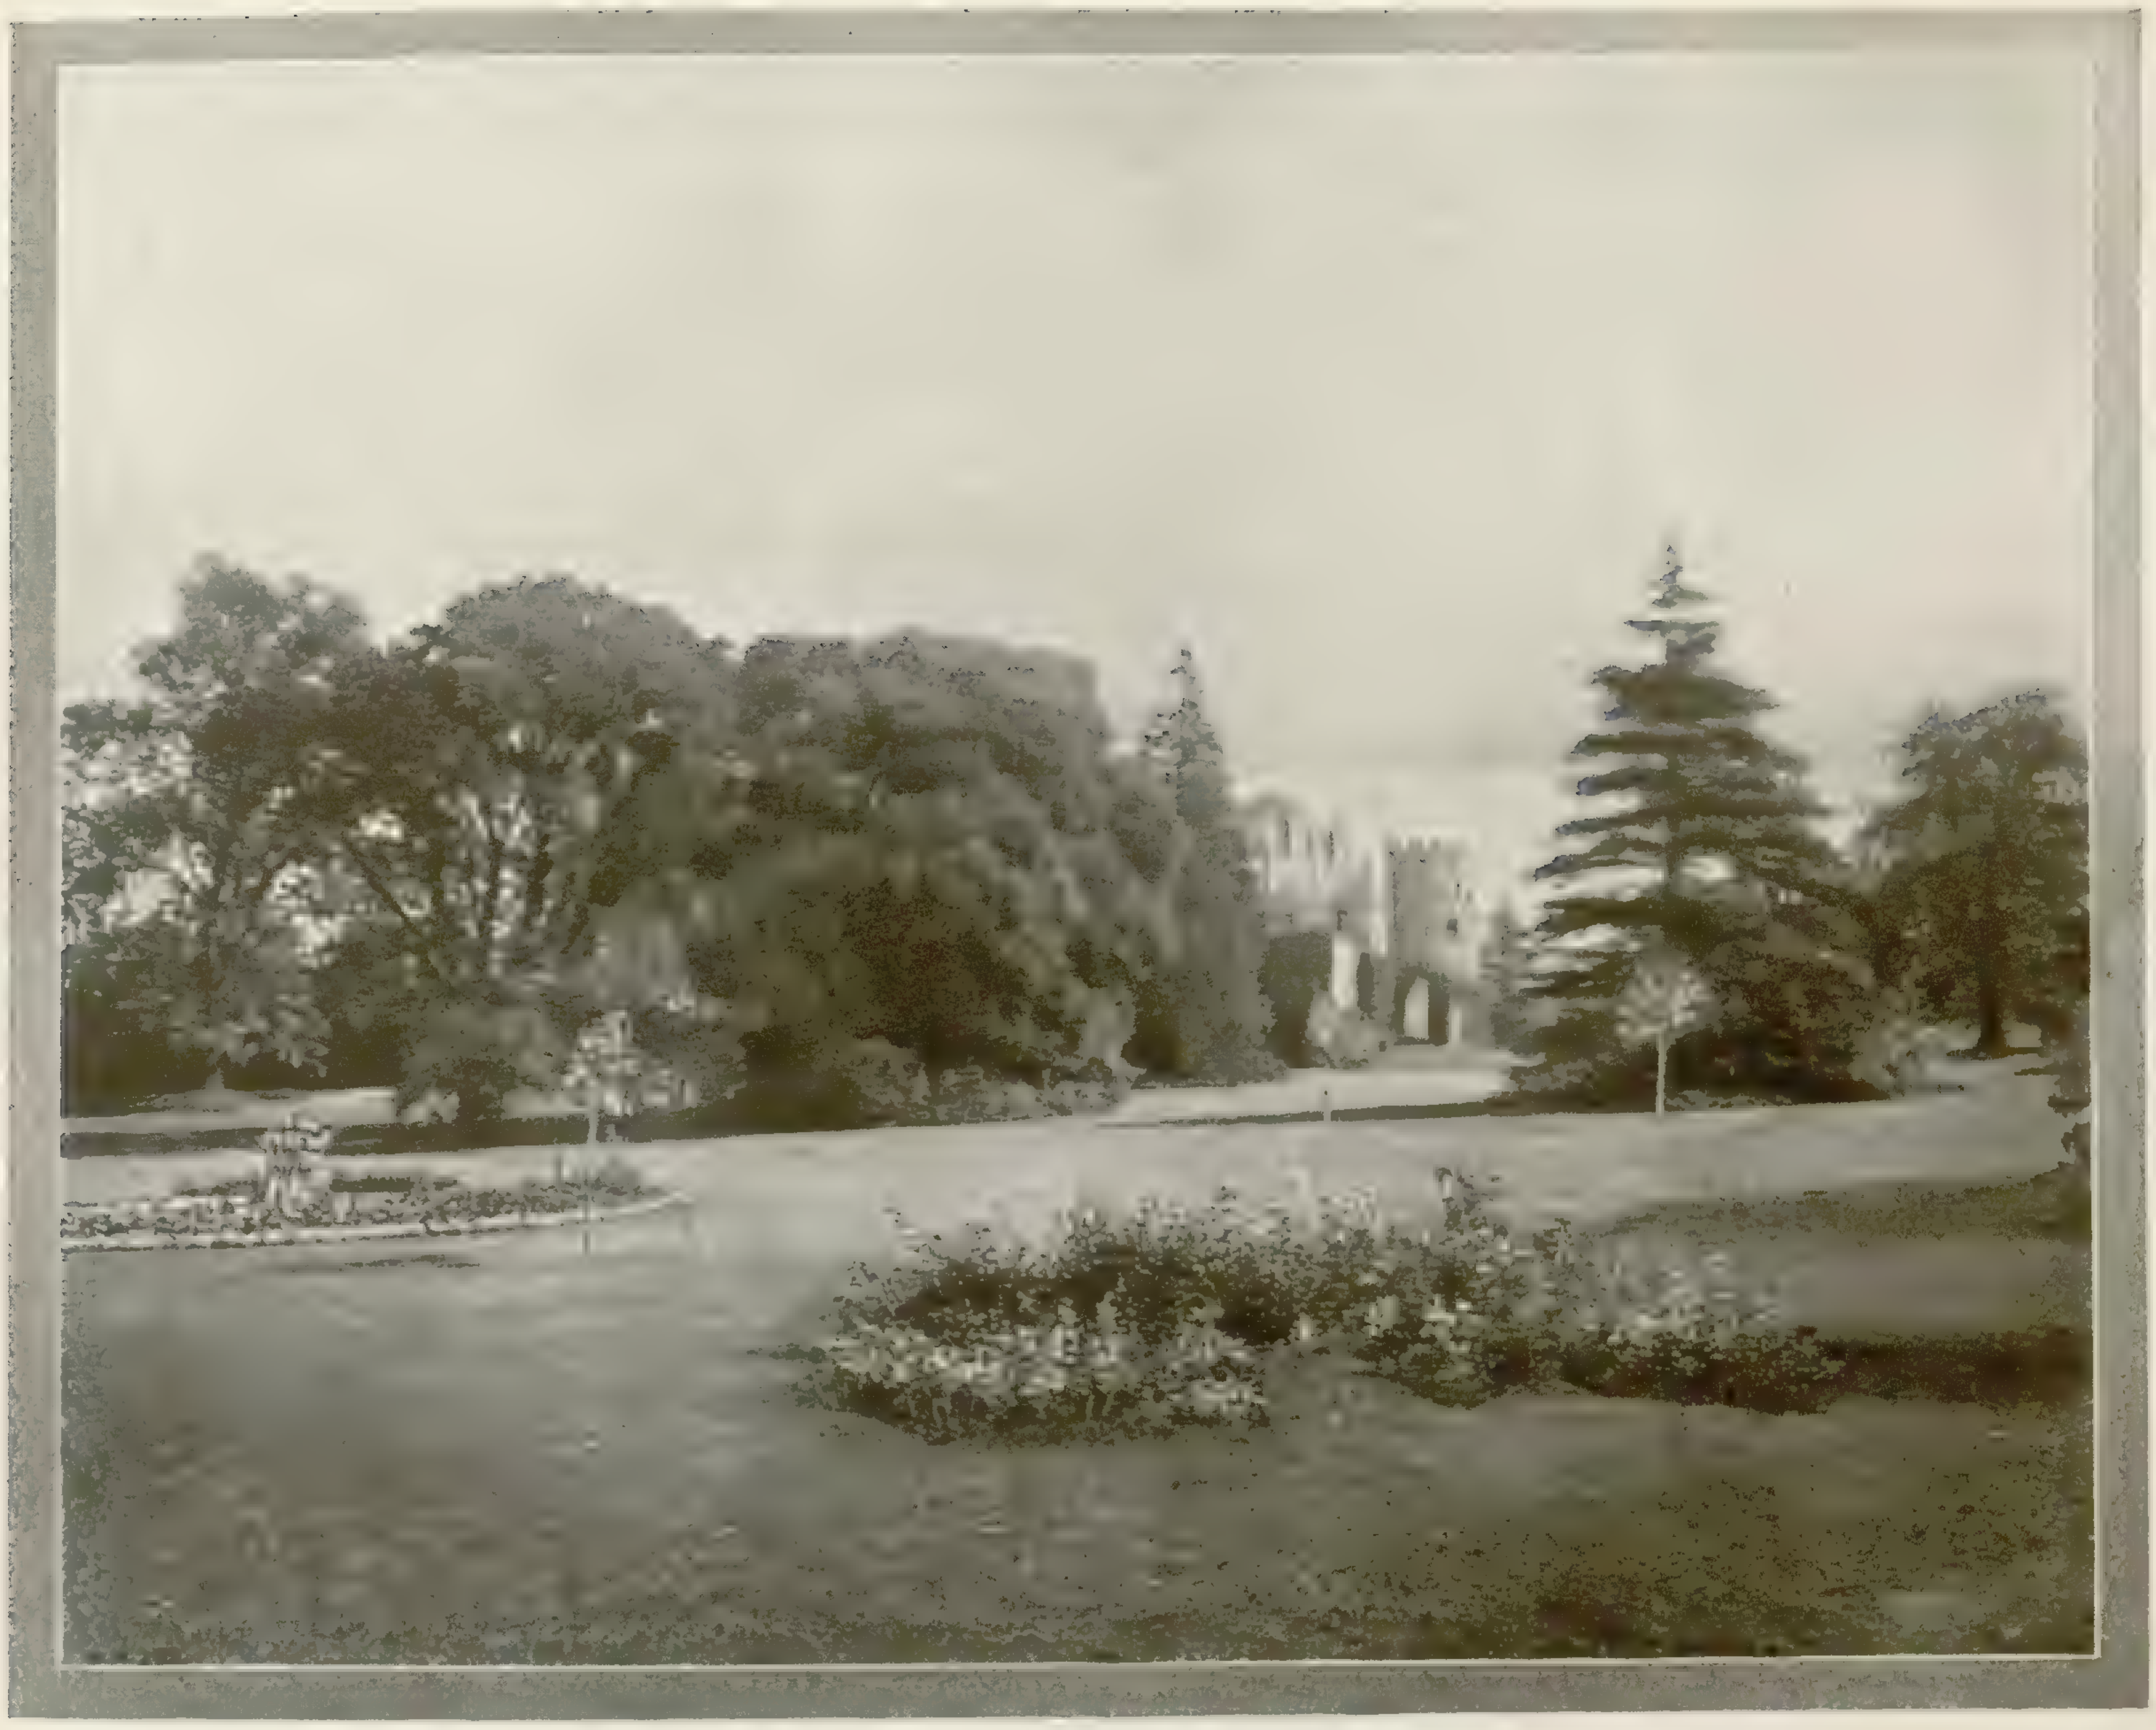
A quaint little species from China and Japan; it is a terrestrial orchid, growing rather less than six inches high, bearing slender two-leaved stems, each producing a little arching scape, carrying one small flower that has pale-green sepals and petals, marked with brown at the base, and a roundish, inflated lip that is white, with purple streaks and has a greenish base. "Bot. Mag.," t. 8,183.

SINNINGIA REGINA.

A handsome Brazilian gesneraceous plant that was introduced as a chance seedling from Brazil by Mr. de Smet-Devivier, of Ghent. The stock was subsequently purchased by Messrs. Benary, of Erfurt, who distributed seeds of it and of hybrids between it and the garden gloxinias. The plant flowers freely when treated like a gloxinia; indeed, it resembles a semi-pendant-flowered gloxinia, but the flowers are [illegible] violet, with a yellow, purple-spotted band in the throat. As in the gloxinias, so in S. Regina, the root stock is a stout tuber. "Bot. Mag," t. 8,182.

ROSA WILLMOTTIÆ.

A charming new species from China, where it was collected on the Saugpan Mountains near the Thibetan frontier by Mr. E. H. Wilson. We understand that it is quite hardy. The species makes a densely-branched shrub from 5ft. to 10ft. high, and its slender, [illegible] brown branches are freely clothed with small leaves, each with nine leaflets. The flowers, borne singly on the short, lateral branchlets, are an inch or more across, and of a [illegible] rose colour, the buds being deep reddish-rose. The yellow anthers are a great attraction. "Bot. Mag.," t. 8,186.



COTE HOUSE AND GARDENS, BRISTOL.

SOME BRISTOL GARDENS—II.

◆

Cote House.

On the opposite side of Durdham Down, from Bristol, is Stoke Bishop, so named because it once belonged to the Bishops of Coutances, one of whom, Godfrey, held Bristol, in 1088, in favour of Duke Robert against William Rufus. Behind Stoke Bishop is Westbury.

None of the gardens around Durdham Down are better known than that of Cote House, at Westbury-on-Trym, the home of Mrs. St. Vincent Ames, and I think I am safe in saying that no gardener is more widely known or respected in the district than Mr. Bannister, whose association with the gardens began when many of us were very young. In his younger days Mr. Bannister gained experience in many of the finest gardens in the country, and during later years he was a frequent and highly successful exhibitor of garden produce, but chiefly fruit.

Cote House is an old, picturesque battlemented structure that has long been the seat of the Ames family. A hundred years and more ago the poet Coleridge, John Wedgwood, who befriended him, and who was brother of the creator of British art pottery, and the poet Southey, met frequently at Bristol, and it is supposed that they met sometimes at Cote House; it is said, moreover, that it was at Cote House Wedgwood first put forward the idea that presently developed and materialised in the formation of the Royal Horticultural Society. Be that as it may, the grounds of Cote House show that in those early days, and even earlier, the estate was well cared for, the splendid old elms, grand cedars, and fine limes and chestnuts being standing monuments of an early planter.

Right in front of the house there stands a particularly fine cedar of Lebanon, with mighty bole and grandly spreading branches. It is a magnificent tree and cones freely. Closely beside it, in the summer time, there stands a tiny but ancient Cupressus obtusa, a dwarfed specimen from far Japan. This giant and dwarf remind one forcibly of Landseer's famous picture, "Dignity and Impudence." The illustrations given herewith will at once convey to the reader the idea that the grounds of Cote House are finely wooded. and that coniferous trees are abundant. And this idea is a correct one. Deodars, Lebanon and Atlantic cedars, cupressus in variety, and Wellingtonias are numerous and large. The copper beeches are also particularly well developed, and there are some large oaks and a rare old tulip tree around the house.

Contrasting with the giant trees and sombre conifers is the rose garden on the south-east side of the house, planted on a site formerly occupied by beds of tender summer flowers. In excellent soil and a kindly climate these roses have thriven well. La France, Maman Cochet, Augustine Guinoisseau, and G. Nabonnand grow well enough to please the most exacting rosarian, and there is one bed filled with an uncommon, but very pretty pinkish-buff rose that bears the extensive title of Marquise de Querhoent. It is a Continental variety that is very beautiful, and one that grows well, though it might not find favour with exhibitors. Crimson Rambler and other climbing roses have been pressed into service for the adornment of pillars and arches, so that most sections of roses are represented. Some of the finest views in the garden are obtained from the rose beds, where the eye is carried out over the park and the valley to Shirehampton and the distant eminence where Blaize Castle stands. The fine old trees that surround her stately and historic home appeal most perhaps to Mrs. St. Vincent Ames, but if one wishes to draw out her gardener then one needs only to talk about fruits and fruit culture to discover where his affections chiefly lie. In all that relates to pomology and fruit culture Mr. Bannister is a master. With his own hand he planted practically every fruit tree in the garden, and he has seen them grow to a large size. He has a weakness for grafting and regrafting trees, especially pears, and, with a chuckle, he tells how he manages always to secure a crop, no matter what the season. Some trees carry from three to five varieties. and if frosts spoil the prospects of one or even two varieties, the third rarely fails, and in some kind seasons all the varieties will bear well. Here is an old General Todleben, grafted with Fondante de Thirriott, Princess, and Doyenne du Comice, and it is never a complete failure. In another case a Gansel's Bergamott is also partly Doyenne du Comice, and partly Beurre Bosc.

Outside the area absolutely necessary for the crops of vegetables, and those are finely grown, the enclosed kitchen and fruit garden has not a bit of space without its fruit tree, young or old. With apples as with pears, Mr. Bannister is quite au fait, and he tells with pride of his dozen fruits of Peasgood's Nonsuch that scaled 15lb. 13oz.; of six that weighed 8lb. 14oz.; of a pair that weighed 3lb. 7½oz., and of the one finest example of them all that was no less than 1lb. 12oz. in weight. You point to an immense old fig-tree that covers a large wall space, and extends over the gateway, and Mr. Bannister is reminded that it was once in a small pot and raised by himself. In the vineries the character of the man is also seen, for his experiments in grafting or its sister method of inarching is not excluded from the glasshouses. Mr. Bannister grew good grapes two generations ago, and grows good grapes still. He has a vine of a rich black muscat-flavoured variety named Venn's Seedling, that I do not remember to have seen in any of my previous travels.

Over the details of stove and greenhouse plants the pen must skip, stopping only to tell of a wonderful Ipomæa Horsfalli that completely covers the wall of one large warm house and flowers so profusely each year that Mr. Bannister is puzzled to find a reason why this beautiful climber is so seldom grown. One more example of this rare old gardener's skill and ingenuity is found in the mushroom house. Mr. Bannister crops both sides, top and bottom, of his beds! A stout angle iron framework is made to carry sheets of very stout open wirework, and on these sound old turfy loam is placed, and then a layer of prepared mushroom bed manure. Then the spawn is inserted, about three inches from the wire bottom, and more prepared manure is filled in firmly till the desired height is reached, when in due course the surface is spawned and cased over. In this way a crop of mushrooms is secured from both sides of the bed, and there is room for another flat bed on the ground below.

A very ingenious man is our friend, and a painstaking one also. Some years ago he thought schizanthuses might be improved and so he set about improving them, with the result that he raised the extremely floriferous and beautiful race that Messrs. Garaway and Co., of Bristol, distribute under the name of Garaway's hybrids. To the originator is left the task of keeping this fine strain up to the high-water mark of perfection, and one hopes he may be spared many years yet to produce other good flowers and graft many more pear trees.

THE FLOWER GARDEN AT COTE HOUSE, BRISTOL.

Down House.

An attractive building, clothed with ampelopsis, and facing across Durdham Down, is Down House, the residence of Howell Davies, Esq., M.P., a gentleman well-known in Bristol for his support of philantropic institutions. From behind the house the gardens slope rapidly towards the boundary wall, and this has necessitated the construction of a very high retaining wall to provide an elevated terrace along the garden front. The conservatory attached to the house is on this terrace, and from it, and indeed from all along the terrace, fine views are obtained over Shirehampton and Westbury-on-Trym.

The grounds of Down House are well wooded, and the elms are especially fine. A big oak, a towering Wellingtonia, a fine araucaria, and a splendid copper beech are also deserving of special mention. Roses are a prominent feature of the well-kept gardens, especially the rambling varieties that are extensively used to form arches, screens, and arbours, and right well they succeed. The high terrace wall, like the house itself, is entirely draped with climbing plants. Gloire de Dijon and other strong roses cluster around the terrace steps, while on the wider stretches of wall the broad-leaved Dutchman's Pipe (Aristolochia sipho), and blue ceanothuses spread themselves comfortably.

Bedding-out is not an extensive business at Down House, but there are summer flowers in plenty nevertheless. The borders contain a selection of flowering trees and shrubs, roses abound, and there is a long and well-kept herbaceous border along the front of the range of neat glass-houses. The latter are at the lower part of the garden, and it may be said here that the Down House gardens are not large, but every inch of space is cared for, and the most is made of it. Considering its size Down House has a rather large glass department, and a well-kept one, and Mr. J. T. Curtis is well known in the district for his skill as a plantsman and as a grape grower, and the potting-shed is ceiled and lined with a host of cards that prove his prowess on the exhibition table.

Orchids receive a fair share of attention though special houses are not devoted to them. The deciduous dendrobiums well grown in a plant stove, rested in a vinery and flowered in a warm conservatory. Cattleyas, Cymbidium aloifolium, C. Lowianum, and calanthes are other orchids that are most creditably managed, while cypripediums and cœlogynes are grown on a smaller scale. In the plant houses there is no waste space, and Mr. Curtis has shelves over every pathway and against every back wall, and so, by much contrivance, he manages to produce such an abundance of good plants as would astonish most people. Crotons, caladiums, palms, pandanuses, aralias, and other bold foliage plants abound. Allamandas on the stove roof produce hundreds of splendid golden flowers, and Gloriosa superba trained on balloon and also on umbrella-shaped trellises, are a very fine feature.

Mr. Curtis does not forget the merits of homelier plants, and so one finds brave batches of summer and winter-flowering zonal perlargoniums, Francoa ramosa, campanulas, Streptosolen Jamesoni, coleuses, winter-flowering carnations, tuberous and fibrous-rooted begonias, and other very useful subjects necessary where there are frequent calls for decorative groups.

THE GARDENER'S HOUSE, COTE HOUSE, BRISTOL.

In fruit culture as well as in plant and flower culture Mr. Curtis excels. The peaches on the outside walls are evidence of his care and skill, but it was very easy to see that his greatest love is for the vines. Muscat of Alexandria is splendidly grown, and bunches of good size and fine finish are always produced. Black Hamburgh naturally occupies considerable room, while Alicante, Buckland Sweetwater, and Lady Downes are other grapes for which the Down House gardens have a high reputation. There are both inside and outside borders.

Of the kitchen garden there is not room to write, nor of the collections of cactus dahlias and sweet peas, nor of the chrysanthemums arranged along the lower path. The whole place is wonderfully neat and compact, and testifies at once to the delight Mr. Davies takes in it, and the skill Mr. Curtis brings to bear upon his work. In conclusion, it is of interest to notice that a small fountain basin, surrounded by rock and water plants and once filled with goldfish, was the scene of a tragedy. The goldfish abounded, but last season the wind blew the pollen from the neighbouring yew trees on to the water, quite covering the surface. The goldfish all died, and the only probable reason for their sudden demise is that the yew pollen poisoned them.

The Priory.

Many years ago I was told of some wonderful pelargoniums that were to be seen at a garden in the vicinity of Bristol, growing against a long wall in a conservatory. I heard the story some twenty years ago from one who had been employed at Ashton Court, but who was himself only a purveyor of news, for he had not seen the plants. It was, therefore, with no small surprise I found myself admiring these old pelargoniums at The Priory, Westbury-on-Trym, as I entered the garden without the slightest idea that the foundation for that old bothy tale would be revealed.

The Priory has, probably, many associations with the early Saxon days when Westbury was the seat of a monastery. Even in much later times there was a clerical college here, but it was destroyed by the Royalists during the wars of the Commonwealth, to prevent its falling into the hands of the Roundheads. It is said that Wycliff and John de Trevisa were members of this college, and consequently Westbury must have been intimately associated with the work of the Early Reformation.

Devonhurst, Chiswick, once the residence of the Watts family, had gardens that extended along behind those of the Royal Horticultural Society, and these were very well kept. It is not surprising, therefore, to find that Edgar Watts, Esq., a member of the Devonhurst family, and who now resides at The Priory, is fond of and interested in his garden. Mr. Woodward, his gardener, is a strong believer in the value of horticultural mutual improvement societies, and, as assistant-secretary to the vigorous Bristol society, he works hard to increase their benefits to the younger members of the profession.

The Priory possesses a fine conservatory, with ample room for beds of permanent plants, and staging for seasonable flowers. Bougainvillea Sanderiana and Plumbago capensis provide wreaths and massed clusters of mauve or blue flowers up the pillars and along the roof. Tall fuchsias furnish the smaller pillars, and a big Datura suaveolens is the centrepiece. Specimen davallias and nephrolepis serve to add grace to the flowering plants, and large masses of Hedychium Gardnerianum and H. coronarium, yield fragrance as well as beauty.

But the corridor that connects the conservatory and house is the great attraction. The back wall is 76ft. long and 18ft. high, and every bit of it, from base to summit, from end to end is covered with zonal pelargoniums. Some of the plants are quite ancient, certainly sixty years old. Older readers will be interested to know the varieties here represented; they are: Stella, Tom Thumb, Countess of Buckingham, Lord Wolsey, Queen of the Belgians, Rev. W. Atkinson, Etoile de Lyon, Hyacinth, Lady Sheffield, Lucy Lemoine, Madame Berard, Gullian Mangilla, Agnes, Cassiope, Phyllis, and Duke of York.

There is a floral display in this corridor all the year round, but the glory of the many thousands of trusses of brilliant flowers is at its height during May and June. Regular attention is paid to the removal of old unnecessary growths and the training and tying in of new ones, and each spring the border is given a good top-dressing of chopped turf, to which is added a liberal supply of soot and bone meal. Certainly this pelargonium wall is a striking and unique feature.

With a few exceptions the houses are near the mansion, and they are devoted to carnations, ferns, cyclamens, primulas, begonias, and other flowering and foliage plants that are in demand. Beyond the conservatory and screened from it by a belt of fine deciduous and evergreen oaks is a rose garden, with a central lily pond around which a rockery is now built. Fine trees abound on every hand and include some famous old mulberries and graceful larches. Evergreen oaks skirt the drive, but the carriage way is chiefly notable for its Wellingtonias and Cedrus atlantica. In the front spaces, between the big trees along the drive, Mr. Woodward plants colonies of cactus dahlias, and these produce an unusually good effect in such positions. Behind the drive, and extending in terraces to the house, are broad new lawns for tennis, croquet, etc.

The Priory has an old walled-in kitchen garden, but practically all the fruit trees are new ones, indeed, the whole garden has been deeply trenched and entirely renovated in recent years. James Grieve and Early Transparent are among the apples that Mr. Woodward has planted freely. Pentstemons, sweet williams, violets, and mignonette grow amazingly well in this garden, and I measured flowers of Princess of Wales violet as big as a five-shilling piece. The vineries are very old, but they crop heavily and well. One Black Hamburgh vine, filling a large house, is about sixty years old, and shows no signs of failing. Muscat of Alexandria is well managed, and the old vines give fine bunches in quantity.

Large supplies of tomatoes and cucumbers have to be provided, and Mr. Woodward has come to the conclusion that Carter's Sunrise tomato, and Sutton's Every Day cucumber, are respectively the best varieties for long and regular crops. Both are seen at their best at the Priory. Chrysanthemums are grown largely for the big conservatory and the front of the corridor, and the great rows of sweet peas, consisting of twenty-six varieties, are ample evidence of the popularity of these lovely annuals with the members of Mr. Watts's family.

Old Sneed Park.

To the left of Stoke Bishop, as one crosses Durdham Down from Clifton or Bristol, and on the far side of the slope, lies Old Sneed, a very pretty residential district, where all the houses are finely built, and where the gardens are mostly of considerable extent. In the centre of this district is Old Sneed Park, with its mansion, the home of F. Tagart, Esq., set on a prominent eminence on the far side of the valley. The house and gardens are a long way from the entrance gates, close by which is Mr. Binfield's house. Mr. Binfield has for many years been head gardener here, and one soon discovers he has more than an ordinary affection for his charge.

The drive skirts the fields and meadows as it gently dips at first, and then steadily rises to the house and gardens. In the middle distance the farmstead nestles comfortably in the shelter of rising ground and a group of elm trees. The stacks of hay, the farm buildings, and the cattle in the fields make up a picture that many an artist might desire to place on canvas, and it is the more remarkable because it is all so near to a great and busy city. Presently the fields merge into lawns, with groups of shrubs and numbers of splendid old lime and elm trees, and then sweeps round to the front of the house, where, on the lawns, and almost in the centre of the broad carriage way are large flower beds.

GROUP OF ORCHIDS AT DOWN HOUSE, BRISTOL.

One very large bed occupies a prominent position in this central lawn in front of the house. Large numbers of plants are required to fill it and its central vase, and each year the scheme is as distinct as possible from its predecessors. Our view of this big bed shows a modified carpet bedding arrangement that was particularly popular a year or two ago. Echeverias, sedums, cotyledons, agaves, aloes, ricinus, mesembryanthemums, dwarf begonias, dracænas, Cineraria maritima, and small palms may all be seen in the illustration, and the manner of their association is so obvious that no description is necessary. Last season taller plants, such as cannas, abutilons, fuchsias, etc., were associated with tuberous begonias, so that a quite different but not less attractive design and arrangement were presented. Mr. Tagart takes a great interest in his garden and farm, and each year the filling of the big bed is a subject that comes up for discussion; indeed, the whole family regards this feature of the garden with especial pride, and there is great sorrow if an untoward season prevents the full development of the scheme decided upon.

The garden front of the house is very attractive, with its draping of ampelopsis, ceanothuses, euonymuses, ivy, and cratægus. In the borders next the house a profusion of bright flowers is provided all through the season. A small conservatory is attached to the house, but it serves rather as an extra and pleasant sitting-room than a place in which to set up a brilliant display of flowers. The conservatory proper is a large structure a few yards away, and one end of it is seen in the accompanying view of the mansion. Between the conservatories a central fountain is surrounded by narrow beds of dwarf flowering plants. Annuals are freely used, and the variously coloured Tom Thumb tropæolums are effectively planted here.

Fine ferns, notably some cyatheas, dicksonias, nephrolepis, and davallias are prominent in the conservatory, where, at the time of my visit big groups of finely-grown specimen campanulas, marguerites, pelargoniums, Trachelium cœruleum, and smaller kalanchoes, etc., afforded, with tuberous begonias, a brilliant spectacle. Mr. Binfield is a successful local exhibitor, and this big house and also a large neighbouring stove permit the cultivation of large plants that are of material service in large decorations, and add largely to the effect of a flower show.

A broad lawn practically fills the terrace along the garden front, but roses and other climbers cluster over the boundary wall. Many folks would want to cut up this lawn into numbers of flower beds, and thus spoil its beauty. Flowers there are in abundance in the lower terraces and walks, and every turn provides a new and pleasing surprise. Two giant Cupressus macrocarpa have long formed a dense living gateway to the lower grounds. They remind one of pictures of the gateways pierced in the great walls of Chinese cities. Probably thirty feet high and ten feet thick, they are kept closely clipped, and thus form a very interesting feature.

Hardy herbaceous plants find a very congenial home at Old Sneed Park, and I was particularly interested in the free use Mr.

Binfield has made of what may be described as the bulbous section of summer and autumn flowerers, a section that, to my mind, has by no means yet received the attention it merits at the hands of gardeners generally. The several classes do, perhaps, call for a little more attention than the great family of composite flowers, and are rather more expensive in the first instance, but the additional care and expense are trifling, and the results obtained are ample compensation. It is of gladioli, montbretias, irises, Galtonia candicans, the stately and beautiful liliums, hemerocallis, and tritomas that one thinks in this connection. The well-drained sunny gardens—almost hanging gardens, at Old Sneed are admirably supplied with all these in the long, straight borders that are sheltered in good old-fashioned style, by dense hedges of yew and box.

The fruit and plant houses, the kitchen garden and frame ground are all situated along a broad ridge opposite the mansion, and this ridge is extended through a semi-wild garden to a point overlooking the Avon, where a rustic shelter and seat command a fine view of the rocks and water. From a gardener's point of view, the irregular shape of the gardens and their position on sharply sloping ground, are not idealistic for working. They are strikingly picturesque and novel and well kept, but no great knowledge of horticultural matters is needed to discover that the attractiveness of Old Sneed is only maintained at the expense of a vast amount of hard work and continual care. Mr. Tagart provides the sinews of war, and Mr. Binfield the skill and care; each adds that loving interest without which no garden has marked character and real beauty.

Chas. H. Curtis.

THE PRIORY, BRISTOL.

FLOWERING TREES AND SHRUBS AT KEW.

With the extraordinary weather that prevailed during the latter part of April many of our hardy trees and shrubs usually at that time in flower were kept back, but with the more genial weather of May they came on rapidly.

As the same influence brought out the May flowering kinds, a visit during the middle of the month was especially interesting, and one was completely staggered with the wealth of blossom among the flowering trees and shrubs.

A list of the different subjects would be far too lengthy for the pages of the Gardeners' Magazine, hence these remarks will be more of a general than an individual character. The various members of the natural order Rosaceæ were, of course, very strongly in evidence, especially in the case of the apple, cherry, and plum families.

Apples and Cherries.

Of the apples the Chinese Pyrus spectabilis was particularly noted, with its dense rounded head completely clothed with blossoms, coral red in the bud state, but paler after expansion; Pyrus baccata (the Siberian crab), equally floriferous, but with white blossoms; Pyrus floribunda, a general favourite, often met with in gardens as Malus floribunda. Of this there is a deep coloured variety—atrosanguinea, some specimens of which were at Kew a glorious sight, their spreading yet slender branches being laden with rich-tinted blossoms. The Caucasian Pyrus Niedzwetzkyana is quite as striking as its name. It has stout, rather wide-spreading branches, while the apple-like flowers are large and of a distinct shade of red. The leaves, to be developed later on, have also a reddish hue. This species is at present very little known, but it merits increased cultivation, being in every way so striking and distinct.

The Japanese Pyrus or Cydonia japonica and its near relative Pyrus Maulei, are as bush plants represented by several varieties, and the collection thereof is particularly interesting and beautiful.

The cherries are also strongly in evidence, though in many seasons they would be nearly, if not quite, over by this time. The Japanese Prunus pseudo-cerasus, of which the variety J. H. Veitch is one of the most striking, contrasts markedly with the quaint, wide-spreading Prunus serrulata from China. Besides these there are the numerous forms of the Gean (Prunus avium); some of them have very large double flowers. Quite distinct therefrom is Prunus Mahaleb, a light, graceful tree, with semi-pendulous branches absolutely laden with clusters of pure white flowers, which individually are but little, if any, larger than those of the hawthorn. That pretty little prunus which is so much used for forcing, viz., P. japonica flore plena, is for trade purposes usually grafted on to the sloe, the suckers from which are always a nuisance. At Kew there is near the fern houses a bed of dwarf plants on their own roots, under which conditions this double-flowered kind is seen at its very best. Close by is a bed of Amelanchier canadensis oblongifolia, the plants from four to five feet high were quite a mass of white, and springing from a carpet of Grape hyacinths, were seen at their very best.

Other rosaceous plants for which a word must be spared are Kerria japonica in its several forms, and Spiræa arguta, which is certainly entitled to a foremost place, if not absolutely first place, among the shrubby spiræas. It grows from four to six feet in height, and forms a dense bush, whose slender gracefully arching shoots are studded along their upper surface for some distance with little clusters of white blossoms, whose purity is enhanced by contrast with the blackish colour of the bark.

THE PELARGONIUM CORRIDOR, THE PRIORY, BRISTOL.

Azaleas, Heaths, Rhododendrons.

Next to the rose family in point of numbers comes the ericaceæ, of which there is an attractive and interesting series arranged in beds at the back of the Palm House, where the moist sub-soil is very favourable to ericaceous plants in general. Each kind fills a bed or two, so that they can be well studied from a decorative standpoint. The best at the time of my visit were Kalmia glauca, Rhododendron (azalea) amœnum, Rhododendron racemosum, which charming little species varies considerably in habit and in colour of the blossoms, and Rhododendron compactum multiflorum, a dwarf growing garden variety whose light flowers are marked with red. Besides these the beds of Erica Veitchi were nearly over, though they had been very beautiful, and the hybrid Rhododendrons (azaleas) of the mollis class had but few flowers expanded.

In the rhododendron dell large masses of such early varieties as Broughtoni, Russellianum, Auguste Van Geert, and Smithi coccineum lent colour to the scene, lighter tints being represented by such kinds as caucasicum, pictum and macranthum. A bush of the variety Ascot Brilliant, raised many years ago by Mr. Standish at Ascot, was remarkable for the rich blood red of its flowers, a feature inherited from one of its parents—the Himalayan R. Thomsoni.

Near King William's Temple many of the smaller kinds are gathered together, and flowering plants were numerous. Among others especial mention may be made of R. anthopogon, a little straw-coloured species from the Alpine Himalayas, R. Smirnowi, with lilac flowers and leaves curiously felted on the undersides, R. compactum multiflorum, a garden form, with light coloured blossoms, R. glaucum, with rosy-purple thimble-shaped flowers, a native of the Himalayas, R. rhombicum, whose purple flowers somewhat suggest those of the North American Rhododendron rhodora, which used to be known as Rhodora canadensis.

The early-flowering heaths, such as Erica carnea and E. mediterranea were over, or at all events past their best, but in some parts of the gardens the other varieties of the Mediterranean heath were quite a mass of colour. The larger growing E. arborea and E. australis were also still fresh and pretty.

Brooms and Berberis.

The leguminosæ form an extensive class, and one member at least may be described as really gorgeous. This is the furze, whin, or gorse, which, represented chiefly by its double variety, forms during the spring dense masses of gold. Its merits are too often overlooked, as among its other desirable qualities is that it will thrive in poor hungry soils. The brooms were at the time of my visit more backward than usual, still, the sulphur-tinted Cytisus præcox was in full flower, as also was C. biflorus, whose yellow blossoms make their appearance simultaneously with the unfolding leaves. A notable feature of a large bed of the common broom (Cytisus scoparius) was the variation in the time of flowering, as some individuals were in full bloom, while others close by were only in the bud state. The variety Andreanus had only one or two flowers expanded, a remark which also applies to the white Portuguese broom (Cytisus albus).

Two delightful little hybrid brooms, both of which originated at Kew, made a goodly show. They are C. kewensis, whose habit and general appearance was well shown in the Gardeners' Magazine of May 9, page 355. The second, C. Beani, a hybrid between C. Ardioni and C. biflorus, is a more recent and up to the present, scarcer plant. This is also of low growth, but not quite so spreading as C. kewensis, and when at its best forms a dense mass of rich golden yellow blossoms. Another of the pea family—the Judas Tree, Cercis siliquastrum, when in full flower presents at a little distance the appearance of a purplish cloud.

Miscellaneous.

Of the barberries those two well-known evergreen species, viz., B. stenophylla and B. Darwini were at their best. Concerning the last-named one cannot fail to be struck with the difference in the colour of the flowers, indeed, it is so noticeable as to suggest whether by a process of continual selection it might be possible to obtain a scarlet form of Darwin's barberry.

The flowering currants (Ribes) were in some instances over, but the two deep-coloured kinds—atrosanguineum and atrorubens were still in good bloom, as also was that variety of the golden currant known as aurantiacum minus. It is decidedly unusual to have the early flowering deciduous magnolias in bloom so late in the season, but at Kew many of them, even the little M. stellata, were in good condition.

The Californian Ceanothus rigidus, on the wall of the herbaceous ground, was simply a mass of lavender blue flowers, thus rendering it especially noticeable among the whites, yellows, and pinks which go to make up the bulk of flowering shrubs at this season.

Lastly, the comparatively new Viburnum Carlesi, which was given an award of merit by the Royal Horticultural Society on April 14, last, and was figured in the Gardeners' Magazine of April 25, was in full flower in the heath beds near the Pagoda, and it certainly promises to be a valuable addition to flowering shrubs. K.

Sweet Peas.—Another sowing of these may yet be made, and if sown in rows, on light, hot soil, it will be best to prepare shallow trenches, working in a good dressing of well-decayed manure. Should the weather in summer become very hot a mulching can then be given very easily. If sown in clumps in borders, make the ground surface saucer-shaped for the same purpose. Continue to stake or support all earlier-sown ones as they need it, and protect from enemies. Pheasants and wood pigeons are both very destructive here unless protection is given, and as it is impossible to net everything, we find it helpful to lay pea sticks thickly all over the ground, afterwards using them for supports.—E. F. H.

CATTLEYA BOWRINGIANA.

As this is the best season of the year for repotting or dividing Cattleya Bowringiana a few notes may be of interest relating to this superb autumn-flowering orchid.

It is a native of British Honduras, in Central America, where it was found growing on cliffs by water-falls, probably in 1884, but it is not in the 1885 edition of "Williams' Orchid Growers' Manual." We first had it from Mr. William Bull in 1889, and soon found it was a species deserving a rather large place in our collection. In "Sanders' Orchid Guide" it is described as growing from 9in. to 18in. high and being from 5 to 15 flowered. Several of our plants are 2ft. 9in. high, and exceedingly vigorous. One traveller in the orchid business says he only knows one garden where the plants are as vigorous as ours, and another says ours are the largest he sees in his travels. It is no boast to say we can easily beat any seen in establishments I visit.

A few details of culture may well be given. We grow our plants in a house mainly devoted to Lælia and Cattleya hybrids, C. Bowringiana being placed at the warmest end of the house. We use both pots and pans for their culture, but as they are only shallow rooting pans are quite deep enough for the purpose. Our pans are 18in. in diameter, and the pots are 12 and 14in. size. The pots we fill three parts full of potsherds, and pot the plants in a mixture of chopped sphagnum moss and good peat, well pulled to pieces and with the fine part shaken out; with this we incorporate pieces of brick and charcoal, broken small. The potting should be finished off so that the plants are well above the rim of the pot or pan. The plants should be divided every two years or potted into larger pots or pans.

C. Bowringiana requires plenty of water during the growing season, May, June, July, August, and September. When they flower in October water must be more sparingly applied, and it is better to move the plants to a drier atmosphere as the flowers are apt to become spotted if damp, and lose their beauty. After flowering the plants should have less water, but never be allowed to become dry at the roots or the bulbs will lose their plumpness, which is detrimental to the health of this orchid.

They are subject to the usual insect enemies, scale, yellow thrip, etc., which must all be dealt with in the earliest stages of the attack, the scale by cleaning it carefully off, and yellow thrip by fumigation. We do not practise syringing the plants, but on very hot days in the afternoon we sometimes spray them over with tepid water, using a Muriatori sprayer for the purpose. W. M.

Cheshire.

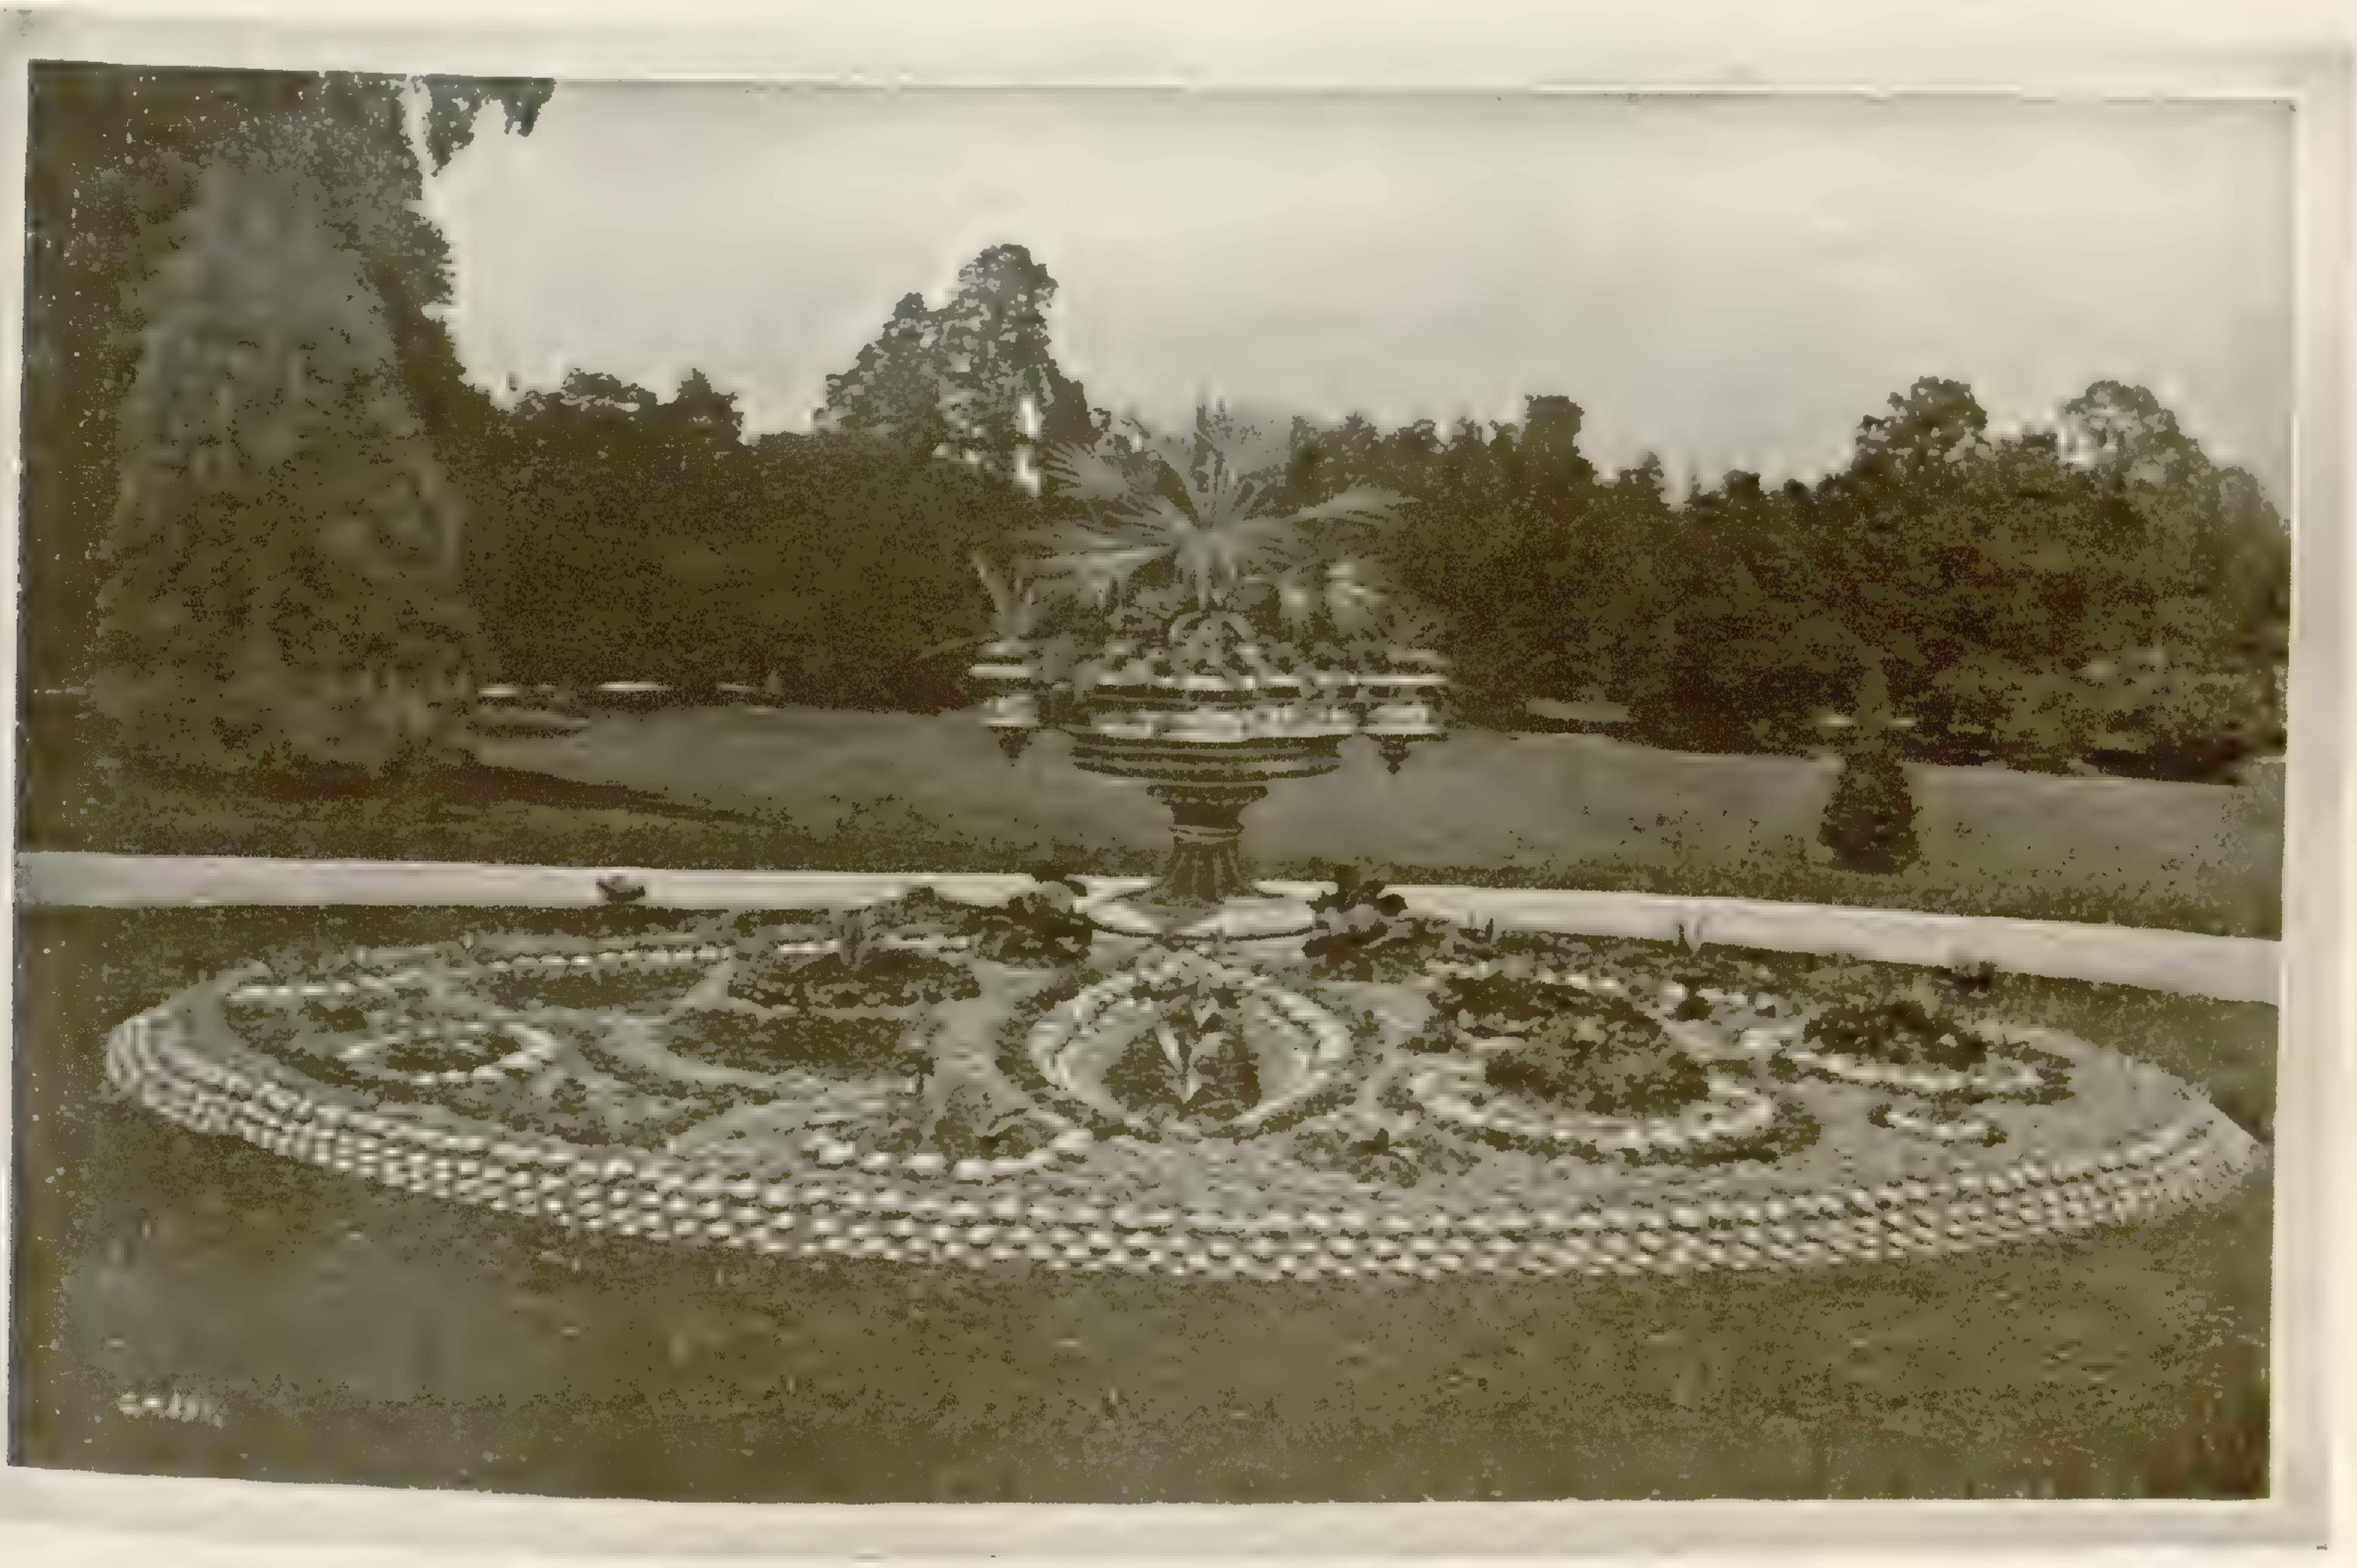
POPULAR CACTUS DAHLIAS.

It is always a difficult matter to make a selection of dahlias from catalogue descriptions, for when the plants are to be sent out, we have the elaborate description of the raiser, followed by the general trade description in abbreviated form, until they convey little idea of the value of colours. Again, many would-be dahlia growers select the names of their varieties at an exhibition. From an exhibitor's point of view, this is doubtless correct, but where the plants are required for decoration in the garden one ought to see the plants growing, for there is nothing more disappointing than a huge plant that to all appearances is simply a mass of greenery, and that does not make a decorative display. It will be a good thing when dahlia growers publish a list of the varieties that exhibit their flowers well above the foliage. Trials in this respect have been carried out by the Royal Horticultural Society at Wisley, but I do not think they have satisfied the dahlia community. The conditions imposed on the plants have been such that many of our best garden varieties have failed to give a good account of themselves. I believe an alteration is to be made this season. It is all very well to put out a plant in the garden and let it take care of itself, some, no doubt do very well under such circumstances, but the majority do not. In making a selection for exhibition or garden purposes, one has to bear in mind the object they are required for, and select accordingly, and where the grower has no knowledge of the matter it is advisable to leave it in the hands of a reliable grower, who has a reputation to maintain.

It is, however, not an easy matter to make a limited selection, because it is largely a matter of opinion and taste; but should any reader wish to bring their collection up to date or to start on a fair level, I would suggest the following varieties, which are culled from those introduced in 1907, and which can be obtained from twelve to eighteen shillings per dozen: Australian, rich purple; Caradoc, yellow, with extra strong erect stems; Flag of Truce, white; Crespy, pale heliotrope; Clincher, heliotrope, with a white centre; Daisy Staples, a bright mauve-pink; Eureka, purple, a variety that will grace the exhibition boards; Imperial, reddish carmine; Kathleen Bryant, rich crimson; Rev. A. H. Hall, ruby-crimson; Ruby Grinstead, rich pink, shaded fawn; and Whirlwind, a shining crimson.

Garden Varieties.

It is, perhaps, not generally realised that dahlias are something on a par with varieties of fruit or even of potatoes, all do not succeed equally well on all soils. A variety may do splendidly in one district, while in another it may prove unsatisfactory. Again, it is also necessary to change one's stock occasionally, but I shall deal with this matter on another occasion. The following varieties are thoroughly reliable for garden purposes, none of them are too tall, and they all flower freely, with flowers standing clear of the foliage: A. D. Stoop, rich crimson; West Hall, scarlet; Lustre, vermilion; Primrose, primrose; Mrs. F. Grinstead, rich crimson, tinged purple; Florence M. Stredwick, white; Amos Perry, rich red; Dainty, pale yellow, shaded pink; Pearl, rose-pink; Thomas Wilson, reddish fawn; Butterfly, crimson, with white tips; and Alexander, deep crimson. J. B. Riding.



LARGE FORMAL FLOWER BED AT OLD SNEED PARK, BRISTOL.

AMONG THE DAFFODILS AND TULIPS.

The present season has not been a kind one to daffodils and early tulips. The flowers were so long in the bud state that when a little sunshine opened them they were short lived. However, any little disappointment experienced this season is due to the weather vagaries, and not to the flowers themselves. Next spring, perchance, will be kindlier, and then we shall admire the individual blooms as keenly as we this season have admired the great breadths of flowers in garden and woodland, park and nursery.

Wisbech Floral Farms.

Messrs. R. H. Bath, Lim., Wisbech, have a very large tract of fen land under cultivation at Wisbech, and here they cultivate fruit, daffodils, tulips, pansies, and violas, carnations, tomatoes, hardy herbaceous plants, and sweet peas in surprisingly large quantities. On the occasion of a recent visit we inspected eighty acres of daffodils and eleven acres of tulips, and the display was a marvellously beautiful one, and also a delightfully fragrant one. Wooden screens serve to afford slight shelter for the choicer and costlier daffodils and tulips, but the great bulk of the tulips, and the trumpet and other bold daffodils is right out in the open. The poeticus group of daffodils and the elegant Leedsi varieties are largely grown in long beds between rows of apple and currant, or plum and currant trees, and here they are very effective, and the trees afford that little shade they love so well. Altogether there are a dozen acres of Poet's daffodils at Wisbech, and the great tracts of snowy blossoms ready for market provide a picture not easily forgotten.

Daffodils.

The selection of Poet's narcissi at Wisbech is good, and great faith is shown in Laureate, a comparatively new seedling that is very strong, has large white blooms, and a richly-hued cup. For garden or for market it is a fine daffodil. All the large plots of daffodils at Wisbech are planted after the plough, by women; the share is set at one and a half times the average depth of the bulbs to be planted. The chits, or small bulblets, of many commoner varieties remain in the ground for three years, and in the third year they yield an enormous crop of flowers and give fine bulbs. But in most cases the flowering-sized bulbs are lifted annually, as they are shapelier when thus treated. Standard varieties grown in quantity are lifted with a plough.

We need not stay to discuss the merits of Emperor, Empress, Horsfieldi, Grandee, and Sir Watkin more than to say that in the second year of planting a quarter acre of this latter variety will yield 1,050 dozen of fine flowers. Such splendid sorts as these should be planted by the thousands. For the woodland and for grass the sulphur-coloured W. P. Milner and the white, pendulous William Goldring are first rate. All the Poet varieties are similarly suitable. Autocrat is a fine incomparabilis, cheap enough to plant extensively; and the Hon. Mrs. Barton, whitest of Leedsi varieties, is another beautiful and cheap variety. Duchess of Westminster is one of the best of the Leedsi group, with white segments and light canary yellow cup; Gem is smaller but of rounded form, and one that has been rather overlooked. Queen Sophia remains a little expensive yet, but it is a lovely incomparabilis daffodil, with a frilled orange-scarlet cup of great beauty. Princess May is an orange cupped variety of this group, and one that may be grown largely at a sma'' utlay.

Turning to the trumpet varieties, we were attracted by the wonderful freedom of that very beautiful cream and white variety Mdme. de Graaff; this is fine for pots or beds, and no collection is complete without it, but for extensive planting most of us must wait for it another year or two. Mdme. Plemp, with its long golden trumpet and white perianth, is deserving of wider culture. Duke of Bedford, of fine form and soft colour, is one of the newer varieties. Victoria, despite its beautiful form, and its value for forcing, is not a good bed or border variety. Weardale Perfection, one of the largest of trumpet daffodils, is, like the even more beautiful King Alfred, a flower for the fancier. Those who want a very big trumpet daffodil at moderate price should consider Glory of Leiden, but it lacks the refinement of some other varieties. Mdme. Plemp, Golden Spur, Emperor, Empress, Maximus, Horsfieldi, Grandee, and J. B. M. Camm, are all splendid varieties for general cultivation, and they are grown in many thousands at Wisbech.

Delightful daffodils belonging to other sections are Gloria Mundi, a grand incomparabilis; White Lady, an exquisite Leedsi; Maggie May, a rare and beautiful Leedsi; Beatrice, a charming and cheap Leedsi; and Fusilier, with vivid red cup.

Tulips.

More gorgeous than the daffodils were the tulips, and, looking across the acres of brilliant blooms, broken up into great patches of varied colours, one could but wonder why tulips are not cultivated a dozen times more freely than they are. There are early tulips and late tulips, single tulips and double tulips, self-coloured and fancy tulips, dainty little species and extraordinary Parrot varieties; indeed, tulips in such variety of form and size and colouring that surely there are enough to please everyone. Among bright colours there are such splendid varieties as Keizerskroon, Vermilion Brilliant, Scarlet Pottebekker, Prince of Austria, Tom Moore, and Duchess de Parme. The yellow varieties are especially beautiful, and King of the Yellows is fine for forcing, as well as other purposes; Prince de Ligny is a grand yellow variety of fine form and substance; Mon. Tresor is a popular golden yellow, and Yellow Prince with variegated foliage, is very interesting and attractive. Queen Emma, deep red, and Moucheron, deep red scarlet, are two varieties worthy of attention. Rose Gris de Lin is very free, large, and of a deep salmon-rose hue, a splendid tulip. Proserpine is a beautiful pink tulip, and Brunhilde as a white, with a little touch of greenish-yellow on the outside base, is one of the finest and boldest of varieties. White Hawk is good and of great value for forcing; and Artus, as a scarlet variety for large beds or borders, is hard to beat at a modest price. Cottage Maid, with its pink flushes over white, and Queen Wilhelmina, deep rose-pink are a beautiful pair. La Reve, salmon-pink over buff, is a very distinct and handsome tulip that is certain to become very popular. Cottage Boy, an orange-yellow and red counterpart of and sport from Cottage Maid, is also a commendable variety.

That double tulips are growing in popularity was evidenced by the large breadths of them at Wisbech. A selection of the best would include La Candeur, white; Vuurbaak, scarlet; Rex Rubrorum, crimson-scarlet; Queen Emma, cerise; Murillo, pink; Couronne d'Or, yellow; Toreador, red and yellow; and Tournesol, red and orange.

The Messrs. Bath have entered heartily into the business of bulb cultivation, and have shown that the very finest tulip and daffodil bulbs can be grown in this country. The firm grows the bulbs it sells, and instead of being importers they are now frequently exporters, even to Holland.

Long Ditton.

In one sense Long Ditton, near Surbiton, may be regarded as the home of the daffodil, for here are the nurseries of Messrs. Barr and Sons, and it was Mr. Peter Barr who first made the horticultural world comprehend the beauties and usefulness of this family of spring flowers. Ever since Mr. Barr brought together existing varieties and commenced to introduce new ones, the firm has also done much work in improving the flowers by cross fertilisation. So long as daffodils are grown the name of Barr will be held in high esteem.

Daffodils.

This season, the daffodil season, so far as the big breadths of varieties are concerned, was a very short one at Long Ditton. small batches planted late in various tions enabled visitors to make compar and selections for future guidance and The newer varieties attracted our atten mostly. The brilliant broad-cupped Scarlet was very fine; it gives a bit of finest colour in the family. Cassandra Chaucer are both good Poet's narcissi. via, a strong-growing Leedsi form, is ch ing, but White Lady has even gre charms, and is a fine grower, with large flowers. Rosalind, a pretty white Bur with deep red eye, is a fine and useful daffodil; while Firebrand, in the same tion, is notable for its brilliant cup. Star, a grand flat-crowned daffodil, the progress made in this particular tion; the broad, frilled crown is ye orange, and orange-red—a striking com tion. Polestar, Egret, Gold Eye, and all belong to this latter section, and the named, with its flat yellow crown, is pretty.

Evelyn Hodge, a cross between N. monta and N. biflorus, has a round white with yellow eye; it is free, late, and new. Of different character is the Merry Maid, a very rich Barri form with vivid red rim to its yellow crown. Harvey, a beautiful Leedsi, and Bian refined flower of the same class, merit attention. The newer trumpet varieti clude the king of white trumpet daff Peter Barr; G. P. Haydon, a splendid va with palest yellow trumpet and white anth; Knight Errant, white with trumpet; Pharoah, creamy white, with yellow trumpet; C. H. Curtis, a flower with heavily frilled trumpet King Alfred, the grand golden trump dil; and Mrs. G. H. Barr, snowy white

Twin-flowered daffodils have always ested us, and we believe that for gard not for market purposes, varieties that two flowers of good size on one stem long be required in quantity. In these flowered varieties one flower always before the other, and consequently the ral display is prolonged; while if the cut as the first flower expands, the flower opens in due course in the room. The old N. biflorus is not to pised, but in The Twins, The Sis Cloth of Gold, St. Patrick, S. A. de A. Rawson, Miss White, Hyacinth, and others, the blooms are of good varied colours. The hybrids betw Tazetta and the larger-flowered daff sure to yield many fine garden pla the Messrs. Barr's seedlings conta promising forms.

The Ditton collection is rich in daffodils, and a few others besides ready referred to are Janet Image, the biggest and best; Elaine, silvery Diana, white and lemon-yellow; Mag white and citron; Heroine, snow w citron and orange crown; Silver M very white, very pretty; White Sta White Queen, the latter a large and white variety with citron-tipped

Tulips.

Passing to the tulips, we paid tion to the Darwin group, the which were just expanding beneath fluence of genial weather. Heliotr and violet shades are now very among ladies, and so we may such tulips as Gudin, silvery helio H. Ewbank, soft heliotrope, with a Electra, lilac-rose; Cordelia, deep silvery shading; Corydon, heliotr thy, heliotrope and white, and rosy violet, come within this class Of very high merit in this class Mr. Farncombe Sanders, rosy-sc garet, lovely blush; Sultan, very ish maroon; Mrs. Krelage, Hecla, crimson; Europe, Clara Butt, exquisitely beautiful Pride of Haarlem, very bold scarlet crimson; Glow, fine cherry red, salmon-rose. There are many merit, and as the season is a late is ample time for visitors to make selections, as Darwin and other May-flowering tulips are as remarkable for their lasting power as for their beauty and effectiveness.

The collection of cydonias, the fine polyanthuses, the splendid set of pumila and other dwarf irises, the saxifrages, and the beautiful aubrietias are a few other of the attractions at present to be found at Long Ditton.

ISOLATED GARDENERS.

Through the very nature of their calling it is the lot of many gardeners to live quiet—shall I say hum-drum?—lives, a long way from town or railway and far removed from any centre of excitement and activity. Compared with fellow craftsmen who reside within easy touch of the metropolis or some other big centre of population, these isolated gardeners have few opportunities of keeping in touch with the progress of horticulture, and it would not be surprising if they got quite out of date, as it were. To their credit, however, it may be said that, with here and there an exception, they do not; and, on the other hand, isolated gardeners, as a rule, are a well-informed class of men. We hear a good deal about gardeners of the present day being inferior to those who belonged to what we are pleased to call the old school, but it is all nonsense, and the typical isolated gardener is a proof of this.

He may be a little prejudiced in some things, but the narrow limits of his surroundings tend to make him so, and men must be judged by their opportunities. As a rule, the isolated gardener is superior in intelligence to the individuals with whom he is brought in daily contact, and for the want of congenial companions he lives his life very much to himself. Fortunately, he has the capacity for adapting himself to circumstances, and he has his books, his papers, and his work. Let us take the latter in rotation.

First there are books. Well, the isolated gardener stands at a disadvantage with his friend in a town suburb as regards books, but if the supply is limited he reads more diligently, and probably gets more real benefit from his reading. Then there are the papers. Perhaps the news is a day old when the isolated gardener gets it, but the newspaper is the connecting link between him and the outside world, and he devours the contents with an interest unknown to the man who just scans the chief items on his way to business in town. At the week-end the gardening papers arrive at the isolated establishment, and our friend is in clover, for this is the channel through which he is kept in touch with horticultural matters. Let it be remembered that the isolated gardener reads—yes, reads—his horticultural journal, and the news items are the first to be devoured. It is not the solid practical article on the cultivation of the potato that attracts our friend (though he will religiously read this and agree or differ with the writer, as the case may be), but it is the items of news, which tell how the horticultural world wags outside the narrow limits of the garden in which he labours.

The quiet country garden is far removed from the busy printing office and the editorial sanctum in London, and it is not the nature of the isolated gardener to dictate, but he hungers nevertheless for news, and when he tears the wrapper from his weekly gardening paper on a Saturday morning he does it with an expression that seems to say, "Ah, now I shall get to know how things are moving." Do not think that the isolated gardener is so wrapped up with his little world that he has no interest in outside matters, for such is far from being the case, and if he is not in the front ranks, he is a gardener, and one of the crowd, therefore his interests are in things horticultural. It is a godsend to our isolated friend when a neighbouring gardener drops in to have a look round, for the two can talk shop to their heart's content, and he welcomes even the nurseryman's traveller, though he may have no order to give him, for the latter has interesting little items of horticultural news to impart as together they walk round the place, and he feels that he is in the company of one of his own fraternity.

It would take more than books, papers, and friendly calls to reconcile many an isolated gardener to his hum-drum life, but fortunately for him he has another factor, i.e., his work. Here we have the secret of his contentment, and the reason why the monotony of his daily round does not weigh heavily upon him. Gardening is fascinating work, it is interesting, and though all gardeners are not happy, comfortable, and contented in their situations, it is not the work they complain about, and if this was all they had to contend with, there would be fewer changes than there are. In his planning, arranging, and organising, the isolated gardener finds occupation for his spare moments, and, as in the case of the village blacksmith of immortal fame, "each morning sees some task begun, each evening sees its close." The isolated gardener has his triumphs of cultural skill, and though, perhaps, the products of his labour never find their way to the Royal Horticultural Hall at Westminster, nor compete for prizes at provincial shows, they serve an equally great purpose in bringing personal satisfaction to the grower and pleasure to his employer.

Though through sheer force of circumstances his life is cast in quiet places, our friend is by no means a recluse, and on the occasions when he has a holiday he shows no inclination to get away from horticulture. On the other hand, you find him at the Temple Show, the Fruit Show, Shrewsbury, or some other big exhibition, keenly examining the exhibits or hob-nobbing with his friends of the craft whom he meets on these occasions. The Temple Show is the Mecca of many an isolated gardener, and nobody knows so well as himself how much he looks forward to the little change which this event affords him. One doesn't need to be an expert student of humanity in order to pick out the country gardeners amongst the crowds who congregate at the Temple on the occasion of the great show. There is an individuality about our friend who has "come up for the Temple Show," which distinguishes him from the rest, and the real, unfeigned interest which he takes in everything is one of the strong features about him. He feels that he has a lot to do in a little time, and he must pack as much into those few days' vacation as it is possible for man to do.

And when it is all over it is a thoroughly tired gardener who leaves, perhaps with some regret, the bustle of London, to take up again the daily round, maybe for another year, in solitude and isolation, but he takes up his work with a new vigour, and feels thankful for these brief opportunities of rubbing shoulders with the outside world. H.

Turnips.—Early sowings should be thinned out without delay, for if the plants become drawn the roots are sure to be of inferior quality. Make small sowings at short intervals of Orange Jelly, Snowball, and White Milan. To obtain tender roots of turnips, it is necessary to choose deeply-worked, well-manured soil.—T. W. Birkinshaw.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MEXICAN LÆLIAS. — Such species as Lælia albida, L. autumnalis, the different forms of L. anceps, and the natural hybrids of this class, will be producing their new growths, and repotting may be attended to at this season. It is not advisable to disturb plants more frequently than is absolutely necessary. In the case of L. anceps, a great deal can be done by pegging back the leading growths during top-dressing, and many growths that have exceeded the limit of their receptacles may with care be brought back in such a way that they may add to the appearance of the plants. Top-dressing generally becomes a necessity where plants are subjected to a prolonged resting season. The dead sphagnum moss will need to be replaced by living material, and any decaying matter on the surface may be removed. Division of the pseudo-bulbs, either to increase the stock or add to the size of the specimen, may be done at this time. I consider two or three bulbs behind the leading growth to be ample; the rhizomes between the pseudo-bulbs may be cut asunder behind this, and there is little trouble in inducing them to produce new growths in due course.

THE COMPOST we find suitable for these orchids is a mixture of fibrous peat, sphagnum moss and about one-fifth of broken oak or beech leaves. Sufficient sand and broken crocks being added to render the compost porous. The success or failure to flower L. anceps depends entirely upon the conditions under which the plants have to be grown. I consider it well nigh impossible to produce satisfactory flowering of the white section when the plants have to be grown in a cattleya house under the same conditions as the cattleyas. To do the white L. anceps, L. autumnalis, and L. majalis justice a house should be set apart for their culture. Where this is provided, cool and dry airy conditions can be afforded in the spring; this has the effect of retarding the growing season until a period when the plants are benefited by the heat of our all too short summers. Where plants can be grown together in this way, little or no shading is required, as a discreet use of the ventilators will prevent scorching. It is well to retard growth if possible until the present season, and very little root moisture is necessary until the plants get into full growth, and then liberal moisture must be afforded. Shutting up early as the season advances and syringing the house overhead, thereby procuring a hot, humid atmosphere, suits the plants well as the season advances.

IN THE CATTLEYA HOUSE, where these lælias have to be so grown a portion of the house should be set apart for them in a position where the maximum available light is obtainable, and if possible where the roof blinds may be removed earlier than may be safe for the cattleyas, or they may be suspended near the roof glass, but the chief aim should be to procure as much light for the plants as possible. Without ample light, it is impossible to flower the plants satisfactorily. I would advise also that the plants be afforded only sufficient moisture at the present season to retain the pseudo-bulbs in a normal plump state, and for the encouragement of the newly-formed growth. Syringing overhead in bright weather is advantageous, and is best done in the mornings. As growth advances more liberal treatment may be afforded. Rain water should always be used, both for watering and syringing. If hard water is used, there is little prospect of the sphagnum moss growing, and in syringing a white deposit will be found on the foliage.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PLUMBAGO ROSEA.—This plumbago is most valuable as a winter-flowering subject for the intermediate stove. It is very easily propagated at this season from cuttings of the young shoots, which are produced in abundance after the spring batch of flowers is over. Insert about six cuttings firmly in four-inch pots filled with a sandy compost; keep moist and plunge in gentle bottom-heat. In a few weeks they will readily take root, and may be put singly into 60-sized pots, using as a compost good fibrous loam and leaf-soil in equal parts with a sprinkling of silver sand. Pot firmly, and shade from the hot sun, affording plenty of light by growing the plants near the glass. In order to counteract the naturally erect habit of growth pinch out the growing points occasionally. As the plants require further attention transfer them to larger pots. For the final potting use soil of a somewhat rougher nature, with a small quantity of well-decayed manure added; 5-in. and 6-in. pots are quite large enough for the final potting.

BEGONIA GLOIRE DE LORRAINE. — The earliest rooted batch will now be ready for repotting into 4-in. pots. For this purpose use a compost of good rough fibrous loam, peat, and leaf-soil in equal parts with enough sand added to keep the whole porous. During the operation of potting care must be exercised as the roots are easily damaged. Do not pot firmly, as this begonia appears to revel in a loose rooting medium. In the successful cultivation of this begonia the most essential items are careful attention to watering, abundance of heat and moisture, and shade from the hot sun. During July, August, and September, when the plants are growing freely, we usually fill up the evaporating pans with liquid manure each evening, and the house is occasionally fumigated with nicotine compound. Under this method of cultivation we have not experienced any trouble from the so-called Begonia Rust.

BEGONIA GLOIRE DE SCEAUX. — This forms a charming addition to any collection on account of its handsome metallic foliage, and it is sure to receive appreciation during its flowering season, which usually extends over the first three months of the year. Plants are now readily raised from cuttings, or, by cutting the stem into lengths growths will soon appear from the bases of the leaves. Its management is much similar to that outlined for B. Gloire de Lorraine, with the exception that cooler treatment is necessary. It succeeds well in a temperature of 55 degrees, and the plants, on account of their robust habit of growth, do not require much feeding. They also flower much more freely when the roots are restricted to small pots.

B. AGATHA is very like the well-known B. Gloire de Lorraine, but its flowers are larger and of deeper colour. B. Agatha compacta resembles a miniature B. Gloire de Lorraine, is of very compact habit, dwarf, and very floriferous. Cuttings of either of these may be inserted now, and treated as recommended for B. Gloire de Lorraine.

BOUVARDIAS.—Plants which were raised during the spring now require to be shifted into larger-sized pots as soon as they require more root room. They may also be gradually hardened off ready for their summer quarters, and well ventilated span-roof pits or frames are well adapted for this purpose. The stock ought to be sprayed over every afternoon, and the frames closed up, retaining some of the sun-heat, and under these conditions bouvardias will make steady progress; lightly shade during the hottest part of the day, and always keep the plants free from attacks of aphis or red-spider. Give ventilation on all favourable occasions. — John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

MUSCAT HOUSE.—The weather has been anything but favourable for these. Sudden bursts of sunshine, with alternately hot and cold nights, make up a variation not suitable for setting the flowers. It was necessary to syringe a little whitewash over the glass outside, during the few hot days at the beginning of the month, otherwise scalded leaves would have been numerous; ventilating takes up a lot of time, and damping down must be done carefully and according to the weather outside, as well as the inside temperature. When watered, if the vines are young, no manure will be required, and the clear water should be tepid. Do not overcrop young vines, as they soon show signs of it in the foliage, which refuses to develop. One of the best houses of Muscat grapes that ever came under my notice was in the North; here the vine shoots were allowed to grow down and cover the border inside (not the shoot that the bunch was on), and root action was kept up all the summer. When the crop was removed thinning was done gradually. The vines took more nourishment under this treatment. The borders were inside and out, and the rods were partly on the extension system.

FOSTER'S SEEDLING GRAPE.—This, ripening in the early Hamburgh house, will require to be kept rather dry, and any plants under them on the stage must be removed or the berries will crack. Let some of the shoots run for a time until the grapes are cut. Being thin-skinned and of a juicy nature this grape requires a little extra attention.

LATE VINES.—These will most probably be in flower, and should not require any assistance in setting; the bunches should have been drawn out to get them away from the shoot, especially in the case of Alicante, as the best bunches generally come in an awkward place and are difficult to thin. No great amount of fire heat will be necessary unless the weather continues dull, but the pipes should be well warmed at night and a little air be left on at the top. Lady Downes will probably be in the same house, and will not be so forward; this is more difficult to set, and may require assistance. An extra shoot should be left on the spurs of this variety in case one is broken during tying down.

GROS COLMAN and GROS MAROC do not require any assistance, and I find that these two varieties yield better on the extension system,as they are such rank growers. They also need a lot of room for this system, and are best in an inside border. Appley Towers makes a good late grape, and does well in the late Muscat house, where it obtains more heat; this also does better on the extension system. It is of good flavour and keeps well, and though the bunches are rather small they are of good colour.

FRUIT TREES IN POTS.—These will be fast swelling their crop, and will require to be plunged in the ground in the house, to keep the roots cool; they also do not then require so much water, though they must be liberally supplied with liquid manure, providing they are well established. They may be top-dressed with some fresh horse manure, renewing this as it becomes exhausted. Where these trees have fire heat this should be given with care, or the fruits will drop off. If a dry atmosphere prevails, especially for cherries, black fly is very troublesome; it must be sponged off as soon as noticed as it increases rapidly.—A. B. Wadds, Paddockhurst Gardens, Sussex.

THE KITCHEN GARDEN.

CELERY.—The earliest plants, which were pricked out in good time and have been carefully attended to are now ready for putting out in the trenches. Select the strongest, and all of one height if possible; take them up with good balls of soil, so that they do not flag when the sun is hot. A few spruce boughs placed over them will give the desired shade until they become established. Sprinkling water over the foliage late in the afternoon will also prove beneficial. Weak liquid manure should be given occasionally during the growing season, for if watering is not well attended to on dry soils the celery will be tough and stringy.

ENDIVE.—A few rows may now be sown for an early supply in drills drawn 15in. apart, allowing the plants to mature without transplanting them. But thin them out to a foot apart; Broad-leaved Batavian and Green Curled are the two chief varieties grown. Sow more seeds for succession at monthly intervals until the middle of August.

LETTUCE.—Tie up the most forward plants so that the hearts may become nicely blanched. Thin out successional crops, and plant the strongest thinnings on sheltered borders in rich soil; make small sowings every fortnight, according to the demand.

BROAD BEANS.—When the plants are from 2ft. to 3ft. in height, pinch out the tops, so as to assist the pods to mature early. This will be the means of preventing the ravages of black-fly. The plants should be given plenty of room to grow sturdily, then the pods will set quickly and come earlier into bearing. Sow a few more rows now for succession, and when they are through the soil some more may be sown for a late supply. A few dishes of this excellent vegetable are always appreciated, especially when they are sent to the table quite small.

WINTER GREENS.—The seedlings of most of these are now well up, and to obtain nice sturdy plants it is most necessary to prick them out into beds two or three inches apart, placing a label to each variety as the work proceeds. This will give them ample room to develop, and they will be dwarfer, and more able to withstand the hot weather when removed into permanent quarters.

MARROWS.—These are always welcome, and plants that were raised from seed sown early in the season, and grown on in heated pits, will now be yielding supplies. Those that are to follow for succession should now be planted outside, giving them a little protection for a few nights with handlights or cloches. Still continue to fertilise the blooms of those plants that are growing in heated structures.

CAPSICUMS. — Continue to pot these as they require it; 7-inch pots are a fair size for them to fruit in, using sandy loam. Keep them growing in a buoyant atmosphere, which will assist in keeping them clean.

GENERAL WORK.—Keep the hoe at work on all favourable occasions between growing crops, such as onions, carrots, and turnips; it seems to help them on amazingly. Take lights entirely off young carrots, and potatoes, peas, etc., in the day time, and give them plenty of water at their roots when they become dry.—T. W. Birkinshaw, Hatley Park Gardens, Sandy, Beds.

THE MAY FLOWER.

One of the prettiest trailing plants for the rock garden or sheltered shrubbery is the American May flower (Epigæa repens), a plant that is so remarkably easy to grow that one can recommend it to the veriest amateur as a shade-loving subject he can successfully manage. It is rare in gardens, not on account of any cultural disability, for there is none of this, but on account of neglect to make use of it in the best possible way. The leaf and stem system is practically that of Euonymus radicans—prostrate growths, minutely hairy throughout, thickly studded with oval leaves an inch or two long. The trailing growths terminate in the daintiest of white flower trusses, miniatures of orange blossom really, and of snowy-whiteness, the centre of each five petalled flower being filled by a ring of raised white filaments that recalls velvet pile.

There is nothing ornate or gaudy about the plant at any time, but a measure of refinement in every leaf and petal that appeals to one's artistic sense very strongly. This is not all, however, its fragrance, literally spiced hawthorn, is singularly sweet, and on this account alone one could welcome its presence in the spring garden. It delights in a root run of leaf-soil and peat, and its shade-loving nature is fully satisfied by its being planted as a carpet for rhododendrons of the ferrugineum type, the conditions of growth being identical for both plants. In the absence of shade, cool conditions at the root must be maintained, and a soil consisting almost wholly of peat afforded it.

G. B. Mallett.

NEW BOOKS.

◆

THE BOOK OF WATER GARDENING.

By Peter Bisset (A. T. de la Mare Printing and Publishing Company, New York).

Within recent years water gardening has attained to a high degree of popularity in America, as in this country, and as the result, the cultivation of aquatics and moisture-loving plants generally has been greatly extended, both in public parks and gardens and in private establishments. There is probably no feature of greater interest in the garden, or one that is capable of giving greater pleasure to the owner thereof, than a judiciously made collection of aquatics so arranged as to display their distinctive charms to the best advantage. Many owners of gardens, realising this, have had well-appointed water gardens added to the pleasure grounds, while a still larger number are actively engaged in the development of streams, ponds, and other water areas with a view to their utilisation in the cultivation of such plants as thrive in or on the margins of water.

In the United States the extension of water gardening has proceeded rather more rapidly than in this country, and this may perhaps be attributed in a large measure to the great difference in the climatic conditions that obtain in the two countries during the summer months. In America the summers are invariably hot and dry, while here the temperature is lower and the amount of atmospheric moisture much greater, and water and the vegetation belonging thereto have greater attractions to most persons in hot, dry weather than in weather that is cool and moist. Moreover, the high temperature experienced in America during the summer renders the cultivation of some tropical water lilies in the open possible without the necessity of warming the water in which they are grown by artificial means.

The handsome volume now before us is one of the best proofs of the interest that is being taken in water gardening in the United States, and it also affords abundant evidence of the thorough acquaintance by the author with the characteristics and the cultural requirements of the plants necessary in the equipment of a water garden of the highest class. In the opening chapter the author gives a sketch of the history and development of the water lilies, and writes in eulogistic terms of their manifold charms. He then proceeds to deal with the formation of ponds and basins for their cultivation, and with reference to the most suitable site, writes: "In selecting the location of a pond or pool in which to grow water lilies, the ground should be gone over carefully, and a site chosen where a supply of water, either from a natural stream or from an artificial source, will be provided. The location should, if possible, be sheltered by buildings, by a planting of trees and shrubs far enough away from the edge of the pond that they will not overshadow the water, or by a high bank on the north-west, north-east, and north, but open toward the south, south-west, and south-east. This will ensure the full benefit of the sun's rays in warming the water, and at the same time afford protection from high winds that would soon ruin the tropical growth of the tender water lilies and the subtropical plants in the surrounding borders. If the pond is intended for the growth of hardy kinds only, it will not be necessary to protect it, as these will thrive in a much lower temperature than the tender ones, and the leaf surface of the hardy sorts is so small that they are never seriously damaged by the wind." Of the excellence of this advice there can be no question, and what is true in America is in a large degree true in this country.

Having thus briefly described the most suitable site for the water garden, Mr. Bisset proceeds to give full directions for preparing existing streams, ponds, and other water areas for the water lilies and other suitable forms of plant life, and for the formation of new ponds and streams to be supplied with water from natural or artificial sources. In advising at some length on the preparation and planting of ponds and basins suitable for gardens of various classes, Mr. Bisset does not overlook the requirements of those who for various reasons have to limit their cultivation of water lilies and other aquatics to a few tubs placed in sunny positions in flower or kitchen garden; but gives advice on the best methods of procedure in tub culture.

There would, indeed, appear to be but few, if any, details in the making and management of a water garden that have escaped the attention of the author, and the advice is throughout that of a practical cultivator, and therefore thoroughly trustworthy.

The book is profusely illustrated with finely-executed engravings, which serve to elucidate the text, and to contribute materially to the attractions of its pages. As a text-book on the subject with which it deals, Mr. Bisset's work has our heartiest commendation.

CULTIVATION OF THE PERPETUAL-FLOWERING CARNATION.

By C. H. Taudevin. (Young and Co., American Tree Carnation Specialists, Hatherley, Cheltenham.) Price, 1s. net.

Having regard to the high degree of popularity to which the perpetual-flowering carnations of the American type have attained, it is of much importance that cultivators should have at their command information that is at once concise and trustworthy. Hence the neat and essentially practical book that has been published by Messrs. Young and Co. is especially welcome. Mr. Taudevin describes in clear language the various details to which growers have to give attention to ensure success, and also gives an excellent calendar of operations for the year.

A COMPENDIUM OF THE AGRICULTURAL HOLDING ACTS.

By Walter de Houghton Birch, F.S.I., F.H.A.S. (The Country Gentlemen's Association, Lim., 24 and 25, St. James' Street, S.W.) Price, 2s. net.

This compendium of the Agricultural Holdings Acts, 1883 to 1906, has been arranged to enable the several Acts to be read concurrently, which is impracticable in their original form, owing to the constant reference to the earlier Acts, and should prove of much value to both farmers and market gardeners. The contents include the titles, scope, and general application of each Act, and compilation of the Acts. There is also an excellent index.

APPLE FRENCH CRAB.

With reference to the letter of "Straffan" relating to the apple French Crab, which appeared in the Gardeners' Magazine of the 11th ult., we are writing to say that we are glad you directed attention to the fact that this variety is not distinct from Northern Greening. We are also pleased that you quoted the late Dr. Hogg in support of your views, for he was undoubtedly the greatest authority on apples. We would at the same time mention that the apple catalogued by us as French Crab is the same variety as that mentioned by your correspondent, and that we have repeatedly had fruits hanging on the trees in our nurseries till well into the winter.

W. Seabrook and Sons.

Fruit Tree Nurseries,
Springfield, Chelmsford.

Maize.—In some establishments this vegetable is in great demand, and to produce fine cobs it is necessary to choose a deep rich soil, so that the growths may develop to their fullest extent without any check. Sow the seeds at once in rows about 2ft. apart, and thin out, when they have germinated, to 1ft. apart, and if the summer is favourable to their growth good dishes will be given in the autumn.—T. W. Birkinshaw.

THE PROFESSION OF LANDSCAPE GARDENING.

At the afternoon meeting of the Royal Horticultural Society, held on April 28, Mr. Edward White, the eminent landscape gardener, gave a lecture, at once interesting and instructive, on the all-important subject of "The Profession of Landscape Gardening." He said: I will not take advantage of the wide scope for observation which the title of my paper seems to offer, but propose simply to consider in a few aspects the profession of landscape gardening, literally, as a vocation.

I believe there is enough interest in the calling, and sufficient mystery as to the means by which essential knowledge of it can be acquired, to justify a few reflections. In Vincent Square an attempt to define the mission of the landscape gardener would appear an impertinence. No one present is so ingenuous as the lady who thought the term a complimentary description of persons who tidied up gardens. The designation, however, is cumbersome and inadequate, and it is a pity that one cannot find a short and comprehensive substitute.

In spirit, at all events, we here are all landscape gardeners, and much too zealous to allow our conceptions to be confined by garden and park enclosures. We are stimulated by our appreciation of landscape scenery and anxious to bestow its beauties upon districts where they are non-existent, and, in short, if I may parody that well-worn phrase, to break down the fence and make all nature a garden. Closely associated with the desire is the idea cleverly crystallised in the expression "garden cities."

A town or city should no longer signify the compression of the largest number of dwellings into the smallest possible space. Neither is what it should be without the adornment of tree-planted streets, and parades, in addition to parks, recreation, hospital, and other grounds. In fact, you expect that practically every corner of public land, if not already picturesque, shall be subjected to ornamental treatment. The proportion of town areas committed to the care of gardeners is, therefore, happily becoming very considerable, and it is of extreme importance that the whole matter should be under professional direction. But while the assistance of Nature is being successfully enlisted to relieve the oppressiveness of bricks and mortar in towns, the builder is taking full revenge by his invasion of rural retreats.

Life in the country has become fashionable largely at the expense of much of our best landscape scenery, especially as it is coupled with a desire for the pure air of the more elevated places, which are naturally the most conspicuous points of interest and beauty. The most beautiful districts available for occupation suffer most, and the attractions which tempted the first-comers to many of them are rapidly fading—indeed, the word Ichabod might well be added to advertisement boards standing on many a sylvan site.

The rate at which virgin country is disappearing is so prodigious that it would be most interesting to know the exact acreage which is annually withdrawn from a free state of nature. A moment's thought will help us to appreciate the extent of the diminution and to realise how much land is being cut up for new roads, and either lost to view behind garden fences, or, as may be sometimes worse, defiled and exposed in ugly disorder.

However regrettable may be the transformation of so much beautiful country, any protest would be puerile in view of the social development of which it is a symptom. We can only temper our regret with some satisfaction by insisting that where Nature is dispossessed it shall be succeeded by art worthy of the traditions of the site. Herein lies a legitimate opportunity for the landscape gardener. Sufficient proof can be furnished that the material advantages which result from expert artistic treatment justify it as a practical consideration.

For the landscape gardener there are problems of great interest involved in the preservation and use of features beautiful and natural, and their combination with technical details essential to the development of building property. Every road may become a vista of potential beauty, which may be accentuated, and not prejudiced, by the buildings for the service of which it is created.

The solution of the problem which will give such a result should be greatly aided by the conditions of spaciousness which appear to be necessities of the future. This is forecasted particularly by the proposals contained in the Town Planning Bill now before Parliament, which meets with sufficient approval to justify an expectation that in some form it will become law. It offers certain local bodies authoritative powers, hitherto unheard of in this country, over areas in their charge. It confers upon them the power to lay down the lines of new roads irrespective of intermixed ownership, and to enforce the execution of their own model plans of development, which will provide for such open spaces as are deemed necessary. One may be quite sure that lively controversies will result from the exercise of these powers, and may entertain the hope that æsthetic considerations will provide their share of debatable points, which can only receive due justice if they are represented by technical advisors who have devoted special study to the subject. There is some excuse for anxiety on this point when one remembers how often gentlemen, whose official engagements depend on their ability as civil engineers, are saddled with such extraneous responsibilities as the designing of parks and public gardens.

It seems only reasonable that municipalities desiring the luxury of artistic amenities—paid for compulsorily by ratepayers—should obtain designs from, and entrust the supervision of the work to, men technically educated to deal with such matters. It is no disparagement of some able men who hold municipal gardening appointments to say that the custom does not generally prevail. There are a few notable exceptions which greatly strengthen the case for a wide extension of the principle advocated.

In this direction there may be a considerable opening for the landscape gardener—but before it can be confidently demanded on his behalf, the public must be satisfied as to the existence of men fully qualified for the work. It is only if this condition can be secured that the object may be attained. The increased dignity and prestige which have attended the development of scientific and artistic gardening must facilitate such an end. Gardening ranks no longer as a mere hobby. It has developed into a great social factor. It is a nursery of art, and the school for the love of Nature. As a nation we admittedly prefer open-air amusement to artistic indoor pursuits. Gardening as an outdoor occupation therefore exhausts a large share of our æsthetic impulses—a share, indeed, so large that it is practically the national art.

Both the art and our country might be equally proud to represent the other. Art can scarcely require a better medium of expression than those living forms of vegetation which supply so many arts with their best material for inspiration. Although it is suggested that the garden is the school for the love of Nature, it is no paradox to say that the characteristic genius of English gardening receives an impulse from the recognition of the natural beauties of our country.

An English landscape gardener, whose work is to appeal truly to the mass of his fellow countrymen, in addition to his other qualifications, must have served a long apprenticeship in the school of Nature. The British Isles, thanks to their geological inconsistency, and to other advantageous peculiarities, offer for study, within the smallest radius, a wonderful variety of types of landscape beauty. The generosity of Nature in this country is emulated by many owners of beautiful gardens. Their gardens are freely opened to the student, the Press, and to the public, and by this means gratuitous lessons in horticulture and artistic effect are received, advantages resulting from, and only made possible by, great expenditure of time and money. Such liberality is the greater because all that is best is immediately seized for imitation, and, if possible, improved upon. It would not be inappropriate to allude to the educational facilities afforded by visits to the many splendid nurseries throughout the country, and to the courtesy and goodwill of their owners.

The opportunities for self-education offered to men who wish to follow the profession of landscape gardening are, therefore, numerous and varied, and at first sight it may appear that they are sufficient. Whether this be so or not depends entirely upon the ambition of the student, and the scope of action which contents him or her. If he desires to be self-reliant, and does not wish, for instance, to be continually referring to the architect, civil engineer, or surveyor, for technical assistance, he must be versed in such details of these sciences as are essential to his operations. It is exceedingly difficult, however, for a student to discriminate in the acquisition of knowledge of these details, and avoid wasting much time upon unnecessary matter. To a person whose temptation to embark on the career is solely the love of gardening, the idea of mastering two or three other pursuits seems appalling and unnecessary—unnecessary it certainly would be for him. The chances are that he will refuse to enter upon such subjects, and, that if he does not decide to abandon his aspirations he will devote himself to a system of gardening which affects to despise the so-called extravagances of constructional effort, and confine himself to a sphere of activity which is strictly limited.

It really seems unnecessary to emphasise such a point as the value to any young man of having his business education mapped out and directed by proper advisors, especially when he is preparing for a profession which discovers among its supporters such a large number of highly-skilled amateurs. Foreign critics of our educational methods might possibly recognise landscape gardening as our national art from the fact that it is practically untaught in this country.

(To be continued.)

LAW.

Nurserymen's Titles.

The case of Dickson v. Dickson recently heard in Dublin before the Master of the Rolls, was of considerable interest to the nursery and seed trade. In this case Messrs. Alex. Dickson and Sons, Lim., rose growers and seedsmen, of Newtownards, Belfast and Dublin, sought an injunction against Mr. Alexander Dickson trading as Messrs. Alexander Dickson and Sons, of Parliament Street, Dublin, and Woodlawn Nursery, Dundrum, restraining him from carrying on the business of nurseryman and seedsman in any style in which the name of Dickson appeared without taking reasonable precautions to clearly distinguish the business carried on by him from that carried on by the plaintiff company. At the close of the hearing, which extended over four days, the Master of the Rolls gave judgment in favour of the plaintiffs.

The Gardeners' Royal Benevolent Institution.—The 69th anniversary festival dinner in aid of the funds of this institution will take place on Wednesday, June 24, at the Hotel Metropole. The chair will be taken by the Right Hon. the Lord Aldenham. Subscriptions or donations to be placed on the chairman's list are earnestly solicited, and may be sent to Lord Aldenham, or to the secretary, Mr. G. J. Ingram, at the offices, 175, Victoria Street, Westminster, S.W.

HANLEY PARK, STAFFORDSHIRE.
July 1st and 2nd, 1908.
TWELFTH GREAT ANNUAL FLORAL FETE.
£650 IN PRIZES. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for
"TRADE EXHIBIT"
(for particulars see page 10 in Schedule).
Valuable SPECIAL PRIZES offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.
Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

WOLVERHAMPTON
GREAT FLORAL FETE.
July 7, 8, and 9, 1908.
£800 in prizes. Schedules on application.
W. E. BARNETT, Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, May 12.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Dr. A. Voelcker, Messrs. G. S. Saunders, H. T. Güssow, L. de B. Crawshay, J. T. Bennett-Poë, H. J. Elwes, W. C. Worsdell, E. M. Holmes, J. Douglas, and F. J. Chittenden (secretary). Visitor, Rev. A. E. Upcher, M.A.

MALFORMED NARCISSUS.—Mr. W. C. Worsdell reported that he had examined the malformed Narcissus Mr. J. T. Bennett-Poë sent to the last meeting by Messrs Hogg and Robertson, and found that the flower exhibited signs of fasciation, but this was only partial, since the perianth pieces were only nine in number, as were the stamens. There were, however, two completely formed ovaries, each with its full complement of three carpels. The style was somewhat flattened, and springing from its base was a branch which was probably a second style. This had become petaloid and tubular, and in the tube thus formed a third style had developed.

FASCIATION IN NARCISSUS.—Mr. J. W. Odell sent flowers of Narcissus Emperor which had been produced after all the normal flowers in the bed had died off, and which were fasciated, some having flattened stems bearing at the apex three flowers, each on a separate pedicel, others having the fasciation carried farther, so that the flowers themselves were coherent.

PELORIC CALCEOLARIA.—Mr. H. Tysoe, of the Lodge Gardens, Bedford, sent flowers of calceolaria showing regular peloria. All the flowers on the main branches of the inflorescences of two plants exhibited this phenomenon.

SEAKALE DISEASED.—Mr. H. T. Güssow showed a specimen of seakale which had become rotten, one of a considerable number in a plantation in Norfolk, which he said had been attacked by a bacillus, at present undescribed, differing in certain characters from Pseudomonas campestris. He considered that the attack of the organism upon the seakale had been made possible by the methods adopted in forcing the seakale, and that the attack might have been avoided if air had been admitted by raising the seakale pots somewhat above the soil level, so as to admit air.

INTUMESCENCE IN BRUGMANSIA.—Mr. G. S. Saunders showed a leaf of Brugmansia exhibiting small warty growths known as intumescences, a condition brought about usually by lack of a proper balance between the amount of water supplied at the roots and the humidity of the air, and a proper regulation of temperature.

AMARYLLIS SPECIES.—Mr. H. J. Elwes, F.R.S., showed a plant apparently allied to Amaryllis solandræflorum, but having a rose suffusion upon the perianth. The flowers are of very elegant form, and the plant appears to be very rarely met with in this country.

MORÆA IRIDIOIDES VAR. JOHNSONI.—Mrs. J. L. Richmond, F.R.H.S., of Woodlands, Lustleigh, South Devon, sent a flower and leaf of the very beautiful variety Johnsoni of Moræa iridioides. The flowers are considerably larger than those of the type or the variety Macleayi, and the foliage is upright instead of being fan-shaped; the bud was picked on May 7, and the flower was still almost perfect on the 12th. The seed from which the plant sprung was brought by a lady (Mrs. Johnson) from the mountains of Ceylon, where it had probably been originally taken from South Africa.

Royal Botanic Society.

A very pretty little exhibition was held on Wednesday, May 20, in the Royal Botanic Gardens, Regent's Park. The corridor was well filled, and the bulk of the display was made up of tulips in great beauty and variety, four fine groups of these handsome flowers being staged.

A glorious display of tulips was arranged by Messrs. R. Wallace and Co., Colchester, who in most cases put up three vases of a variety, and contrasted the colours well. A few of the finest of the hundred or so varieties shown were Gesneriana lutea, La Tulip Noire, Whistler, Inglescombe Pink, Painted Lady, Margaret, Calliope, Pride of Haarlem, the lovely yellow Mrs. Moon, Picotee, Fairy Queen, Zulu, Mr. Farncombe Sanders—one of the best, Hammer Hales, the beautiful pink Clara Butt, Gala Beauty, Maiden's Blush, Afterglow, and Anthony Roozen.

Messrs. Wm. Paul and Son, Waltham Cross, contributed a large group of roses in pots, chiefly pillar and rambling varieties, all in good form. Conspicuous in the centre were the specimens of the free, large-flowered Tausendschon, carrying numerous pendant trusses of deep pink blooms; around this were other rambling varieties, such as Grace Thomson, a new soft red variety with dull white centre; Hiawatha, Claire Jacquier, Crepuscule, the free single-flowered Kathleen, the popular Lady Gay, the new Paradise, an elegant starry flower, almost scarlet when first opened, but fading to pale pink; and Stella, Eugenie Lamesch, Aennchen Müller, Grace Darling, La France, Gloire Lyonnaise, Dora, and Senateur Belle, were other roses well shown in this group.

Tulips were also largely shown by Messrs. R. H. Bath, Lim., Wisbech, who had a very bright exhibit, consisting of a fine assortment of Darwin and cottage varieties; Maiden's Blush, elegans alba, Gesneriana major, Gesneriana lutea, Prince of Orange, Mrs. Moon, Isis, La Tulipe Noir, Isabella, and Inglescombe Pink were among the best varieties staged. Mr. J. Williams, Oxford Road, Ealing, showed table decorations in yellow irises and trollius blooms.

A prettily arranged rockwork group was set up by the Misses E. and M. Kipping, Hutton, Essex, and in it were some charming violas and pansies, alpine phloxes and aubrietias, Cheiranthus alpinus, Anthemis aizoon, saxifragas, Aster alpinus, polemoniums, etc. The Misses Hopkins, Mere Gardens, Shepperton, contributed a small collection of rockery plants, such as Saxifraga pyramidalis, Cheiranthus alpina, Primula Sieboldi, Phlox canadensis, Incarvillea grandiflora, I. Delavayi, Dryas octopetala, etc.

A bold group of bright tulips came from Messrs. Hogg and Robertson, Mary Street, Dublin, and it included handsome bunches of Gesneriana forms, Laurentia, Millet, the golden Mrs. Jas. Robertson, Bartigon, Glory, [illegible], Caledonia—very bright scarlet, Mrs. Moon, Loveliness, Bouton d'Or, Isabella, Hecla, Fairy Queen, Calypso, and other handsome varieties.

Messrs. Barr and Sons, King Street, Covent Garden, contributed a bright display of tulips, setting up large vases of such handsome varieties as Louis XIV., Golden Glow, Leghorn Bonnet, Picotee, Inglescombe Pink, Chameleon, Mauriana, The Dove, Fairy Queen, Margaret, Mrs. Moon, Sunset, La Merveille, Orange Beauty, and Landelle. With the tulips, the Messrs. Barr showed irises of the germanica type, I. Susiana, the new I. Hecate, Ranunculus aconitifolius fl. pl., single pæonies, and trolliuses. Messrs. John Peed and Son, West Norwood, S.E., made up a group of Japanese maples, associating these with clematises and yellow arum lilies.

MEDALS.

Large Gold.—Messrs. R. Wallace and Co., Colchester; Messrs. Barr and Sons, Covent Garden.

Gold.—Messrs. Hogg and Robertson, Mary Street, Dublin; Messrs. Wm. Paul and Son, Waltham Cross.

Large Silver-gilt.—Messrs. R. H. Bath, Lim., Wisbech.

Silver.—Mr. Williams, Oxford Road, Ealing; the Misses Kipping, Hutton, Essex; Messrs. J. Peed and Son, West Norwood.

Bronze.—The Misses Hopkins, Mere, Shepperton.

AWARDS OF MERIT.

Awards of Merit were made in favour of Rose Paradise, a new single-flowered rambler, from Messrs. Wm. Paul and Son, Waltham Cross; Tulips Afterglow, Psyche, and Millet, from Messrs. R. Wallace and Co., Colchester.

British Gardeners' Association.

At the monthly meeting of the B.G.A., held on May 12, with Mr. Chas. Foster in the chair, seventy-eight new members were elected, and two candidates were declined. Questions affecting the payment of wages due to a Northampton member, and the alleged grievances of men at Kew, were considered, and will come up for further report. Arrangements were made for the annual general meeting, which will take place at the Essex Hall on Wednesday, May 27, at seven p.m. A very large meeting is anticipated.

LONDON BRANCH.

In spite of inclement weather, a large number of gardeners attended the meeting of the London branch at Carr's Restaurant, Strand. It was announced that the committee had decided that monthly visits be made to parks and gardens, with an appointed leader, during the recess. This met with general approval. Further business having been transacted, the important item of the programme was the address by Mr. T. Winter, superintendent of the Marylebone public gardens. Although the subject—"Construction of Public Parks and Gardens"—is a wide one, it was ably dealt with by the lecturer, under several headings. The locality was important, and it was always necessary to consult the local authorities concerning drainage and other matters, as connections have often to be made with main drains. Preparation of the ground, its nature, whether undulating or comparatively level, extent, and shelter afforded by existing trees and shrubberies, were all discussed. Tile drains were recommended as the best and cheapest to use. Although expensive in the initial outlay, it was very necessary the making of carriage drives should be well done. A road ought not to skirt the edge of the grounds, neither should its lines have meaningless curves. In excavating for a road the nature of the subsoil must be considered. Where the lower strata is fairly firm, 9in. of hard core on this, and a 6in. layer of flints, finishing with a good thickness of fine gravel, would make a road which would look and wear well. Walks should join a road with an easy curve. They are often made too narrow. Straight walks should be avoided, but at the same time the object of a curve should be easily seen. In the preparation of ground for lawn seed, Mr. Winter said he preferred the surface to be trodden rather than rolled.

Previous to planting, the ground should be well trenched for the reception of trees and shrubs. In giving a list, the lecturer said that rhododendrons ought to receive more attention. In conclusion, Mr. Winter dwelt upon the benefits conferred upon the public by having large parks and open spaces.

In the discussion which followed there was no lack of speakers. The chairman, Mr. Hawes, allowed each speaker as much time as possible. Messrs. Lewis, Frogbrook, Hill, Lock, Harding, W. B. Little, Cresswell, and Summerfield raised various points which were subsequently dealt with by the lecturer. Mr. J. Weather (general secretary) made some forcible remarks, concerning the butchering of street trees in some localities. Other points which he gave brought up Mr. Barnes, of Southwark Park, who ably responded.

A hearty vote of thanks was given to Mr. Winter for his excellent address, and a similar one having been given to Mr. Hawes for presiding, the proceedings closed.

LEEDS BRANCH.

A meeting of this branch of the B.G.A. at the Grand Central Hotel, Briggate, was recently held. Mr. Campbell, Methley Park Gardens, presided. There was a good number of gardeners present.

Mr. Clayton, of Ullerskelf, near York, was the lecturer for the evening, the subject being "Gardeners and Gardening." In dealing with the subject, Mr. Clayton made reference to the working of large gardens with garden labourers or permanent garden hands versus the usual army of journeymen. Although the lecturer was in favour of a permanent staff, much discussion was raised and many useful items given for and against both systems. Mr. Clayton also dealt with the training of the young gardener, and gave much valuable information bearing on the method of procedure. A good discussion followed, after which Mr. Clayton was accorded a hearty vote of thanks.

The committee of the local branch intend to make the above address their headquarters, and to hold during the summer months bi-monthly meetings. The next meeting will be held on Saturday, July 4, when Mr. John Donoghue, Bardon Hill Gardens, Leeds, will give a lecture on "The Carnation: Its History and Cultivation." Many varieties of this popular flower will be exhibited at the meeting. All gardeners are invited.

Croydon Gardeners' Association.

The eighth annual spring flower show of this society was held at the Horniman Hall, Croydon. The committee endeavours to foster a love of horticulture in all, and through the generosity of the society's supporters is able each year to give free admission to the general public to this early exhibition. Needless to say, the number of visitors attending is very great, and from the time the show opens at three o'clock till it closes, about ten, the hall is full. No prizes are offered to the exhibitors, so that they are to be complimented on the enthusiasm they display in making the affair a success.

From the gardens of the president, Mr. J. J. Reid, came a grand exhibit of schizanthuses, azaleas, and mignonette, reflecting great credit on his head gardener, Mr. F. Oxtoby. Mr. J. Pascall's gardener, Mr. A. Edwards, had a miscellaneous group of plants, including well-grown calceolarias and double cinerarias. Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham, put up some good hippeastrums and caladiums. In one corner Mr. J. J. Pittman's gardener, Mr. A. Dyer, staged an effective exhibit of Cineraria stellata, cyclamen, and white stocks. Sir Walpole Greenwell sent cut flowers, including double and regal pelargoniums, cypripediums, and two fine sprays of Cymbidium Lowianum, which his gardener, Mr. W. Lintott, very effectively arranged. A very fine azalea came from Mrs. Matthew's garden, Anerley, and her gardener, Mr. C. Thrower, evidently understands the cultivation of this class of plant, for it was a mass of flower measuring about 2 feet 6 inches across.

A pretty exhibit was made by Mr. Wateridge, gardener to Otto Hehner, Esq., with Cineraria stellata in good colours and vigorous plants. Mr. Frank Allen's spiræas and hippeastrums were also much admired, and the society welcomed a new exhibitor in his gardener, Mr. Beacon. Two cottagers contributed exhibits, Mr. J. R. Filce bringing some well-grown auriculas, and Mr. R. Cleveland a collection of cacti.

The trade was well represented. Messrs. J. Peed and Son, West Norwood, had a collection of alpines arranged in boxes, and these, with a few carnations, made an interesting exhibit. Alpines were also shown by Mr. J. R. Box, West Wickham, whilst the firm of Messrs. J. R. Box and Co. staged cut tulips and narcissi. Mr. P. Chaff arranged a miscellaneous group of plants, and the stage was tastefully decorated by Mr. T. Butcher. Messrs. E. W. and S. Rogers had a table of hyacinths, including the best varieties, all of them bearing very fine trusses.

United Horticultural Benefit and Provident Society.

The usual monthly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on Monday evening last, Mr. Charles H. Curtis in the chair. Five new members were elected, and one nominated. The death certificate of a member was produced, and the amount standing to his credit in the books was ordered to be paid to his nominee. The amount paid for sickness during the month was £25 12s.

The sick pay from February to May, 1907, amounted to £199 11s., but for the corresponding period this year it was but £154 8s., a reduction of £45 3s. At the present time there are five chronic sick and five other members on the sick fund. The annual report and balance-sheet has been posted to all honorary and benefit members. Any member not having received one will please notify the secretary.

East Anglian Horticultural Club.

Although the elements were not favourable, a large gathering of members assembled at the May meeting of this club, held at the Boar's Head, Norwich, on the 14th inst. Mr. J. Powley presided, and among those present were Messrs. T. B. Field (Ashwellthorpe), L. Smith (Shotesham), H. Goude (Old Catton), E. Peake, W. Chettleburgh (Worstead), J. Forder (Messrs. Daniels Bros.), Mr. T. G. Bishop (Messrs. Daniels' Nursery), H. Perry, and W. L. Wallis, secretary.

As no paper had been received in the essay competition, Mr. H. Perry suggested an impromptu discussion upon the subject of "Insecticides," and led off with a query as to the best way of mixing paraffin and applying it. Mr. H. Goude gave a useful formula and how to prepare same, adding some very useful remarks. Mr. L. Smith gave some practical suggestions, and Messrs. J. Clutsom, E. Peake, R. Watson, C. Hines, and others, also contributed to the discussion. By this means an interesting evening was spent.

It was decided, if permission can be obtained, to visit Lord de Ramsey's garden at Haverland Hall, and from thence to Blickling Hall, on the occasion of the summer outing of the club, on Thursday, July 16.

The exhibition for the evening contained a varied assortment of good things. Among the non-competitive subjects were some twin-flowered Narcissi King of Spain from Mr. W. Chettleburgh, Worstead; some sprays of Piptanthus nepalensis from the nursery of Messrs. Daniels Bros., Lim.; roses from Messrs. Hobbies, Lim., Dereham; and some good streptocarpus blooms from Mr. E. Goldspink.

Included among the competitive exhibits one noticed a plant of the charming Phlox divaracata from Mr. F. Willing, gardener to F. Bainbridge, Esq., Hethersett, which is so useful for spring bedding. The pods of Daniel's dwarf prolific pea, shown by Mr. E. Grand, gardener to J. Wilson Gilbert, Esq., Cringleford, were as good as one could wish for, and proved the merits of this variety for early use. Apples and strawberries maintained the reputation of the fruit section, whilst the cut flowers of Mr. W. Palmer, gardener to J. B. Coaks, Esq., Mr. F. Williams, gardener to Louis Tillett Esq., M.P., and Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, were splendid arrangements. Pot plants and vegetables also added their quota to the exhibition.

Commons and Footpaths Preservation Society.

At the monthly meeting of the Commons and Footpaths Preservation Society, with Lord Eversley in the chair, it was reported that the owners of over 6,000 acres of land in the neighbourhood had already assented to the society's scheme for the regulation of Towyn Trewan Common, Anglesey, a tract of 1,300 acres of open land situate at Rhosneigr, near Holyhead, and that the Board of Agriculture had now issued a draft order for the regulation of Maidenhead Thicket and Cookham Commons, Berks. The Chairman stated that a joint deputation of the Verderers of the New Forest and the society had been received by Mr. Haldane on the subject of the proposed holding of extensive military manœuvres in the Forest in August and September next, and that the War Office undertook to enter into an agreement embracing all the safeguards which the public would have enjoyed if the manœuvres had taken place under the provisions of the Military Manœuvres Act, 1897. The Secretary announced that the Ludshott Common and Waggoners Wells purchase fund amounted, with guarantees, to £1,654, leaving £150 to be raised to complete the purchase of 560 acres of moorland on the borders of Hindhead.

TRADE NOTE.

The latest invention to aid the gardener in baffling his natural enemies, the birds, is Hewett's Patent Webber. This little apparatus, which is not unlike a miniature fishing rod in appearance, enables an entirely unskilled person to cotton a fruit bush in about a minute at a cost of less than a farthing for material. What has always been regarded as an unpleasant and unsatisfactory operation is rendered easy and effective with Hewett's Webber, and the centre of the bush, which is generally left untouched when the work is done by hand, can be quite protected from the attack of birds. Seed beds are equally protected by means of this webber, and a few odd pieces of stick, and a perfect network of cotton can be placed over a bed in a minute or so. It is the neatest and most effective thing of the kind we have seen, and its inexpensiveness should ensure a brisk demand. Mr. Hewett's address is 16, Avenue Road, Winchester.

FORTHCOMING ENGAGEMENTS.

MONDAY, May 25.—Linnean Society Anniversary Meeting.

Kew Guild Annual Meeting, 6.30 p.m., and Dinner, 7.30 p.m., at the Holborn Restaurant.

TUESDAY, May 26.—Great Temple Show; three days.

WEDNESDAY, May 27.—Bath and West and Southern Counties Show; five days.

British Gardeners' Association; Annual Meeting at Essex Hall, Strand, W.C.; 7 p.m.

Hayward's Heath Gardeners' Outing to Abbotsleigh

ANSWERS TO CORRESPONDENTS.

PLANTS FOR A SHADY BALCONY.—S. R. B., Thame.—You must be content wi foliage, chiefly, as comparatively few plan yield a display of bloom under shady con tions. The better hardy ferns, Aralia boldi, Creeping Jenny, fuchsias, m Cobæa scandens (climber), and Runner bea may all be pressed into service, and there ar funkias, anthericums, and Solomon's Seal. few palms that have been well hardened m be used during the summer, and a few flow ing plants in pots or tubs should be brough from sunnier positions to sojourn aw among the flowerless plants. By the exercise of a little ingenuity, and the expenditure of a little labour the shady balcony may be kept beautiful all the summer.

MAGGOTS IN RASPBERRY SHOOTS.—R. S., Birmingham: The trouble is due to a rather severe attack of the raspberry stem-bud caterpillar (Lampronia rubiella). This little pest is unfortunately all too well known in market garden districts, from the southern counties of England almost to the [illegible] midlands. The little red maggots, each with a tiny black head and small black tail spot, are readily recognised once they have been identified. These caterpillars or maggots live through the winter, and early in the spring they pierce the raspberry leaf-buds, eating out the centre or pith, so that directly the weather induces the shoots to elongate they fade, and by hanging limp show prompt evidence of the damage done. A close inspection of the canes in early spring will be the means of discovering many of these little red caterpillars, and a boy might profitably spend an hour or two each day capturing and killing the pests, because it has been proved that, after emerging from one bud they pass on to attack others, consequently inspection should be made directly the buds show signs of bursting. The moth lays her eggs in the newly-opened raspberry flower, and here they hatch and live, until by the time the fruits are ripe the caterpillars are full fed, and they spin themselves a cocoon and remain therein for the winter. Hunting the caterpillars and removing and burning all infested shoots should be done at this season or earlier. In the winter, after the leaves have fallen and the old canes and unnecessary new ones have been cut out, remove as much of the surface soil as possible, and put some rich garden soil in its place. The old soil should be buried deeply, or treated with fresh gas lime, to kill the hibernating caterpillars. Very early in spring frequently dust the canes with soot and strew soot around the plants so as to make everything as distasteful as possible to any caterpillars that may have escaped the winter treatment.

SPORTING AMONG TULIPS.—E., Chippenham: It is by no means an uncommon thing for tulips to sport, although an inspection of the splendid stocks of bulbs in Eng lish, Irish, and Continental nurseries [illegible] hardly lead one to suppose it was anything but an unusual circumstance. The [illegible] Cottage Boy is a sport from the [illegible] Cottage Maid. We saw recently [illegible] sports in a batch of Lion d'Orange. There [illegible] no good reason why the white flower [illegible] not be a sport from the yellow one. [illegible] the bulb carefully, and lift it in due [illegible] planting it again early in an isolated [illegible] tion. It may prove to be like some [illegible] white variety, and consequently only [illegible] interesting variation; on the other hand [illegible] may have a distinct commercial value [illegible] flowers are pure, substantial, and [illegible]

DISEASED TOMATOES.—J. R., W[illegible]stow: The plants are suffering from [illegible] bad attack of tomato rust (Cladosp[illegible] vum), a fungus pest that frequently [illegible] the leafage, and sometimes the fruits [illegible] toes. Too generous treatment [illegible] plants during ungenial weather, [illegible] if the plants were weakened at all [illegible] seedling stage, is the chief cause [illegible] disease, consequently a buoyant atm[illegible] such as ventilating during the present [illegible] weather will produce, will materially [illegible]

WEST'S PATENT GARDEN SUNDRIES

SAVE, & LABOUR EASE,

Have been invented during 25 years of practical experience in horticultural sundries, that by the better cultivation of plants and the pleasure by which gardens are kept in order their expense is doubly repaid.

ORDER FORM. *(Address here.)*

(To be filled up and handed to your Seedsman to execute for free delivery, thus saving carriage.)

To Messrs. Kindly supply the following:

WEST'S PATENT GARDEN SUNDRIES.

Qunty.		£	s.	d.
,,	**Rafflatape,** coils better than raffia. 1d. coil ties up 150 plants. 7 coils (100 yds.) for **6d** ...			
,,	,, reels, with holder to fasten in buttonhole, 250 yds., complete **1/6** each			
,,	**Wall Tree Fasteners,** indestructible. Fastens on and off any nail in a wall, 50 for **6d.** ...			
,,	**Powder Fumer and Spray Syringe,** most useful syringe for all purposes, **6/-** each			
,,	**Nicofume.** Complete self-contained fumigator, holding ½oz. 95% nicotine, **6d.** ea., **5/9** doz.			
,,	**W.E.O.N. Insecticide.** Sold under a £20 guarantee. 6d. bottles **5/9** doz., **14/-** pint. ...			
,,	**Fumigator.** Copper cup, complete, **9d.**			
,,	**Hand Fumigator** (prevention is better than cure), 2/9 each			
,,	**Powder Diffuser.** Filled with tobacco powder (easily re-filled), **6d.** each			
,,	**Tobacco Powder.** Specially prepared (introduced 1888), **6d.** per tin			
,,	**Westite.** The first and best slug and germ killer, **6d.** per box to **20/-** cwt.			
,,	**Beetle Killer Powder.** Death to woodlice and all beetles, **6d.** per tin			
,,	**Plant Pot Crocks.** For perfect potting, prevention of insects into pot, etc., **2/9** per 100 ...			
,,	**Fertiliser.** Perfect plant food. Has stood the test for 20 years, **6d.** per box to **20/-** cwt.			
,,	**Watering Can Spreaders.** Fits any watering can and gives a splendid spray, **3d. each** ...			
,,	**Weeder.** Saves weary weeding, for a lady can uproot hundreds of weeds per hour, **2/6** ea.			
,,	**Lawn Sand.** Has stood the test for 25 years, and now improved, **6d.** per tin to **20/-** cwt.			
,,	**Weed Killer.** Best and cheapest for killing weeds on walks, etc. Introduced 1888. **1/6** tin			
,,	**Aluminium Labels.** When written on with lead pencil the wording is legible and indelible. Founded on the 25 years' experience with the West's Patent Label. **1/6, 2/- & 3/-** per 100			
,,	**Layering Pegs** and **Verbena Pins, 9d.** per 100			
,,	**Greenhouse Shading.** Introduced in 1888 and still the best. Green and cream, **9d.** box.			
,,	**Garden Cuffs.** Keeps the coat cuffs clean. No gardener should be without them, **6d.** pair			
,,	**Flower Holders.** For button holes and ladies' sprays. The flowers are gripped and held in watertight nickel tube, so that the lady's may be worn downwards { Gent's, **7½d.** Lady's **10d**

and strengthen the plants. Remove and burn all the badly infected plants, and also cut away and burn the diseased leaves on other plants. Spray the plants left, and also the soil, walls, and woodwork, with a weak solution of potassium sulphide—one ounce of sulphide to three gallons of water, dissolving the sulphide (liver of sulphur) in hot water before making up the desired quantity with tepid water. After this, fill up the vacant places with healthy plants from a new source and spray the whole houseful of plants once a week until the fruits are of some size. The potassium sulphide solution ought always to be used upon quite young tomatoes where there has been a fungus attack of any kind during the previous season, as it is a splendid preventive. Liver of sulphur should always be kept handy, not in large quantities, in an air-tight glass or earthenware jar, ready for the slightest appearance of disease. All too often diseases are allowed to obtain a hold upon plants before remedial measures are adopted, and in comparatively few places are preventive measures taken.

CATERPILLAR OF THE MAGPIE MOTH.—S. E. J., Cork: The caterpillars of the magpie moth feed upon gooseberries and red and white currants, eating the young leaves. They usually appear towards the end of May, or during early June. They are not difficult to catch, though they have a habit of dropping smartly to the ground or to a lower branch if disturbed. Smartly tapping the bush will dislodge them, and if the soil beneath the bush is raked clean and level the caterpillars can be easily seen as they fall, and a spade back will put an end to them. The caterpillars feeding now will, if permitted, spin cocoons as soon as full fed, and from these the pretty magpie moths with their black spotting on a cream or white ground, emerge about the middle of the summer, lay their eggs, and the resulting caterpillars winter among the fallen leaves, rough soil-clods, or in the shelter of fences, etc. The value of carefully cleaning a plantation after the leaves have fallen will be obvious.

SELF-SOWN TROPÆOLUMS.—M. B., Malton: Although tropæolums are tender annuals, it is of quite common occurrence for self-sown seedlings to appear in spring where plants were set out the previous year. These seedlings seem to understand the possibilities of the season, and rarely do they appear early enough to fall a prey to late frosts. If the plants are conveniently situated, do not disturb them, but if not, then transplant them where you wish them to flower. We had a piece of new trellis covered with Tropaeolum canariensis last summer, and a very beautiful feature this was, with the golden flowers shining amid the elegant and delicate green leafage; now, all along the base of the fence young tropæolums, varying in height from one to six inches, are abundant, and they will have to be severely thinned out directly.

SEEDLING CYPRIPEDIUM.—T. B., West Dulwich: It may seem unkind to suggest that the baby you have watched over so carefully for several years should be promptly consigned to the flames, but really that is the best thing we can advise you to do with it. There are so many beautiful and useful species of cypripediums, and a whole host of hybrids, many of them fairly cheap now, that it is not worth while giving house room to worthless seedlings. The flower sent is small, and has a badly reflexed dorsal sepal; moreover, it has nothing attractive in its colouring. Keep it another year if you wish, and then, if it flowers no better, destroy it. Do not destroy the other seedlings until they have flowered, because the fact that the first to flower is worthless does not prove that the others will be also.

THE
TEMPLE SHOW,
LONDON.

A FULL ILLUSTRATED REPORT
OF THE GREAT EXHIBITION, to
be held by the Royal Horticultural Society,
in the Inner Temple Gardens, London, on
May 26, 27, and 28, will be given in the
GARDENERS' MAGAZINE,
May 30 and June 6.

Price 2d. each number, by post 2½d.

Offices:—148 & 149, Aldersgate Street, London.

NAMES OF PLANTS.

W., Gerrard's Cross.—Anemone fulgens.

MARPOOL, Exmouth.—Sambucus racemosus.

H. M., Ware.—1, Anthericum liliago; 2, Nephrolepis tuberosa; 3, a form of Pteris tremula; 4, Cupressus funebris.

W. X., Bridgewater.—1, Epimedium pinnatum; 2, Genista hispanica; 3, Iberis gibraltarica; 4, I. sempervirens; 5 and 7, garden forms of Helianthemum vulgare; 6, a geranium, send when in flower; 8, Phlox setacea; 9, Potentilla alba; 10, Alyssum saxatile fl.-pl.

H. S. C., Wicklow.—The specimen is a very poor one, but so far as we can make out it is Ruscus hypophyllus, a native of the Mediterranean region, from whence it was introduced in 1640. Its popular name of Double Tongue is suggested by the one small cladode growing out of the mid-rib of the larger one.

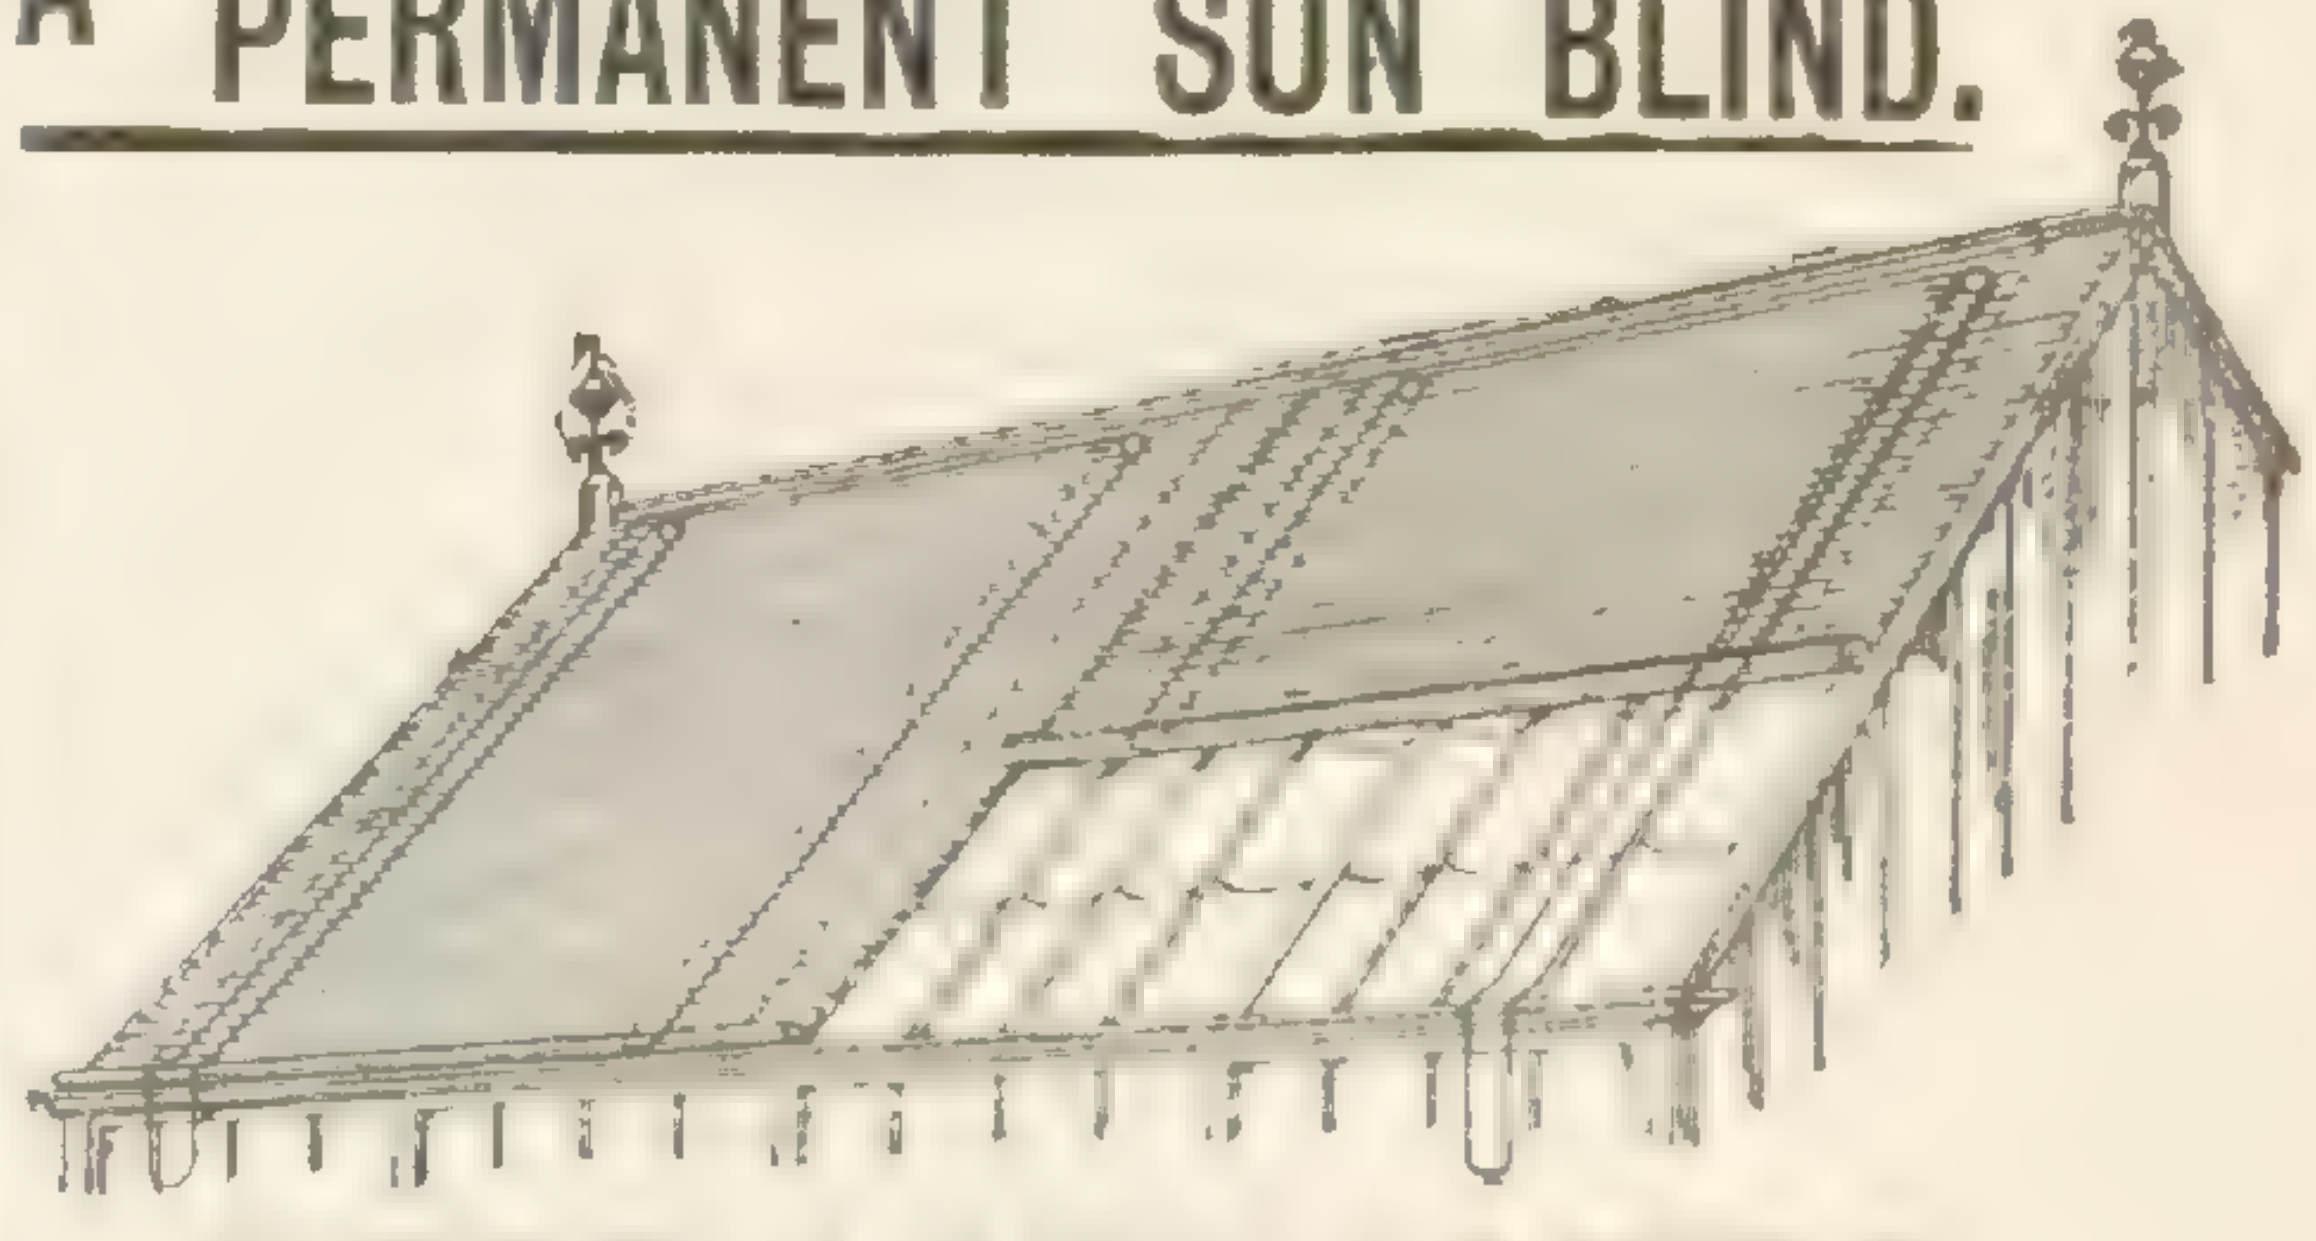
A PERMANENT SUN BLIND.



WOOD LATH BLINDS.

THESE blinds being made up with metal rings, and not with tapes or string, form a permanent and practically imperishable shading for glasshouses.

Flexible, easily rolled up, can be fixed and removed without difficulty, and form a protection against hailstorms.

When once adopted they always give satisfaction, both for economy and utility.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Temple Show.

The magnificent exhibition that has been held in the gardens of the Inner Temple during the past week was the twenty-first of the great horticultural gatherings that have been held in these historic gardens, and consequently possessed much interest apart altogether from its many attractions. The Temple shows represent perhaps the greatest revolution in horticultural exhibitions that has been made since they were established in this country. There have been many changes in flower shows since their institution, but these have for the most part been brought about by the changes in public taste and the endeavour made to adapt them, as far as possible, to the altered conditions. They underwent but little alteration in one respect; they were almost exclusively competitive. Classes were provided for specified collections and single specimens, with prizes proportionate to the importance of the objects invited, and these were competed for in accordance with the prescribed conditions. There were changes in the character of the exhibitions, but there was no material deviation from the practice of stipulating what the exhibitors should show, or of offering prizes as an inducement for them to contribute of their best. The practice of providing prizes at flower shows had indeed been so invariable that the announcement made by the Council of the Royal Horticultural Society, that they were about to hold an exhibition without specified classes and cash prizes came as a surprise. Not only were horticulturists surprised when the programme of the first Temple Show in 1888 was issued, but many horticulturists feared that an exhibition held under such conditions would fail to obtain a full measure of success. The results of the exhibitions held during the past twenty-one years have proved to demonstration that there was really no cause for fear either as regards the attractions and interest of the displays or the support of the flower loving public. We should have to go back many years to find exhibitions of any one society that have been so uniformly successful, and this exceptional success does not appear difficult of explanation. Exhibitions conducted on orthodox lines, while admirably adapted to local conditions, do not afford the same opportunities for presenting to public notice so great a diversity of plants and flowers, or of giving prominence to novelties as do the Temple shows, as at these exhibitors are practically free to show what they please. Hence the exhibitions have been most varied and interesting, and they have afforded facilities for becoming acquainted with much larger numbers of plants than was possible at the competitive gatherings. To over estimate the educational value of the Temple Shows would be impossible, and it appears difficult to conceive any other means by which so full a representation of hardy and tender ornamental plants could from time to time be brought into prominent notice. Neither would it be easy to devise any scheme by which gardeners in country districts could be more fully informed as to the trend of public taste than these annual gatherings afford; and that they fully appreciate their opportunities is made evident by the large numbers who annually make a point of "coming up to the Temple Show." We find in these shows also the best possible proofs of the great changes that have been made in the embellishment of the garden during the past two decades. In the earlier exhibitions, stove and greenhouse plants were largely represented, but now they are so sparingly shown as to form a relatively small part of the display. As a set off there has been so great an increase in the contributions of hardy plants and of their flowers in a cut state, that they would alone form an exhibition of no mean proportions and of immense interest. Still more noteworthy has been the increase in the exhibition of hardy trees and shrubs remarkable for the beauty of their leafage and flowers, and on this occasion, as for some years past, they constituted one of the most attractive and useful of the many good features. Roses continue to be increasingly shown, and both plants and cut blooms were sufficiently numerous to provide abundant entertainment for the rose-lover. Dwarfs and standards were numerically strong and of high quality, but the ramblers in their varied colours, grown in pillar form, probably appealed the most strongly to the general body of visitors. Orchids have throughout the past twenty-one years contributed materially to the success of the shows in the Temple Gardens; but it need hardly be said that there was a considerable difference in the contributions to the section devoted to them this year as compared with the collections contributed to the earlier exhibitions. The increased numbers indicated the higher degree of popularity to which these fascinating plants have attained, and the larger numbers of new forms testified in no uncertain manner to the activity of the ever

MR. CONWAY JONES.

increasing number of hybridists. It was gratifying to have evidence in the exhibition of the continuous increase in the popularity of hardy plants, trees, and shrubs, and orchids; and not less so to find that British ferns are once more being regarded with favour. Of the exhibition as a whole we have nothing but praise, and we heartily congratulate all concerned in bringing it to a successful conclusion on the splendid results of their labours.

Mr. Conway Jones, whose portrait we have much pleasure in giving in this issue, has for many years occupied a prominent position among amateur rosarians, and has throughout been held in the highest estimation by rosarians generally. We are not in a position to say how long Mr. Conway Jones has been engaged in the winning of prizes for roses, or how many awards have been made to roses from his garden, but we know that for a very considerable period he has been a formidable competitor at the exhibitions of the National Rose Society and a few other of the leading societies; and that the prizes he has been successful in winning would make a lengthy list. He has for competitive purposes confined his attention almost exclusively to the cult of the exhibition rose, and year after year we find him staging blooms of the hybrid perpetuals, the hybrid teas, and the teas, remarkable for their splendid development alike in form and colour. Both in culture and staging Mr. Conway Jones has shown so marked an improvement during the past few years that we shall not be surprised to find him carrying off the amateur's challenge trophy at the Metropolitan show at no distant date. There is certainly justification for the anticipation that he will in due course attain to the highest position open to an amateur rosarian, for, in addition to his many other successes, he was awarded the jubilee trophy at the northern exhibition of the National Rose Society in 1906, and last year he obtained second place in the keen competition for the amateur championship at the society's Metropolitan show. Mr. Conway Jones has for some years been a member of the National Rose Society's general committee.

The Rock Garden at Kew contains much of interest at this season of the year, but at present its great attraction lies around the Dripping Well, where white sheets of candytuft drape the surrounding rocks, and where golden calthas are reflected in the little streamlet. But of equal beauty is the large patch of Cardamine latifolia, a very handsome purplish-rose flowered species from the Pyrenees. It is quite at home in its moist surroundings, and is well worthy of noting as a meritorious plant for water margins.

Prospects of the Fruit Crop.—It is now many years since the prospects of an abundant yield of fruit have been so favourable at the end of May as they are this season. When at the end of April the United Kingdom was visited by wintry weather of quite exceptional severity, it was feared by many that an immense amount of damage had been done in orchards and fruit plantations; but happily at that time but few blossoms of orchard fruits had expanded. The plum trees were the most advanced, and where, as in the neighbourhood of London, they were partly in bloom, the flowers on the outside of the trees were destroyed. Those on the inner branches escaped, and fairly good crops will be gathered from trees that were almost in full bloom. The majority of the plum trees were not in flower, and as the fruits have set well, there will, on the whole, be a heavy crop. Cherries promise an abundant yield, and of Morellos there is a prospect of an exceptionally heavy crop. Pears have set their fruits so freely as to justify the anticipation of one of the heaviest crops of recent years. Apples also promise a record crop, for the fruits have set well, and as the trees have not been taxed of late years by excessive fruit bearing the quality should be high. Currants and gooseberries were in bloom at the end of April and suffered considerably from the effects of the severe frost, but the damage is less than was at one time feared would be the case. Some damage was also done to strawberry plants in open fields, but not sufficient to have any material effect upon the crop as a whole. Altogether, the outlook for fruit growers is more satisfactory than for several years past, as all kinds have at the present time the promise of yielding an excellent harvest in due season.

The Gardeners' Company.—A special meeting of the Court of Assistants of this company was held on the 19th inst., at Fishmongers' Hall, to confirm the minutes of a meeting held on March 24 relating to the conferring of the honorary freedom of the company on the Duke of Teck, Lord Meath, Lord Monkswell, Professor W. A. Herdman, and Mr. F. S. W. Cornwallis. The Duke of Teck wrote expressing his regret that his duties prevented him leaving Vienna, and Lord Monkswell was stated to be too indisposed to attend. Lord Meath, Professor Herdman, and Mr. Cornwallis were then admitted to the freedom of the Guild. Following the special meeting was a ladies' dinner at the same hall, and at this, as at the meeting which preceded it, the Master, Sir Thomas Dewar, presided. The toast of "The Gardeners' Company," was proposed by the Lord Mayor, and in reply the Master said the Gardeners' Company was doing its best to raise the prestige of the City Guilds, and they were about to apply to the Court of Aldermen to allow their livery to be enlarged. Their aim was to foster gardening industry and to further the interest of gardeners.

Apple French Crab.—With reference to the correspondence on the question of the identity or otherwise of Northern Greening with the French Crab, Mr. George Bunyard, V.M.H., writes: "Your correspondents are wide of the mark in thinking Northern Greening apple to be the same as French Crab. The former is more egg-shaped and often has an enlarged stalk or knob, and the growth is upright, compact, and full of spurs, while French Crab is of moderate growth, rather open in the head, and generally in old trees umbrella shaped. The fruits are very hard and firm, and often keep two years, and I have seen them hang on the trees till January. Northern Greening, which in Sussex is called Walmer Court, is a smooth green apple, sometimes in sunny years deep red and bronzy on the sunny side, and is sub-acid in flavour, and quite distinct from the dry and harsh flesh of the French Crab. It is unfortunate that Winter Greening is recognised as a synonym of French Crab, and very confusing. The best form of the Northern Greening type is the variety known as Sandringham.

Cyclamen Flowers from York.—From the Deighton Grove Gardens, York, Mr. G. W. Richardson sends us a box of flowers and leaves of the strain of cyclamen which he cultivates so successfully. The strain of giant forms is an exceptionally good one, the flowers large, with broad, stout segments, the whites remarkable for their purity, and the rose, pink, and red shades bright and effective. The butterfly type is not less remarkable in its way, the flowers being large and effective in colour. The flowers have not been sent us for the purpose of obtaining an expression of opinion as to the merits of the strain, but as evidence of the value of cyclamens for decorative purposes, and the supply of cut flowers when well grown. We have, however, thought it desirable to refer to the high quality of the types for the purpose of congratulating Mr. Richardson on the judgment he has shown in devoting his cultural skill, which is evidently of a high order, to subjects worthy of it. Some of the leaves have a diameter of fully five inches, and are beautifully marbled and free from a trace of coarseness.

Rhododendron Exhibition at Regent's Park. — Messrs. John Waterer and Sons' exhibition of rhododendrons in the gardens of the Royal Botanic Society, Regent's Park, will be opened on Wednesday, the 10th inst.

Summer Bedding at Birmingham.—Preparations for the great summer display of flowers in the Birmingham parks are now being pressed forward. The spring display has been good, but very late. Mr. W. H. Morter, the parks superintendent, has a busy time before him during the next fortnight, as a quarter of a million zonal pelargoniums have to be planted, together with tens of thousands of lobelias, pyrethrums, alternantheras, etc., ten thousand fuchsias, two thousand five hundred [illegible]liums, and about a hundred thousand each of stocks, coreopsis, and marigolds, as well as fifty thousand asters. These figures give one some idea of the immense amount of work to be done, and the forethought brought to bear upon the beautification of Birmingham's parks.

Friar Park Gardens.—Sir Frank Crisp, LL.B., has forwarded the sum of £31 6s. 5d. in aid of the funds of the Gardeners' Royal Benevolent Institution, being a proportion of the admission fees paid by visitors to the beautiful gardens of Friar Park, Henley-on-Thames, on the occasions on which he has generously thrown them open to the public.

A Heavy Hailstorm passed over South Lincolnshire a few days since, and, although of short duration, did some damage in fruit plantations. The injury to the tender fruits is, however, much less than was at first supposed to be the case.

Flowers sent to this country from abroad during April were returned as of the value of £42,681, making the total for the first four months of the year £137,5[illegible]. These figures represent a decrease for the month of nearly £8,000, and for the four months an increase of £472.

Tulip Show at Philips Park, Manchester.—One of the largest of Manchester's open spaces is Philips Park, in the Bradford and Clayton district, and here each spring a fine display of bulbous plants is provided, and on Sunday, when these are at their best, if the day be fine, the residents and many folks from the surrounding neighbourhood make a point of visiting the park, and bright dresses vie with bright flowers. "Show Sunday" was on May 17, and the tulips, then in great beauty, attracted many thousands of people.

OUTDOOR TOMATOES.

From the point of view of a gardener who has glass structures to spare for the culture of tomatoes, the outdoor culture of this subject is scarcely worth troubling about, so uncertain is it in our climate. It is quite a different thing, however, in the case of those who lack glass accommodation, for the chance of getting a good return for the pains involved is to them well worth hazarding.

In warm, sunny seasons, under good management, a fair return is almost certain, though, unfortunately, when preparations for a crop have to be made one cannot foresee what kind of season we are entering upon, hence the risk. Some years ago we used to grow a number of plants out of doors, but for the foregoing reasons the practice was discontinued. Chemin Rouge, Vick's Criterion, and Large Red were the varieties we were most successful with.

It is important for outdoor culture that the plants are sufficiently advanced at planting time, early in June, for their earliest clusters of flowers to have set fruit, and even then, in the best of seasons, the weather does not keep warm enough for a sufficient length of time for the latest fruits of a good crop to ripen out of doors. Notwithstanding this, a mistake may be thoughtlessly made by sowing the seeds too early, and thus sometimes the plants are kept long enough in pots to become stunted and weakened ere they can be safely planted out.

The end of March or beginning of April are suitable times, if the plants are given good treatment, for sowing the seeds. The young plants should be potted off in small pots, and subsequently shifted on, until finally planted out from pots of six-inch or seven-inch diameter. While passing through these stages of growth they should be kept near the glass in gentle heat, be carefully watered, and the pit must be well ventilated in accordance with outside conditions. They must, however, be gradually hardened off, and for a week or so fully exposed before being planted out.

The tomato is a sun-loving plant, therefore one of the most necessary points in its cultivation is to plant it upon a warm sunny site, and this is desirable even in the brightest of seasons. If walls or close wooden fences are available they answer admirably for training the plants upon, and, moreover, they assist in forwarding the ripening of the fruit. In any case, in the absence of walls, a sheltered warm border is to be preferred, though in favourable districts splendid crops may be grown in open quarters.

The land should be well manured, and especially is this necessary in hot, dry seasons, when the plants may be relied upon to produce good crops. In wet, dull seasons manure may not be so much wanted, but in whatever way the land is prepared, the crops will be of little value under such conditions of weather. The best outdoor crops that we ever had were grown upon an otherwise disused old vine border, which was heavily dressed with stable manure previous to planting.

Walls with south or nearly west aspects only should be utilised, and against these the plants should be placed, two feet apart, each being kept to a single stem. When planting on borders or in open quarters the rows should be at least two feet apart, and the plants in them the same distance asunder, each plant being provided with a sound stake, to which a single stem should be secured. Stop the plants when they have made three or four clusters of flowers, and rub out all side growths. If the weather proves to be hot and dry mulch with short stable manure, and water as necessary, using weak liquid manure, or give a top-dressing of a suitable quick-acting artificial fertiliser, should the plants show signs of distress.

T. Coomber.

The Hendre Gardens.

THE PERPETUAL CARNATION FOR SUMMER FLOWERING.

Much has been written about the perpetual-flowering carnation from the many aspects in which it appears to the various writers. Yet, regarded as a summer bedding plant, it seems to have a new aspect entirely. The future of this popular plant in this sphere is, I think, assured, as last summer Messrs. Hugh Low and Co., of Bush Hill Park, Enfield, had a collection of all the current varieties flowering out in the open, thus proving their adaptability to this method of cultivation.

Larger flowers on long, stiff stems are procured in greater quantity by this means than would have been obtained had the border varieties been grown. There is also a double advantage in that May or June is quite early enough to plant out the perpetual varieties, whereas the border varieties demand being planted in the autumn or very early spring.

If late-rooted cuttings of the perpetual carnations are grown and wintered in cold frames, they should be fine bushy plants in five-inch pots, with from eight to ten flowering shoots, fit for planting out in May of the following year, while plants which have produced an early winter crop of bloom, will flower profusely if planted out for summer flowering in May; even early rooted cuttings, stopped, and with five or six breaks, flower well out of doors during the summer if planted in May. These latter may be lifted and potted in the autumn to produce a continuation of bloom during the winter. In the trials at Enfield, it was found that the plants allowed to remain out of doors, also some planted out as late as September, withstood the winter perfectly; indeed, quite as well as the border varieties grown as neighbours to them.

TEMPLE SHOW—NEW DWARF POLYANTHA ROSE BABY DOROTHY.
Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

In a cold frame, with simply a covering of frame lights, and in which fifteen degrees of frost were registered, several thousands of plants withstood the winter perfectly, only an occasional plant dying. Surely this points to a bright and happy future for the perpetual-flowering carnation.

Montagu C. Allwood.

Bush Hill Park.

New Botanical Garden for Baltimore.—The new botanical garden of the John Hopkins University, at Homewood, Baltimore, U.S.A., is under the charge of Professor D. S. Johnson. The head gardener is Mr. W. H. Witte, who has had considerable experience of botanical gardens in Germany and Italy.

THE DAHLIA AS A GARDEN ORNAMENT.

The dahlia is a plant that has suffered from its own popularity; instead of being used for actual garden adornment it is too often cultivated in plots, or stiff rows, merely for blossom yielding; sometimes the flowers are designed for the needs of the house vases or to give away, in other cases they are wanted for exhibition, while many an instance could be quoted in which they are for no purpose except to prove how well their owner can grow them. No doubt these are all legitimate objects of cultivation, yet the dahlia is not treated justly unless it is recognised as one of the most beautiful of plants for improving the effect of the garden.

TEMPLE SHOW—A FINE WHITE TREE CARNATION, LADY BOUNTIFUL.
Mr. W. H. Page, Hampton.

Last year I was privileged to see how a large lawn can be studded along the edges with dahlias with truly excellent effect. The plants were set singly in smallest round beds, so that their luxuriant foliage touched and spread over the turf when they had attained full growth, quite hiding any earth. Some groups were made of those beds in threes, fives, and fifteens, the colours having been chosen for giving an exquisitely shaded result; in other places single beds were ranged round the edges, just as we treat standard roses; cactus, decorative, and single dahlias were the kinds employed.

Show dahlias, handsome though they undoubtedly are, scarcely possess sufficient elegance to be selected for such use; they are at their best in shrubbery borders where they will create colour harmonies, enrich spots where spring blooming shrubs are looking dull, and fill up gaps. They are especially useful to add to new shrubberies or hedges of young shrubs in order to gain shelter and a screen during the immediate summer and autumn; the nourishment and water demanded by them will prevent their neighbours from suffering through their gross feeding propensities, for superfluous food and drink will actually benefit the permanent subjects, and the interlopers will be removed just as the trees and shrubs are storing up strength for the winter and the following spring's bud and leaf production.

Many a plain laurel hedge or shrubbery could be made beautiful each year by the cultivation of show dahlias in a border bed of rich soil made in front; scarlet, gold, crimson of the brown type, cream, lemon, and white varieties might well be mingled. There are a few admirable effects to be gained by massing dahlias of any class against certain trees and shrubs. Copper beeches, for example, prove a glorious ruddy background for salmon dahlias, so also, of course, would any other subject possessed of bronzy-crimson foliage. The peach-mauve of some dahlias may well be arranged against golden elders and other foliage in which yellow shows, while cream or white dahlias would be equally beautiful if less uncommon in effect.

Wherever there is woodland adjoining a garden, any sort of park land in fact in which bracken fern appears in quantity, the practice should be adopted of planting a few groups of different coloured dahlias, in self masses, at various points, because the autumn hues that the bracken assumes is one of the natural beauties that should be pressed into the service of the landscape-gardener. It is customary to add rhododendron bushes to cultivated woodland openings, but the dahlia should also be recognised as a fit robust plant to introduce annually.

Silver, and white and green variegated trees and shrubs, of which Acer negundo may be taken as an example, make the best backgrounds possible for either rose and carmine, or cerise and scarlet dahlias. In many shrubberies there is not space for any quantity of show, cactus, or single dahlias, yet foreground sites could even then be found for pompons and Tom Thumb dahlias.

The value of the dahlia for bank adornment does not seem to be sufficiently realised; certainly there are bleak places where the gales that sweep across the land would wreak havoc upon plants raised higher than the level, yet this remark applies with extra force to many of the shrubs, etc., usually chosen, and the dahlia when thoroughly staked and tied can weather many a storm. It is essential to give a support to each shoot; this means that stakes painted a dull green must be used, or else the artificial aid will have an unpleasing appearance. Pompon dahlias are especially suitable for this method. A hedging row of young arbor vitæs upon a bank that surrounds the lawn of a newly-built residence I know has a fine show of alternate cactus dahlias, and a row back and front of pompons, the whole forming a close screen of foliage and blossom.

For terrace ornaments dahlias grown singly in square green-painted deep boxes can be highly recommended, not only will their stately height be of value until there is danger of frosts at night, but if the boxes are removed to sheltered south verandahs, balconies, or porches, the flower-yield will be continued much longer, while should there be a conservatory, or any glass-house large enough to accommodate them, the chances are that perfect dahlia blossoms will be produced in November and December.

Lastly, the kitchen garden borders may be made lovely by the planting of a single row of dahlias, the various types of the flower being skilfully grouped and alternated so as to prevent any stiff monotony.

M. H.

Primroses and Polyanthuses, wallflowers, campanulas, and other biennial seeds should now be sown to insure good strong plants for another season. Sow on a warm open piece of ground, well pulverised, but with no fresh manure added. Draw shallow drills about six inches apart, and should the ground be very dry give a good watering a few hours before sowing. Do not sow seed too thickly in the drills.—E. F. H.

Spring Bedding.—Continue to clear away spring bedding plants as they pass out of bloom. With myosotis that have any seed on them, a plan I have sometimes followed has been to scatter them about in parts of the wild garden or woods, where a number of the seeds are sure to germinate, and the following season produce a nice effect, though I find the plan does not answer as well here as in the south. All other plants required for future use must be planted in the reserve garden, propagating and dividing them according to requirements. Aubrietias may be either divided into small tufts or have cuttings inserted singly in a close cool frame, where they will soon root and make nice material for autumn planting; pink cuttings may be inserted in a similar way.—E. F. H.

INFLUENCE OF UNFAVOURABLE SEASONS.

[illegible] aftermath of a cold, sunless summer [illegible] 1907 is sure to be well marked [illegible] ways the following season. On [illegible] ing in a daily newspaper of the suicide [illegible] fraternity at Halifax, and that [illegible] was the unsatisfactory promise for [illegible] of the peaches and vines and [illegible] conservatory plants, it occurred to [illegible] a few remarks on the subject may [illegible] interesting. I know from personal contact with many gardeners that no class of [illegible] are more anxious to please their employers, and we are equally certain that no class of men are as much subject to the vagaries of the different kinds of seasons than are gardeners.

Speaking generally, 1907 was not a good [illegible] for the wood of peach trees to be well [illegible], a condition so essential to success. [illegible], in many places, the crop will this [illegible] as good as usual, and in others of [illegible] different character. We find this year [illegible] some sorts have not set well, notably [illegible] Silver. Such free setters as Dr. Hogg are as good as usual. Hale's Early never fails, but Alexander is not as good as usual. Violette Hâtive, Royal George, and Sea [illegible] are very good. Princess of Wales has [illegible], likewise Exquisite. Dagmar never [illegible]. This year Noblesse is not good, [illegible] very full of flowers. Of nectarines [illegible] Rivers set well, Pineapple and Pitmaston Orange are promising a good crop, Victoria and Prince of Wales are not as good as usual. Of the Salway we have a tree, planted in 1865, and this has set a good crop.

During my thirty years' charge this is the only old peach tree left. I have replaced all the others at different times. We have twenty-five trees, and these are all inside, as outside culture is unsuccessful in our district. We invariably have good crops, though some seasons better than others, and in cold summers it is better to give the trees more fire heat, and not throw the houses open too soon after the fruit is gathered. This, in an artificial way, materially assists in ripening the wood for the following season. I have omitted to say Downton and Lord Napier nectarines have not set so well as usual. From practical observations of the varieties of peaches and nectarines, if I was limited to one variety of each I should select Royal George peach and Elruge nectarine, for those varieties are of the highest order of merit as regards flavour, and withal sure bearers.

With regard to vines, the same treatment applies. A very great deal more fire heat than usual was necessary last year to ripen the crops, and also to mature the wood for this season. The promise this year is good, with the exception of the capricious variety, Cannon Hall Muscat, which has several blind spurs, and shows most fruitfulness on long shoots laid in, and not spurred in very close, indeed the restrictive system does not suit this variety.

With regard to conservatory plants, camellias are not so free-blooming as usual, for in many cases they made a second growth last year owing to lack of sunshine and to the excess of humidity. Azaleas of the Indian type made fewer flower buds. Callas were too exuberant in growth, and consequently fewer flowers. The tea roses in pots [illegible] rather starved outside, and consequently are not as good as usual. The wet [illegible] just suited genistas and coronillas, [illegible] have been better than usual. Agapanthus have fewer flowers than the average. [illegible] plants, such as habrothamnus, [illegible], cantuas, brugmansias, wistarias, and kindred subjects are about as usual, or [illegible] to be. Cyclamen, cinerarias, primulas, calceolarias, pelargoniums, etc., are not [illegible] affected by the weather. No doubt the [illegible] wet weather had a prejudicial effect on the Continental bulbs, which were not quite [illegible] the average, and the clumps of lily of the valley have been somewhat inferior.

[illegible]

W. M.

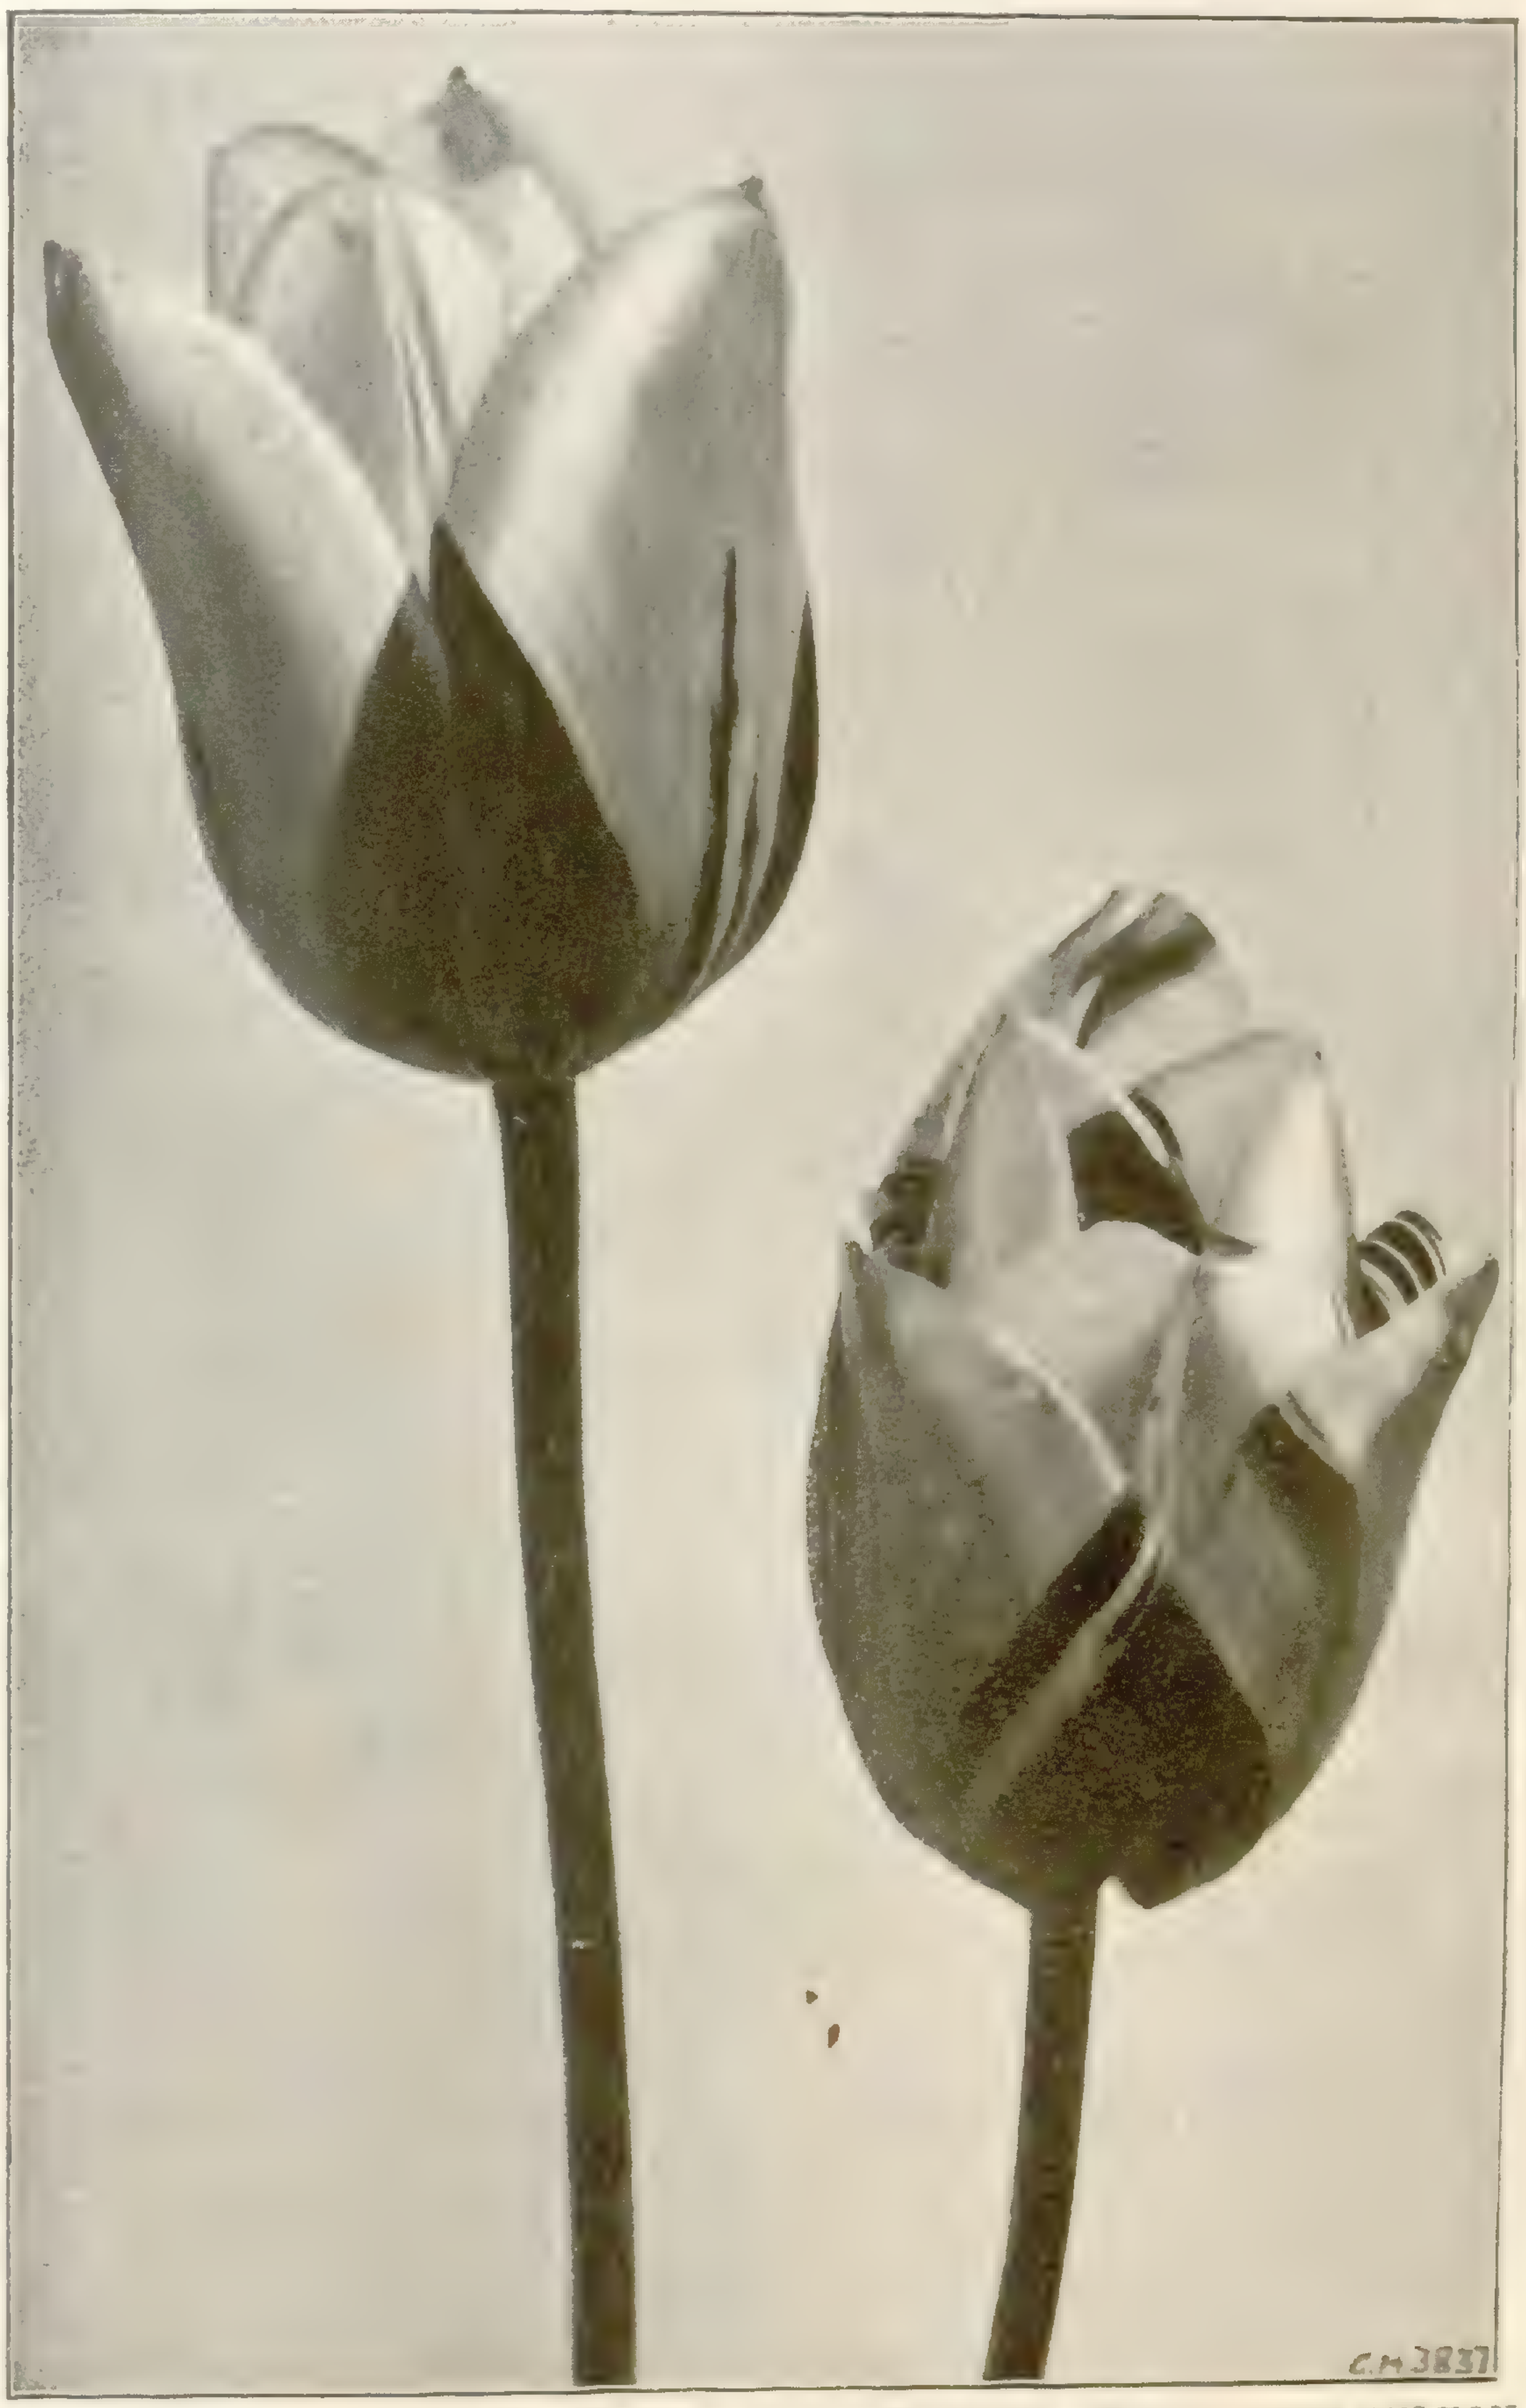
ONOSMA ECHIOIDES.

The Golden Drop finds a host of admirers everywhere, and, although it is quite an old plant, and has been widely recommended, it is still far from common in gardens, and well-flowered specimens are not often displayed at shows. It forms a low mound of narrow hairy leaves in close rosettes, and produces from May onwards a series of trailing two-cleft spikes of tubular golden yellow flowers that are sweetly scented, and very attractive when in full display. It grows just as well in the border as in its home—the rock garden, but in every instance needs the support of a few half-buried stones to raise the spikes from the soil and to keep the growths free from stagnant moisture—the greatest difficulty the plants experience under cultivation.

I have seen it thriving in "torrent" form, amid boulders on the rock garden; I have seen it draping a large boulder in its own inimitable way; as a border plant, and growing also in an old retaining wall where a brick or two was missing, so that its roots had access to the bank of soil beyond. In all these positions there was a plentiful display of the curious snaky growths and flower stems.

It will need a year in which to establish itself, and will thrive indefinitely afterwards, but removal of an established plant is practically a certain way of killing it. Propagation is readily effected by layering the growths, carnation fashion, at midsummer; if the plant's position does not admit of this being done, tiny pipings which spring from the root-stock can be removed intact in August, and rooted under a bell-glass in shade, without the aid of heat. The largest leaf rosettes will not root if severed from the plant entirely. Plant in full sunshine and in spring always.

G. B. MALLETT.



TEMPLE SHOW—A BEAUTIFUL MAY-FLOWERING TULIP, CHAMELEON.
Messrs. Hogg and Robertson, Dublin.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

AMONG THE ALPINE FLOWERS.

"Hail! bounteous May, that dost inspire
Mirth and youth and warm desire;
Woods and groves are of thy dressing;
Hill and dale doth boast thy blessing."

As these notes are written the "merry month" is closing, but, after a late season, we seem as yet just entering upon the realisation of the beauties of the time. The garden is winsome indeed, and, although there are evidences to those who know it best of the stress and strain through which the plants have passed in the hard weather of last month, to the unknowing these are invisible, and the flowers seem as brilliant as ever before. There are many calling for notice now, and only a few can be chosen for it in this time of true rejoicing for the cultivator of the alpines flower in the garden.

Saxifraga Wallacei

One of my favourite saxifrages of the mossy section, albeit the foliage is a little too large to come satisfactorily under the ægis of that class, is the charming S. Wallacei, probably a hybrid form, which was raised by the late Mr. Wallace, of Dean Cemetery, Edinburgh, and which worthily bears his name. It is by no means uncommon, but it is such an excellent flower of its kind that there are many more who might cultivate it to advantage. It seems to have a preference for a northern exposure, and a good plant trailing over a large stone and draping it with its pretty light green leaves, liberally spangled with the comparatively large, shining white flowers is attractive in the extreme. It was raised originally from seed of S. Maweana or S. corsicana, and is probably a hybrid, as it always appears to produce infertile seeds. Its whole height is about six inches, but it will hang over a stone of some dimensions if left alone for some years, and can be satisfactorily cultivated in a gritty soil which is not too rich.

Lithospermum canescens.

Although apparently plentiful in its own land, the Hoary Puccon, as Lithospermum or Batschia canescens is called in the United States, is far from common in collections of alpine flowers in this country, and I am glad to find that it has now become established in this garden, where it is doing better than in my former one, although it grew fairly well there. It seems to have an inherent dislike to the wet which is the bane of so many alpine flowers in many parts of these islands, and, as it naturally affects a dry soil, this must be specially studied here. It is growing with me on a dry and sunny ledge a couple of feet or so above the ground level, but partly shielded from the west rains by a hedge, and is otherwise exposed to full sun. It is a true herbaceous plant, and those who may secure it for the first time are not to suppose that it is lost because it is long of making growth in spring, seeing that it is late in appearing above the ground in all seasons. In height Lithospermum canescens is variable, growing at home from six to eighteen inches high. The form here is about six inches high, and it constitutes a rather distinct-looking subject with its narrow leaves, and its clustered flowers of a deep orange-yellow. It opened here this year about May 20, and will remain in bloom for a considerable time. The name of canescens is given because of the rather hoary foliage. As already indicated, it ought to have a dry soil, as it grows in such in its native habitats—from Ontario to Western New Jersey and Alabama, west to the North-west teritory, Kansas, and Arizona.

TEMPLE SHOW—A HANDSOME STOVE FOLIAGE PLANT, HELICONIA ILLUSTRIS.
Messrs. W. Bull and Sons, Chelsea.

Corydalis nobilis.

The noble fumitory is one of the best of the rock plants which can be cultivated in the ordinary border, but it always looks much more ornamental when on rockwork than on the level, and I well remember the effect of a specially well-grown plant which I once saw in a splendid collection of alpines on a rockery bank, and about two feet above the level of the eye. This plant considerably exceeded the normal height of nine to twelve inches. It flowered extremely well, and a most pleasing appearance it had with its finely-cut, ornamental foliage, and its pretty flowers of a pale yellow, tipped with chocolate and green in clusters. Corydalis nobilis is not difficult to cultivate in ordinary soil, and as it is a reliable May-blooming plant, and a long liver save in most unfavourable positions, it might be again more sought after, as it does not seem to be so much in favour as at one time, when good hardy flowers were less plentiful. It likes a light and deep rather rich soil, and can do with some shade, although thriving well in the sun. It comes from Siberia, and is perfectly hardy with us.

Saxifraga cotyledon icelandica.

I have here just beginning to bloom the fine silvery saxifrage, about whose true name some mystery exists (as, alas, exists about the names of too many saxifrages), and which is known as S. cotyledon icelandica. I have had it thriving here for some three years or so, and it is only lately that I have learned from Mr. Reginald Farrer's "My Rock Garden," whence it came, and all that is known about it. It came to me from a friend, who only knew its name as S. icelandica, and I have been so much impressed by it that it was with more than ordinary pleasure that I found it referred to by Mr. Farrer in the following words in speaking of the forms of S. cotyledon: "The finest of all dislikes me, unfortunately, and, I fancy, craves a soil devoid of lime. (They have, I hear, the same ill-success with it at Kew.) I call the thing Cotyledon icelandica because at St. John's, Oxford, whence I had it, it had been originally collected, I believe, in Iceland. It is a most gorgeous plant, as they grow it there—forming enormous, impressive flat rosettes of unusually bronzed, feathery, strap-shaped leaves, with great four-foot plumes of blossom almost incredibly splendid. Here, however, it only exists, and displays no such generosity."

I have ventured to quote Mr. Farrer at some length because he gives what is a fairly well-balanced account of this saxifrage, which is, without doubt, the most handsome of all the forms of the fine pyramidal saxifrages. Here it is doing more than merely existing, as it is flourishing well up in the rock garden, and is a truly fine thing either in or out of bloom. There is no lime in the soil of this part of the rock garden, and this perhaps accounts for its thriving state here, but there are few of the silvery saxifrages which dislike calcareous matter. My plant must, however, have more space, as a Spanish geranium next it threatens to carry out a process of expulsion, which must not be allowed, and it must itself find a happy corner elsewhere. The keeping of strong-growing kinds well within bounds is at all times essential.

S. ARNOTT.

THE PROFESSION OF LANDSCAPE GARDENING.

(Continued from page 404.)

There are a few centres of enlightenment devoted to horticulture in which the subject is treated, I believe, as an important branch of gardening, but I have been unable to discover any educational institution which adequately recognises it as affording professional possibilities distinct from horticulture, and it is certain that many earnest young men who desire to adopt the career are at a complete loss as to the best means of doing so. Some of them have been blindly through a long course of horticultural study, and at the end have found themselves short of many essential qualifications.

There are, of course, considerable difficulties in the way of providing education on an adequate scale, but if the gardening world were unanimous in demanding it, an important step would be taken towards their removal. It is an obvious criticism that with so much difference of opinion among garden designers as to what constitutes beauty in a garden, it might be difficult to hit on a form of teaching which would meet with enough general approval to warrant the experiment. After a century or so of controversy, however, the matter seems to be simmering down sufficiently to render practicable a sort of "Cowper Temple" settlement.

A good deal of hard language has been uttered against both formal and informal gardens by men whose prejudices incline them towards one or the other, but each form of art seems to have thrived on abuse, and seems unshakeably established.

Thinking it would be interesting to know something of what was being done in other countries in the matter of education in landscape gardening, I have bothered some eminent gentlemen for information, which they have given me with the utmost kindness and readiness. In Germany the subject of landscape gardening is not included in the curriculum of any University. Instruction in the art is given, however, in all public and private horticultural schools. The chief school (formerly at Potsdam) is now at Dahlem, near Berlin, where great attention is given to the question. At Laubegast, near Dresden, a great speciality is made of it in the Gartenbauschule. There are also important schools at Weihen Stephan, in Bavaria, at Reutlingen in Würtemberg, and a private school in the principality of Reuss.

There are now two National Societies of Landscape Gardeners in Germany. It is interesting to know that there is some difference of opinion as to whether garden construction is a perquisite of the architect, or should be the privilege of the landscape gardener. We seem to have heard the echo of a debate over here. One hears incidentally that the designing of race-courses occupies a considerable share of the time of many of the best landscape gardeners in Germany. But it can scarcely be suggested that this diversion offers an extended field for practice in England.

In France landscape gardening is taught in no University or public schools, although it is exhaustively treated at the Ecole Nationale d'Horticulture in Versailles, which is considered the University of Horticulture. It is also made a special subject for study at the Ecole d'Horticulture de la Ville de Paris. There is no society of landscape gardeners in France beyond that formed by a special section of the National Horticultural Society. Landscape gardening is taught in Austria in all horticultural training schools, particularly in the agricultural schools in Eisgrub, near Lindenburg, Lower Austria. There is no society or special department for landscape gardening in Austria.

It is in the United States, however, that one finds a model precedent which may be of great assistance, and it will surprise many to find how seriously the question of education in the art of landscape gardening is considered in that go-ahead country. It is, in many respects, an ideal land for the development of gardening of all kinds, owing to the individual wealth and public spirit of the inhabitants—to competition in luxury—to the sylvan resources of the country, and to the new and vast spaces available for treatment.

The capacity of Americans to concentrate and specialise makes them rivals always to be respected, and there is little fear that impracticable schemes of education will be found at their best Universities. Americans use the phrase "landscape architect" in place of our term "landscape gardener," but in the references which follow the English expression is substituted.

Definite instruction in landscape gardening is given at Cornell University, Ithaca, N.Y.; at the University of Illinois, Urbana; at Columbia University, New York City; at Massachusetts Institute of Technology, Boston; and at Harvard University, Cambridge, Mass. Some tuition in landscape gardening is offered by many of the horticultural and agricultural schools and colleges, but I do not know what weight is to be attached to it. A typical example of this group is to be found in the Massachusetts State Agricultural College at Amherst. The course offered at the famous University of Harvard is decidedly the most complete and important obtainable in America. The official register of the University deals with, and illustrates, the importance attached to the question so fully that I shall venture to quote verbatim, and piece together a good many points of information and advice contained in it.

A pamphlet issued in 1907 states that "the object of the courses of education outlined, is to provide instruction in the elements of technical knowledge, and training in the application of principles of design, which together form the proper basis for the professional practice of landscape gardening." A student may obtain professional training in landscape gardening in Harvard University, including both elementary and advanced work, or having had the necessary preparation in another college or scientific school, may proceed at once to the graduate courses. By registering in Harvard College a student may elect courses which will be counted for the A.B. or S.B. degree, and prepare him for the concentrated professional study in the Graduate School of Applied Science.

(To be continued.)

TEMPLE SHOW—NEW RAMBLING ROSE TAUSENDSCHON.
Messrs. Wm. Paul and Son, Waltham Cross. (Award of Merit.)

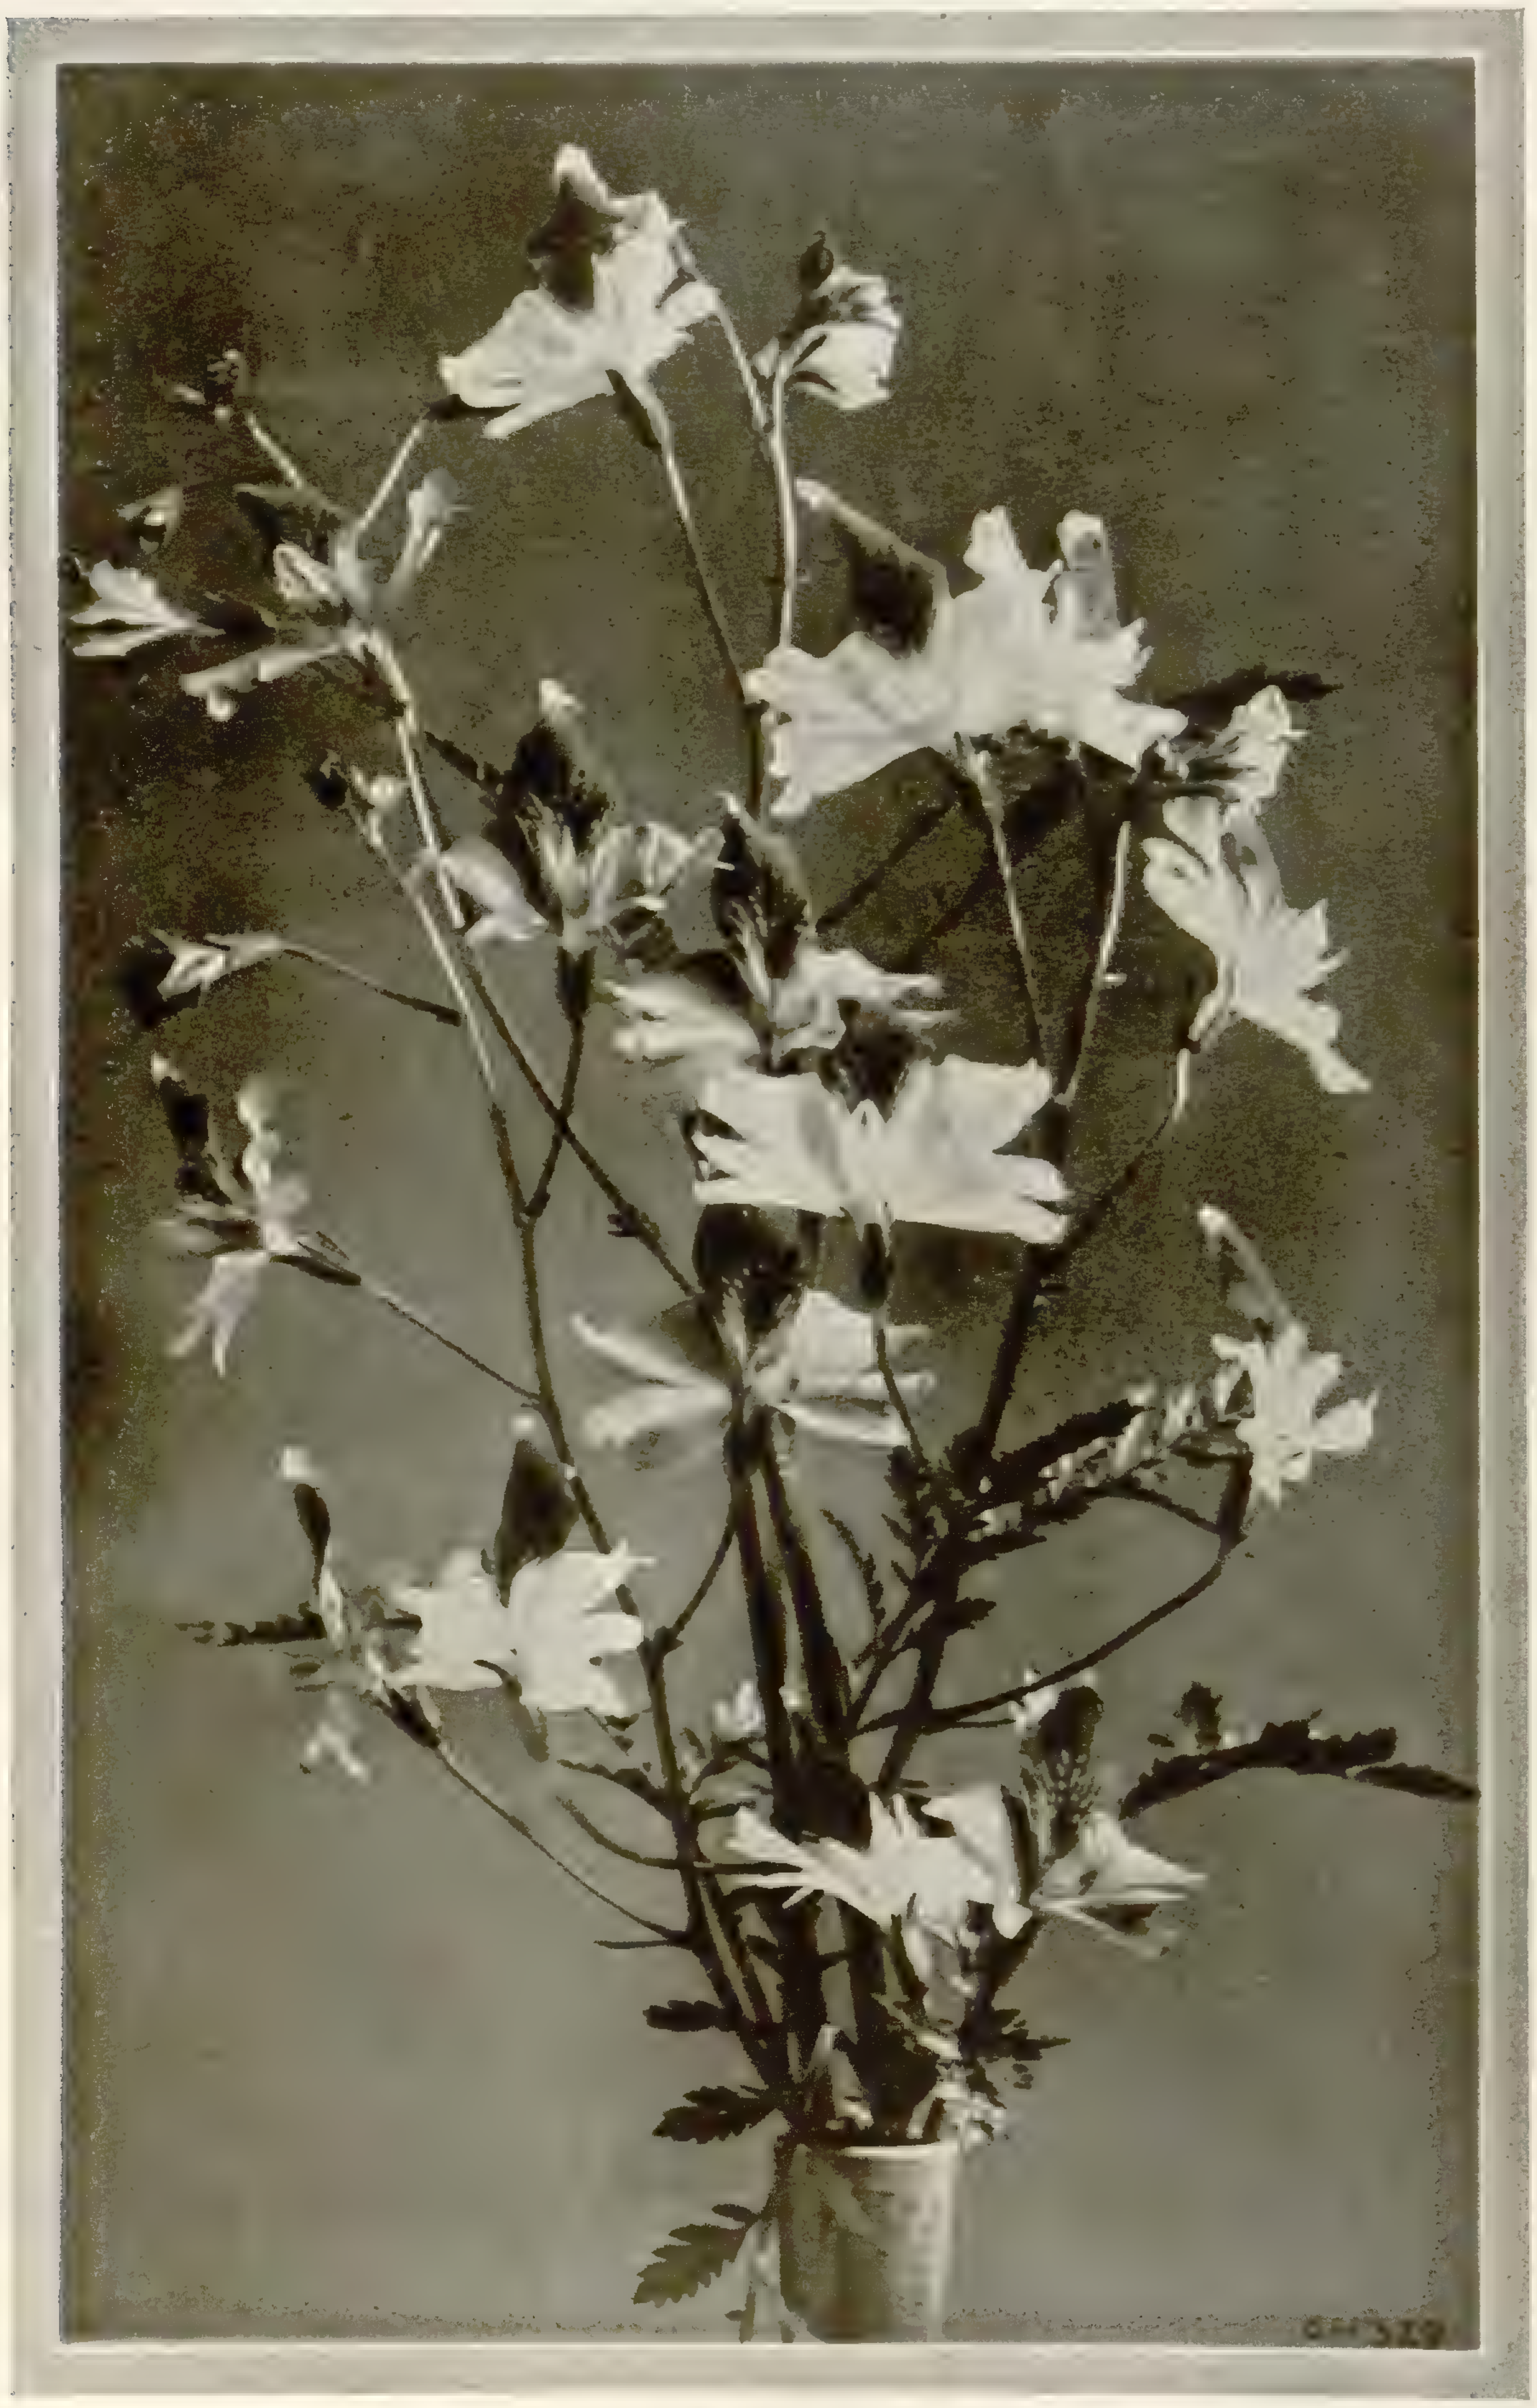
Roses may be grown to perfection by following the instructions given in ROSES AND THEIR CULTIVATION, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HARD-WOODED PLANTS.

There can be no question that plant growing, as carried out one or two generations ago, needed far closer application than is usually bestowed upon it at the present time. Not only were the glass structures and their heating in a less advanced state than nowadays, but the different hard-wooded plants which were at that time so popular required incessant attention in order to build up the huge specimens which formed the main attraction of the flower shows as held in my younger days.

Many of the plants then shown have almost, if not quite, dropped out of cultivation, and it is well nigh, if not quite, impossible to obtain any of the leschenaultias, for even the blue-flowered Leschenaultia biloba major, which the Messrs. Balchin used to do so well, seems to have been discarded since they gave up their nursery at Hassocks. Chorizema Henchmanni, too, with little linear leaves, which render it quite distinct from all the other members of the genus, I have not met with for years, and a specimen of Hovea Celsi, once a fairly common object, though it was always considered to be a good test of the cultivator's skill, is now practically unknown.

The different forms of aphelexis now merged into the genus Helichrysum, were at one time plentiful enough, though they always needed very careful handling, and much the same might be said of the South African Phœnocoma prolifera, whose brightly-coloured flowers always gained them plenty of admirers. Other specimen plants that used to figure largely in the flower shows of byegone days were Aotus gracillima, Bossiæa linophylla, diosmas, Dracophyllum gracile, genetyllis, pimelias, and pultenæas.



TEMPLE SHOW—FINE NEW STRAIN OF SCHIZANTHUS RETUSUS.
Messrs. Sutton and Sons, Reading.

The hard-wooded heaths, too, were represented by numerous species, the large specimens of which were many years old. Now they are nearly gone, for most of the heaths which are grown in quantity by a few of the cultivators for Covent Garden Market belong to what is called the soft-wooded section, under which head are included Erica gracilis, E. hyemalis, E. propendens, E. persoluta, E. Wilmoreana, E. Spenceriana, and a few others. While perfect little plants of these are turned out by the market growers, the plants, as a rule, are grown only in the 48-sized pots, that is to say, those with a diameter of five inches. Two of the hard-wooded section are treated in the same way, viz., E. Cavendishi and E. ventricosa, indeed, delightful little specimens of both of these may be met with at the present time.

The boronias are perhaps the most generally cultivated of all the other hard-wooded plants, for the azaleas, forming, as they do, quite a class by themselves, scarcely come under the above heading. One subject which is still grown in the shape of large specimens is the Scarlet Bottle Brush (Callistemon speciosus), which in nurseries and gardens is more generally known as Metrosideros floribunda. Of this a showy group was noted at the meeting of the Royal Horticultural Society on April 28. W. T.

CLEMATIS MONTANA VAR. RUBENS.

The well-known and justly popular Clematis montana is one of the most lovely climbing shrubs we possess, and numerous instances can be recalled of it growing luxuriantly over wall or verandah, on a fence, or over an old tree or bush, every branch during May bearing a profusion of glistening white, star-shaped flowers. The variety under notice forms a worthy companion to the type, for it is a replica of that plant, with the exception that stems, leaves, and flowers are all deeply tinged with a reddish hue. C. montana is a Himalayan shrub, whilst the variety rubens hails from China. Although the type has been in cultivation for very many years it is only recently that the variety has been included amongst the occupants of our gardens.

Messrs. J. Veitch and Sons received seeds of this variety a few years ago from their collector, Mr. Wilson, and the plants from these were distributed about three years ago. Like C. montana the variety has an excellent habit, and is a free grower, arriving at its best condition in good loamy soil. Cuttings of young wood root readily about the end of July, and it is possible to get really good strong plants in twelve months from the time the cuttings are inserted. Grown in pots and placed in the greenhouse it may be brought into flower in March, but the blossoms are then deficient in colour.

W. Dallimore.

Fragrant Plants.—In gardens which are sufficiently extensive beds or groups of sweet smelling plants can often be arranged, these are not as showy as some others, consequently suitable positions should be selected for them where their fragrance will be appreciated, and their lack of colour not be noticed. Some are quite bright in colour, and a few suitable ones are roses, carnations, stocks, tobaccos, heliotropes, liliums, mignonette, tuberoses, daturas, lavender, scented-leaved pelargoniums, Aloysia citriodora (demon plant), alyssums, and others. Nicotiana affinis has the defect of having a withered appearance in bright light or sunshine, but its fragrance in the evening when it quite revives, more than counterbalances this defect.—E. F. Hazelton.

MUSHROOMS.

The mushroom is at all times much sought after for various culinary purposes. For its cultivation during the winter months, especially in private gardens, heated houses are provided, which are very convenient and useful during the bad weather, not only for mushroom culture, but for the forcing of rhubarb, seakale, and salads.

These houses, although useful, are not absolutely necessary, as far as mushroom growing is concerned, for with carefully prepared horse manure and due attention to the making up of the beds outside during the autumn, and to spawning and covering abundant crops may be secured throughout the winter. In most cases the produce from these beds is to be preferred, being thicker and firmer in texture, and often of better flavour. At any rate, mushrooms from houses during the summer are invariably unsatisfactory, being especially liable to maggots and quick decomposition. For this part of the year I wish to offer a few suggestions as to how useful dishes can be produced with comparative ease.

I am aware that in some parts of the country mushrooms are plentiful in the meadows during the summer and autumn months, and this does away with the necessity of artificial cultivation during this portion of the year. But where they do not so exist crops may be produced by making up small beds at the foot of a north wall. Simply dig out a trench about twelve inches deep and two feet wide, to provide a receptacle for the compost, which should consist of carefully prepared horse droppings and chopped turf, mixed together. Strong heat is not required, but just sufficient to make the spawn run strongly, and from 70 to 75 degrees will do this.

The trench serves the twofold purpose of prolonging the heat and economising the amount of material necessary to form the bed, which should, as the work proceeds, be made moderately firm by constant treading. When finished it should slope slightly from the wall, so that much rain may not settle upon it to saturate it unduly. There will not, with this amount of material, be any danger of the bed rising to a high temperature, but it will, if the usual course of fermenting takes place, be ready for spawning in a few days after making up. As spawn is so cheap and reliable, when procured from specialists, one cannot do better than purchase from them for the best results. Place lumps of the size of a hen's egg about six inches apart and about two inches deep in the beds, and afterwards cover them over with two inches of rather adhesive loam in a moist condition, patted down with the spade to a smooth surface.

The mushroom appears to revel naturally in the fields in a cool, moisture-laden atmosphere, its growth being principally made during the night, especially so after rain, or very heavy dews. Possibly we cannot do better than copy nature as nearly as we can. The position under the wall, as recommended, is cool, and a corresponding moisture can be easily conserved in the beds by giving a dressing of a few inches of grass from lawn mowings, which may be damped over periodically as the weather demands. This simple form of culture does not trespass upon time very heavily, and, as a rule, gives a generous return for the attention and trouble in carrying it out. In many cases such beds go on bearing for three months.

Referring to spawn again, one of the most productive beds that has come under my notice was made up of some fermented horse droppings, loam, and part of an old mushroom bed that contained some strong mycelium: these were merely mixed together, and formed into a bed without further attention as to spawning. The result was highly satisfactory in this case. Yet, unless in practised hands, it is not advisable to accept this method for general use, as there is some uncertainty about the mycelium, and disappointment might follow. Hence my reason for recommending the use of spawn made by specialists.

THE SUPPOSED DEGENERACY OF THE POTATO.

Sir W. T. Thiselton-Dyer, K.C.M.G., F.R.S., contributes the following interesting notes on the supposed degeneration of the potato to the current issue of the "Journal of the Board of Agriculture":—

The undoubted difficulties which now occur in the cultivation of at any rate some kinds of potatoes present a problem which is obviously of great practical importance as well as of scientific interest. It is not, however, satisfactorily disposed of when attributed to degeneracy. The potato plant has not been run out, but too much has been demanded of it, and it has broken down in the attempt to respond. I think a little further light may be thrown on the subject by examining rather more closely what happens in a potato under natural and healthy conditions.

TEMPLE SHOW—NEW FANCY TREE CARNATION, PERDITA.
Messrs. R. H. Bath, Lim., Wisbech.

A potato tuber is an underground branch which, towards the end of the growing season, becomes swollen out laterally and filled with accumulated nutriment for the purpose of giving its buds a vigorous start in the following year. This nutriment is stored up for the most part in the form of starch. Now this is insoluble, and is not available to support growth till it has been converted into something—a sugar—which is soluble. This conversion is effected by a ferment or enzyme called diastase. It can be extracted from the potato tuber and it will do its work quite as effectively outside as inside; it has been found, however, that if an extract be made from an ordinary healthy potato it has, at first, no action on starch; but, after standing for a few days, attacks it energetically.—(Vines, Physiology of Plants, p. 192.)

The explanation is that diastase is not present as such in a potato tuber, but is the result of the decomposition of another substance called a zymogen, a word which merely means "ferment producer." Before the starch in a potato tuber can be made available to support growth two things have to take place: (1) Decomposition of the zymogen to produce diastase; (2) conversion of the starch into sugar by its action. Until they do take place there will be no growth from the tuber.

When, therefore, a tuber fails to grow it is not a sufficient explanation of the failure to say that the plant is degenerate, or that diastase is wanting. Both explanations are conclusively disproved by the interesting experiment of the Curator of Kew in exposing the sluggish tubers to a higher temperature. They then sprouted vigorously, and, after planting, produced a normal crop. It is clear that what was really amiss was that the diastase remained locked up in the zymogen and was not available to do its work. It is known that the production of diastase requires the access of oxygen from the air: it also needs some amount of warmth, and
probably stimulated by light.

When a sluggish tuber is planted, it eith
remains completely dormant or sends
feeble growth which utilises little
accumulated starch. On the other hand
shoot manufactures more, and this is
ferred to the tuber, which actually in

THE GREAT TEMPLE FLOWER SHOW.

It is difficult to believe that twenty-one years ago the Temple Show was being held for the first time. This is a coming-of-age show, and, although we cannot say that the present show is far and away better than its more recent predecessors, we can say that the exhibition is in every way a splendid one. It would be interesting to learn how many firms or individuals exhibiting now were exhibitors at the first Temple Show. That the shows have altered in character will be obvious to all who have had cognizance of these displays during the whole of the series.

In extent this twenty-first show differs little from the twentieth. The extra length of the big tent is as last year, but by a little rearrangement of tabling in other tents it has been possible to add a few feet to the exhibitor's area. Outdoor exhibits are numerous, and of an unusually high character. The orchids are magnificent, and the big tent contains a marvellous picture of graceful beauty and exquisite and gorgeous colouring: the value of the orchids must be immense. Roses, too, are a great feature, and they show in a marked degree the trend of popular taste. Formerly, whereas big specimen H.P. roses were a feature, now the display is chiefly of rambling roses in great variety and beauty. Stove plants, though well shown, are not the feature they formerly were. Hardy flowers are prominent, from alpines and herbaceous plants up to choice flowering and foliage trees and shrubs, and in these respects the present show differs widely from the first.

One distinct feature of the exhibition is the prominence given to annual and biennial greenhouse plants; all these have been developed wonderfully during recent years. Schizanthuses, calceolarias, cinerarias, nemesias, etc., provide a wealth of colouring, and show the care the seedsmen have taken to improve them. Fruit and vegetables, owing chiefly to the backward season, are almost conspicuous by their absence.

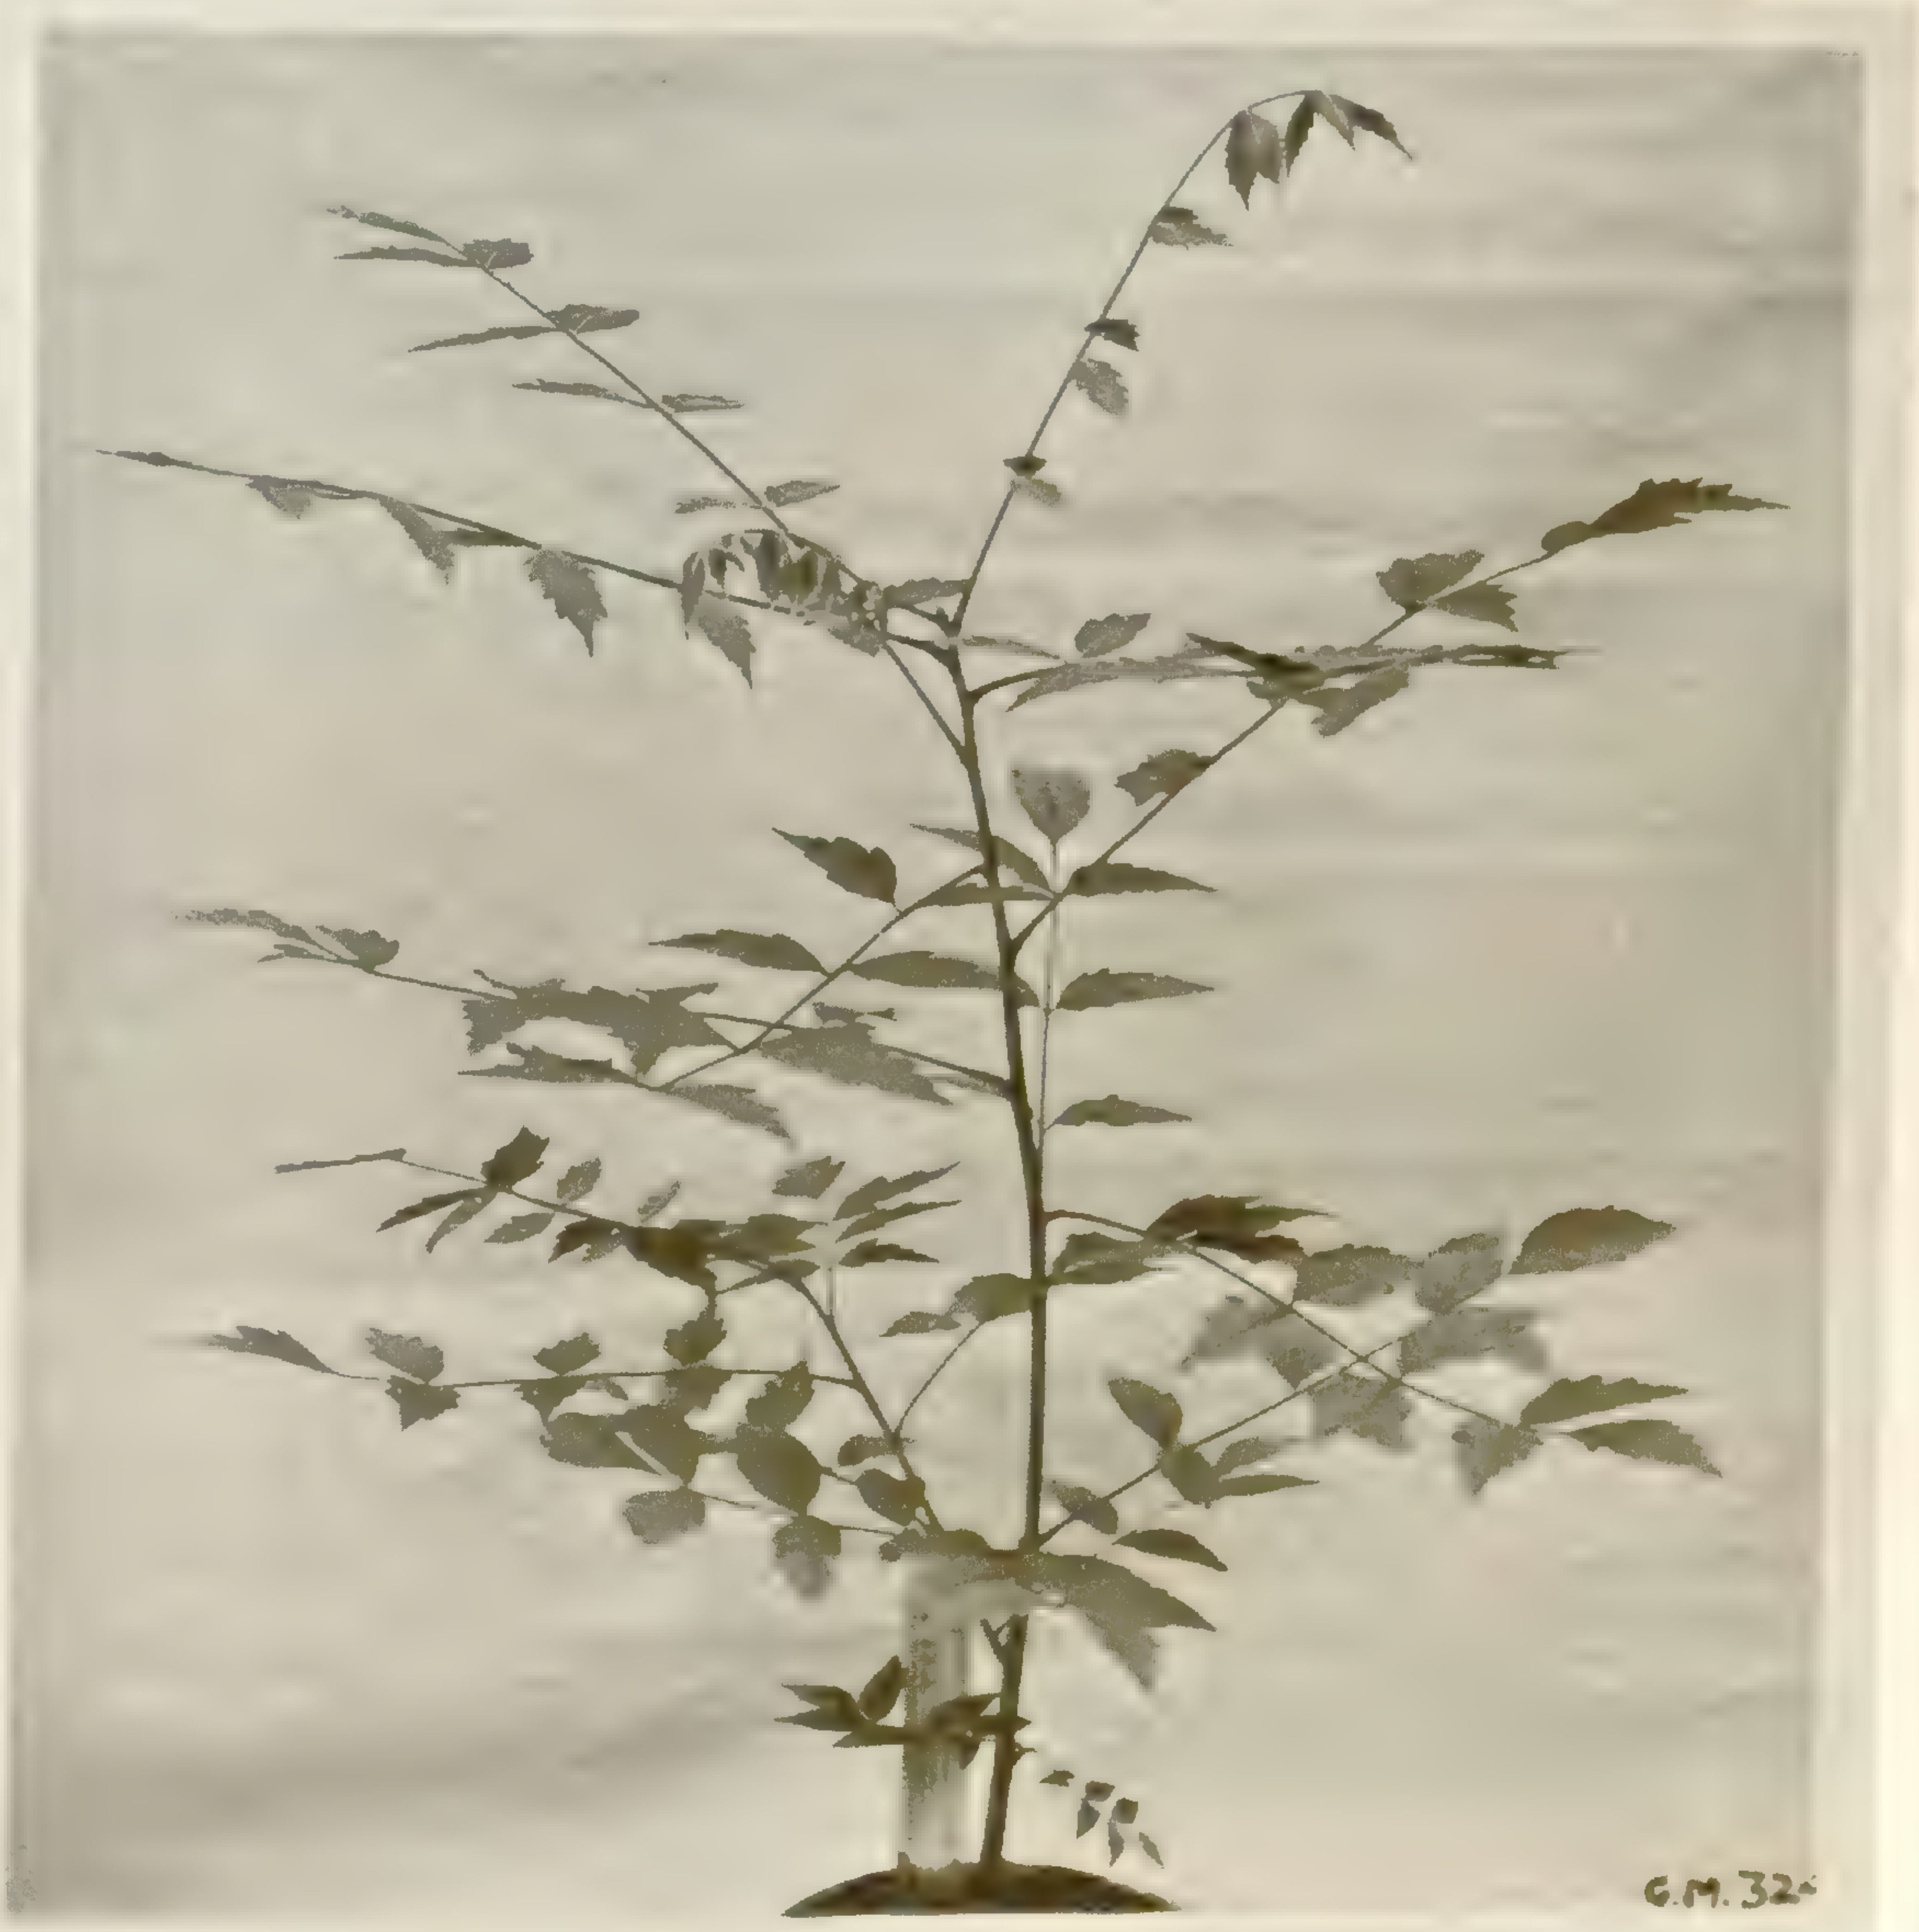
To judge this display there were about forty judges, divided into about a dozen groups. Altogether there are about a hundred and thirty exhibitors. To every visitor was given a catalogue containing a list of exhibitors and their exhibits, and where to find them, a plan of the show, a programme of the music performed by Godfrey's band, and an account of the history and progress of the society, the whole making up a very interesting booklet.

We cannot pass without a word or two of praise to those who have worked so strenuously to secure the success of this wonderfully fine show. The whole of the officers and council of the society fulfil their duties admirably, but everyone knows that the bulk of the work falls upon the shoulders of the Rev. W. Wilks, Mr. S. T. Wright, Mr. Gaskell, and Mr. Reader. Mr. H. B. May and Mr. H. J. Veitch also help very materially. To all these, however, the success of the show is the greatest and highest commendation they can receive. To the Benchers and officers of the Inner Temple thanks are also due for the loan of their gardens for the Temple Show.

The Queen, accompanied by the Princess Victoria, visited the exhibition on Tuesday morning. Her Majesty was received by Sir Trevor Lawrence, Bart., president, Sir Albert Rollit, Mr. J. Gurney Fowler, Mr. H. J. Veitch, and other members of the council, and, under their escort, made a tour of the tents and inspected the collections arranged in the open. On leaving, her Majesty graciously expressed her appreciation of the great excellence of the exhibition.

ORCHIDS.

A group that attracted an unusual amount of attention was the large and bold one set up just inside the entrance to the big tent by Mr. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester. It was a beautifully arranged display, but it lacked something of the brilliant colouring associated with some of Major Holford's finest efforts. It was a cool and graceful group, in which odontoglossums were a chief and very fine feature. Every plant in the group was grandly grown, so there is no need to say



TEMPLE SHOW—NEW HARDY SHRUB, RHUS SINICA.
Messrs. Paul and Son, Cheshunt.

the odontoglossum spikes were good. A few of the finer forms, all of light hues, were O. c. Zoe, O. c. Fairy Footsteps, O. c. Madonna, O. c. Corsair, O. c. Mrs. Lindsay, and O. c. Panther. Then there were the cattleyas, such as C. Reineckiana, C. Mendeli, in fine form; C. Mossiæ Prospero, C. Mossiæ Baroness, and the hybrids, Brasso-cattleya Digbyana-Mossiæ Westonbirt var., with eight very large, bright, and finely-fringed flowers; L.-c. Aphrodite, Cattleya Dusseldorfi Undine, and L.-c. Fascinator nobilior, with thirteen very large and beautiful flowers. Other very fine things were Miltonia vexillaria Westonbirt variety, with two spikes of its butterfly marked blooms; a big specimen Miltonia with twenty-eight spikes of glorious flowers; the yellowish Brasso-cattleya Minerva, and the fine crimson-lipped Lælio-cattleya Aladdin Westonbirt variety. There were heaps of other good things, and it would be easy to say twice as much about this superb exhibit did not limits of space forbid.

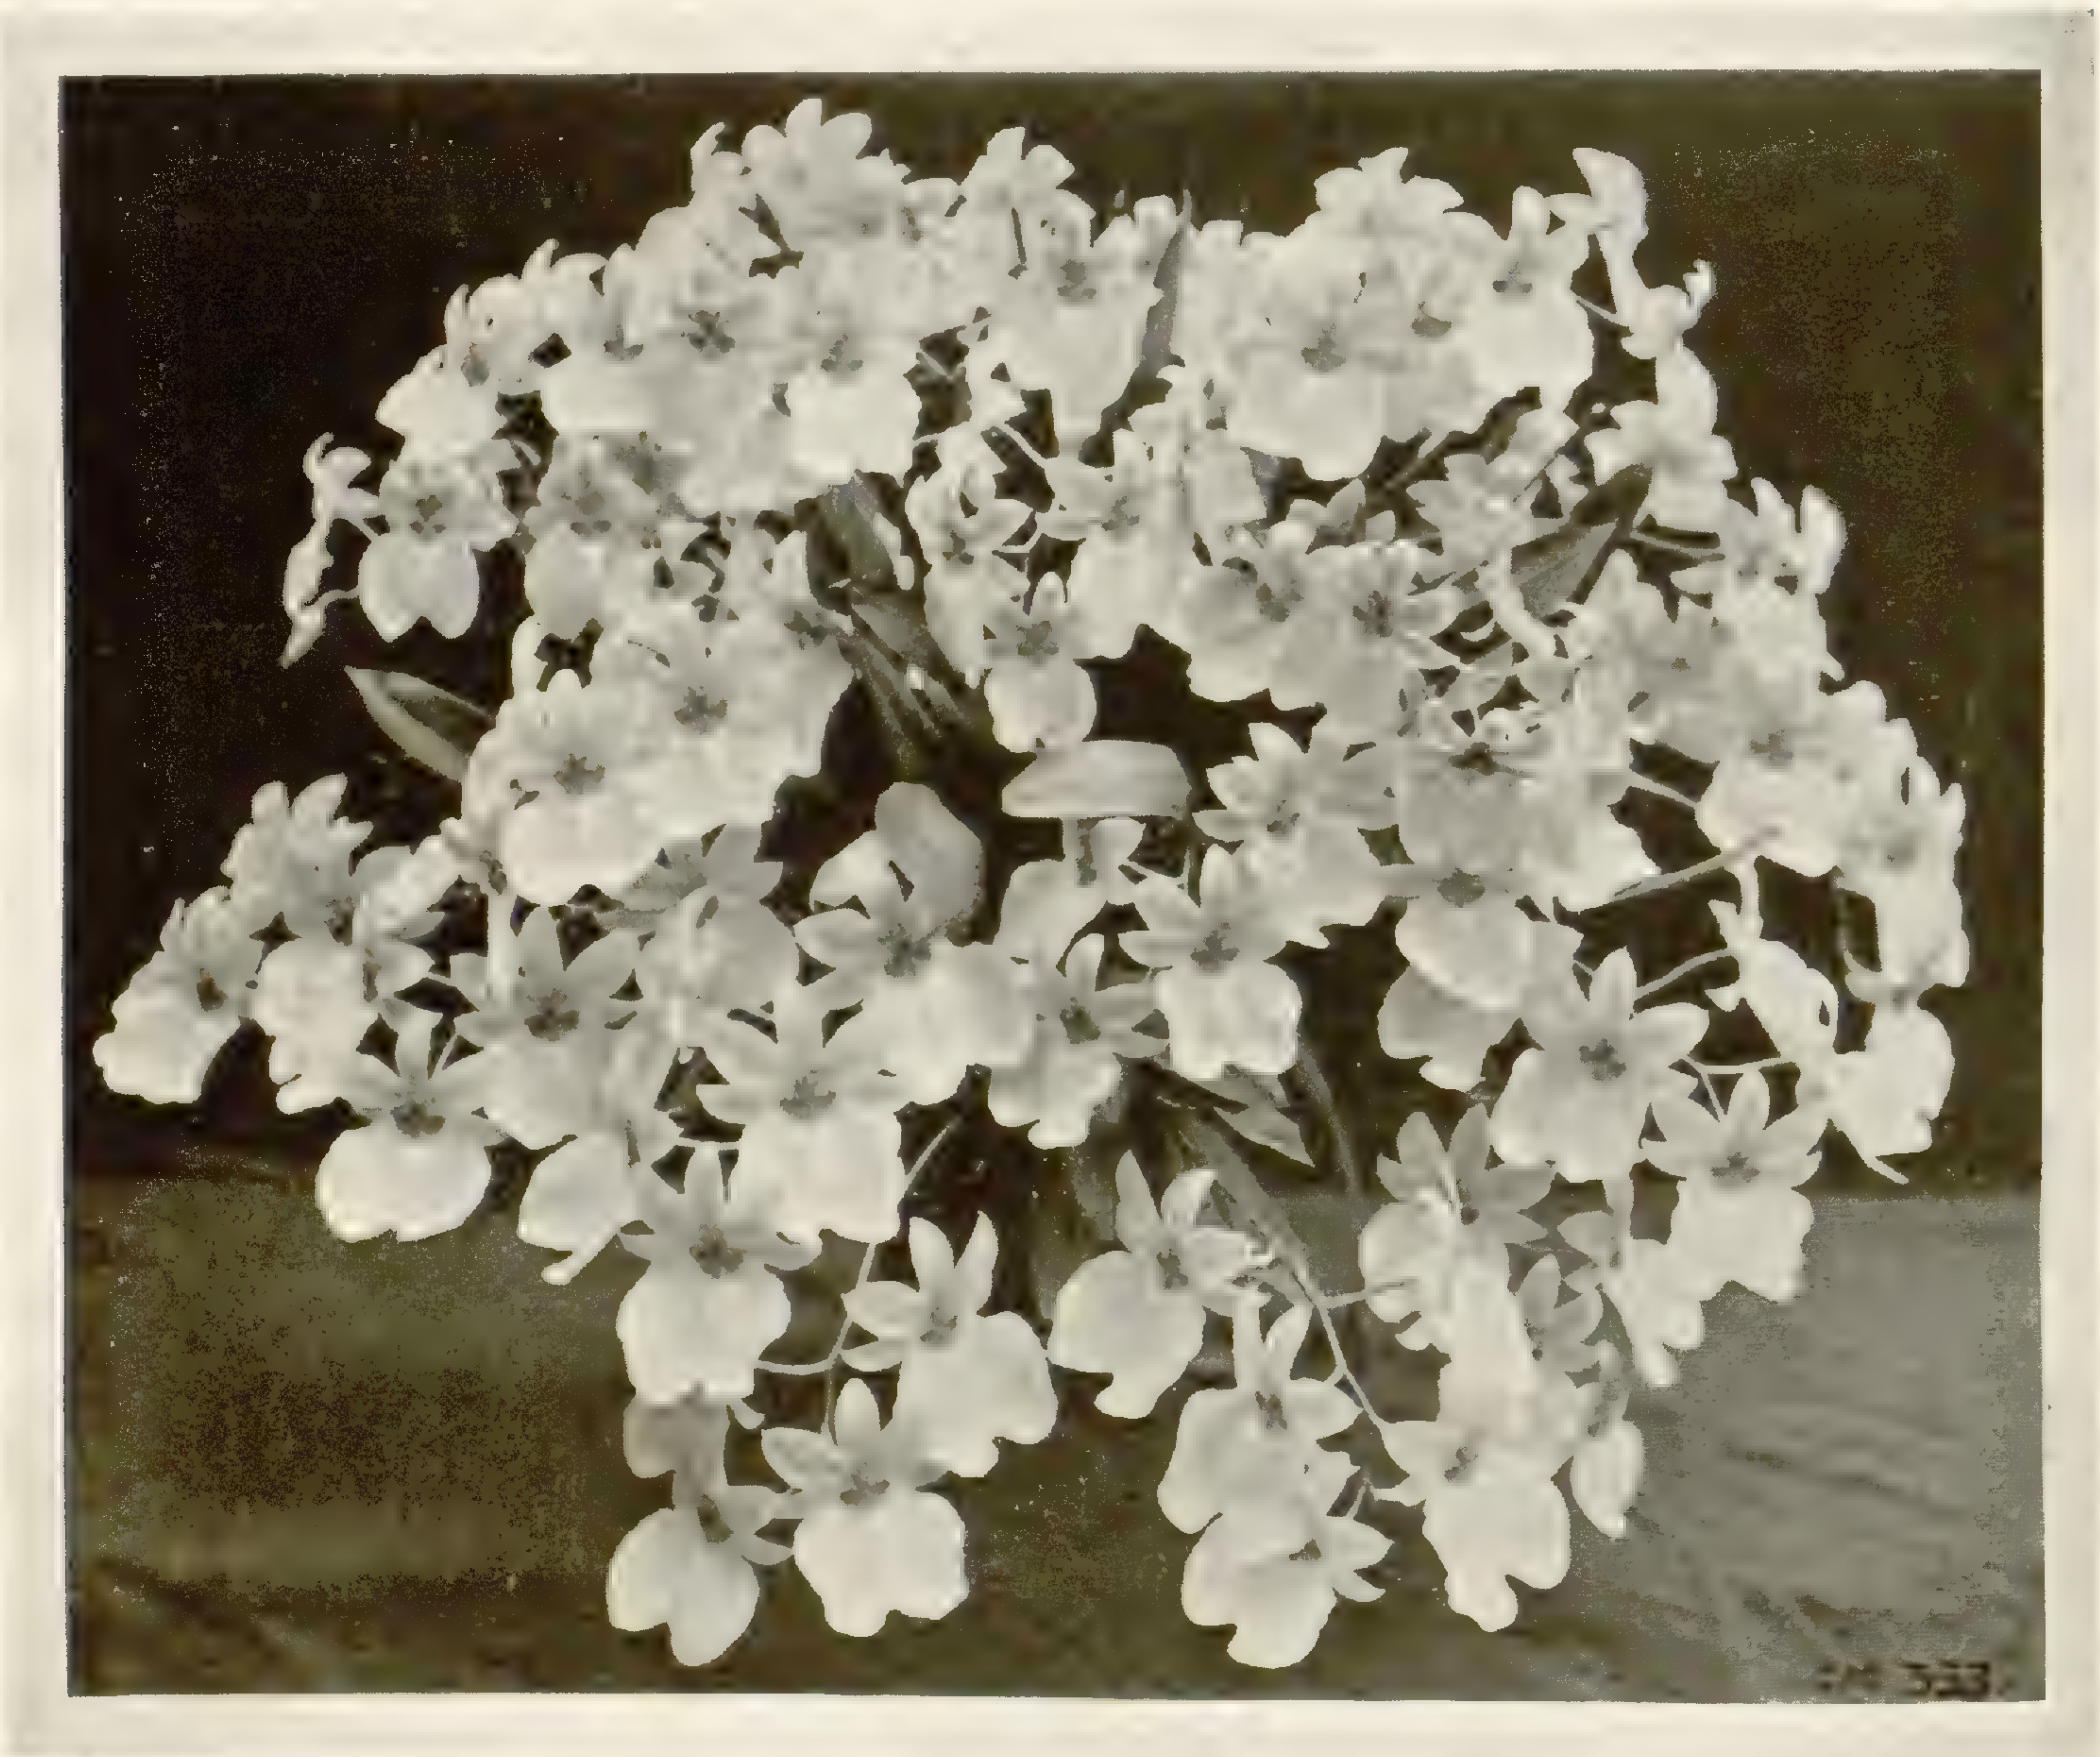
As usual, Messrs. Sander and Sons, St. Albans, contributed a big, interesting, and beautiful display of orchids. Ferns, asparagus, and palms formed a delightful background and groundwork for the gorgeous orchids, and we were glad to find these used more freely than usual, and also to find the arrangement of the group more informal than previously. It is difficult to know where to begin to discuss so rich and interesting a contribution. A batch of Phalænopsis Rimestadiana made a graceful central group, and around this were grouped Miltonia vexillaria in variety, Cattleya Skinneri, the pendant spikes of Dendrobium densiflorum, and D. thyrsiflorum, and the newer D. Brockhardti, Masdevallia ignea, and M. Harryana, with Renanthera Imschootiana and Cochlioda Noezliana, gave touches of brilliant colour that served to show up the lighter odontoglossums, and the splendid forms of Cattleya Mendeli, C. Mossiæ, C. Mrs. Myra Peeters, and Lælia purpurata. Of special interest, beauty, and merit were Cymbidium Sanderæ, a beautiful white orchid with yellow and crimson marked lip; the black and green Cœlogyne pandurata; Cypripedium Godefroyæ leucochilum; the graceful Odontonia Lairessi; the white, erect-spiked Diacrium bicornutum; the dwarf rosy-coloured Bifrenaria Harrisoniæ pubigera; and such glorious odontoglossums as O. eximium, O. crispum transcendens, with scarlet-brown markings; O. c. festivus, a beautiful O. Lambeauianum, O. excellens, O. c. Mauretania, and O. c. Lusitania.

Messrs. Jas. Cypher and Sons, Cheltenham, were again extensive exhibitors of orchids, and they had a display elevated rather more above the stage than most. In a setting of ferns and deep green moss they grouped a fine assortment of Miltonia vexillaria varieties, these forming the groundwork, so to speak, of the exhibit. The background consisted of some beautiful forms of Lælia purpurata, Cymbidium Lowianum, odontoglossums, and oncidiums. In the centre of the group we noticed Cypripedium Rothschildeanum, Cattleya Dusseldorfi, Odontoglossum excellens aureum, O. amabile cærulescens, Oncidium Kramerianum, and Lælio-cattleya Highburyensis. At one end of the group Cypripedium bellatulum, O. caudatum, Zygopetalum citrinum, the quaint and sensitive Bulbophyllum barbigerum, Masdevallia Wagneri, and the beautiful Lælio-cattleya Ganymede were shown together.

A finely arranged exhibit of well-grown orchids came from Mr. Balmforth, gardener to F. Menteith Ogilvie, Esq., The Shrubbery, Oxford. Miltonia vexillaria was splendidly shown, and there was a prominent large specimen of the good old Cattleya Bowringiana. The groups of such albino cypripediums as C. callosum Sanderæ, C. Lawrenceanum Hyeanum, aggregating about fifty blooms, were a great attraction to the specialists. Cymbidium Lowianum, Lælia purpurata, Oncidium macranthum, and O. Marshallianum, formed, with palms and ferns, a background for the general display. Odontoglossums were very numerous, and their graceful spikes added a peculiar grace and charm to the group. A few other specially interesting plants were Cattleya Bowringiana alba, two of Cymbidium Devonianum, Cypripedium May Beatrice, O. crispum Menteith, deeply marked, O. Vuylstekei, a batch of Cypripedium niveum, C. Honoriæ, and a fine O. ardentissimum.

Messrs. William Bull and Sons, King's Road, Chelsea, set up a display of orchids, in which Odontoglossum crispum, Miltonia vexillaria, and fine forms of Lælia purpurata figured extensively. Cattleya Mendeli was also well represented, and there were some excellent varieties of C. Mossiæ. Epiphronitis Veitchi was also conspicuous. The pretty and brilliant hued Odontioda St. Fuscien, a cross between Cochlioda Noetzliana and Odontoglossum Adrianæ, showed the characters of both parents, but C. Noetzliana was predominant. This was shown by Mons. Henri Graire, St. Fuscien, Amiens.

From Gatton Park, Reigate, Mr. W. [illegible] Bound, gardener to Sir Jeremiah Colman, Bart., brought up a large and interesting exhibit of orchids. The background was composed of three groups, the centre one of Cymbidium Lowianum, and the side ones of various orchids, Odontoglossum citrosmum, O. crispum, Cattleya Wm. Murray, and Miltonia vexillaria figuring largely in them. The central foreground was made up with cymbidiums, notably C. Lowio-eburneum, and Masdevallia Harryana Bull's Blood variety, and Cochlioda Noetzliana. At either end [illegible] odontoglossums were conspicuous, and with these the beautiful Spathoglottis aurea and S. Colmani were very fine. A few [illegible] plants we noted were Cypripedium [illegible] lum, Cattleya Arnoldiana magnifica, L.



TEMPLE SHOW—A SPLENDIDLY-FLOWERED SPECIMEN OF MILTONIA VEXILLARIA IN MAJOR HOLFORD'S COLLECTION OF ORCHIDS.

This specimen was growing in an 8-in. pan, and had 28 spikes with an aggregate of 134 flowers.

[illegible] Lady Eldridge, the vivid orange-coloured Sophro-lælia Psyche, Miltonia Bleuiana Gatton Park var., Cymbidium Colmaniæ, the golden Odontoglossum [illegible], Cirrhopetalum pulchrum, and the curious Bulbophyllum vibrans.

A very fine exhibit of orchids was arranged by those famous hybridists Messrs. Charlesworth and Co., Heaton, Bradford, whose display was a large one, and contained many rare and beautiful plants, set up above ferns. Vandas, Oncidiums macrantha and Marshallianum formed a pleasing background to a whole host of novelties. This was one of the finest contributions ever made by the Heaton firm, and one that the enthusiasts as well as the general public lingered long over. It is quite impossible to enter into every detail of the exhibit, but we pick out a few of the most striking features. These were Odontioda Charlesworthi, brilliant crimson-scarlet with yellow crest, one of the startling orchids of the Temple Show; Odontoglossum crispum President Fallières, the red colouring almost covering the flower; the lovely orange-hued L.-c. Eleanor Gloria Mundi; Odontoglossum hibernicum (Halli x hastilabium), O. Othello, heavily blotched; O. crispum Czarina, Miltonia vexillaria alba, O. crispum Queen Maud, O. Eleanor (cirrhosum x Uro Skinneri), Trichopilia Backhousiana, Læliocattleya callistoglossa ignescens, O. Warnhamense, O. Phœbe, and a big specimen Cattleya Skinneri.

A graceful bower-like group of odontoglossums was set up by Messrs. J. and A. McBean, Cooksbridge, Sussex. These were, naturally, very fine, both in flower and spike, and they were mostly unblotched varieties. Oncidium superbiens was fine, and so were the Cattleya Mendeli varieties, Cypripedium bellatulum, Cochlioda Noetzliana, and a finely blotched O. crispum named O. c. F. H. Sander.

Messrs. Moore, Lim., Rawdon, Leeds, contributed a display of considerable beauty and interest. Cymbidiums and oncidiums formed an effective background, Cattleyas Schroderæ, Mossiæ, and Mendeli, formed the groundwork, and over these came choice odontoglossums, etc. Renanthera Imschootiana shone brightly in the middle, surrounded by blotched O. crispum, O. Phœbe, O. Ossulstoni, O. amabile, O. Loochristiense, O. Lambeauianum, and O. Wilckeanum. Other good things were Cœlogyne pandurata, Dendrobium Victoria Regina, Cypripedium Queen of Portugal, Disa Veitchi, and Angræcum Sanderianum.

Messrs. Armstrong and Brown, Tunbridge Wells, put up a very distinct exhibit, consisting of an elevative forward central group, and a deep bay on either side. Taking the centre first, it had Cœlogyne Dayana at its highest point, with Cymbidium Lowianum concolor below it, and fine spikes of Odontoglossum percultum, O. Wilckeanum Urana, and O. ardentissimum Mrs. Temple. In one bay were Cypripedium Rothschildeanum, C. Curtisi superbum, C. Lawrenceanum, and on the other side were C. bellatulum, C. Orphanum, C. callosum Sanderæ. Anguloa eburnea and [illegible] fragrans were other good and interesting plants.

In the large display submitted by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, there were many large plants of Cattleya [illegible], Cymbidium Lowianum, Cattleya Mendeli and Epidendron prismatocarpum. Odontoglossums were excellent, and included a wonderfully fine pure white crispum with [illegible] flowers, and O. Pescatorei virginalis—very beautiful. The forms of Cattleya Mendeli were very fine, as were C. Mossiæ [illegible], Diacrium bicornutum, Renanthera Imschootianum, Cattleya Mossiæ The [illegible], with a grand lip. Dendrobium [illegible], Cypripedium Lawrenceanum Hackbridgensis, Dendrobium Bronck[illegible], D. Bensoni x anthinum, and Oncidium [illegible].

Mr. H. J. Chapman, gardener to Norman [illegible], Esq., Oakwood, Wylam-on-Tyne, showed the beautiful Odontoglossum crispum [illegible], carrying six lovely richly marked blooms of finest form. A wonderfully beautiful Cattleya Mendeli named His Majesty, one of the most beautiful of varieties we have seen, was exhibited of Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking; it has splendid blush sepals and petals, and a white, yellow-throated, purple-tipped lip.

Very fine were the odontoglossums shown by Mr. Chas. Vuylsteke, Loochristy, Ghent; these were O. Queen Alexandra, O. Laudatum (A.M.), finely formed and deeply coloured; O. luxuriosum, a brilliant odontoglossum, O. infuscum, and the beautiful O. crispum Rainbow. M. Jules Hye, Ghent, showed Miltonia Memoria G. D. Owen, O. crispum F. K. Sander, and O. Emma, very bright. Mr. Day, gardener to H. J. Goodson, Esq., Putney, showed Odontoglossum crispum President Fallières, large, prettily marked flowers on a huge spike, and also O. c. Goodsonæ.

In the group of orchids staged by Mr. John Robson, Altrincham, Phalænopsis Rimestadtiana was particularly fine; those were associated with a goodly assortment of odontoglossums, and a few dendrobiums, and masdevallias. R. Ashworth, Esq., Ashlands, Newchurch, showed the curious and pretty Odontoglossum crispum Marjorie, O. Pescatorei Charlesworthi, the rosy O. c. Heliotropium, and O. c. virginalis. The beautiful Vanda teres was finely shown by Mr. W. Lovett, gardener to Mrs. Collingwood, Lilburn Tower, Alnwick.

SWEET PEAS.

Sweet peas are no longer a novelty at the Temple Show, and the beautiful flowers exhibited rather made one fancy that it was July instead of the end of May. Mr. Robert Sydenham, of Birmingham, set up a nice collection of cut blooms arranged with their own foliage. Conspicuous amongst the varieties were Scarlet Gem, Dorothy Eckford, Paradise, Gladys Unwin, Miss Willmott, and White Spencer.

Messrs. E. W. King and Co., Coggeshall, Essex, were represented by a very tasteful display of sweet peas, the flowers being fresh and good throughout. They were arranged in an artistic manner, and the varieties which showed up most conspicuously were Mrs. William King, a very bright shade, Frank Dolby, Countess Spencer, Dorothy Eckford, Flora Norton, Queen Alexandra, Nora Unwin, and Helen Pearce.

In connection with the exhibit of sweet peas from Mr. Breadmore, of Winchester, we heard nothing but praise, and to say that it was well deserved is not exaggerating in the slightest degree. Beautiful indeed were the large flowers mounted on long footstalks, and the stamp of quality denoted good cultivation. The varieties which attracted most attention were Mrs. Collier, which comes as near to yellow as any variety we have, Helen Lewis, Countess of Northbrook, Etta Dyke, very fine, George Herbert, Helen Lewis, King Alfonso, and Princess Victoria. Taken as a whole, it is doubtful whether finer flowers were ever shown in May.

TEMPLE SHOW—NEW ROSE WHITE DOROTHY.
Messrs. B. R. Cant and Sons, Colchester. (Award of Merit.)

The collection of sweet peas from Dobbies, of Rothesay, was not large, but the flowers were very fresh, and the variety pleasing. Particularly attractive were The King, a bright crimson; Burpee's White Spencer, Helen Lewis, Menie Christie, Prince Olaf, James Grieve, King Edward VII., Burpee's Primrose Spencer, D. R. Williamson, and Hannah Dale.

Messrs. G. Stark and Son, Great Ryburgh, Norfolk, had a very interesting exhibit of sweet peas, in which a number of novelties were represented, including Maggie Stark, a new scarlet seedling, Nell Gwynn, Miss Willmott, Olive Ruffell, and Giant Blush Spencer, altogether a very effective display.

FRUIT AND VEGETABLES.

A Temple Show without pot fruit trees from Sawbridgeworth would seem wanting in one of its regular features, but there is little fear of such a thing, and again Messrs. T. Rivers and Son were represented by finely fruited specimens of peaches and nectarines, amongst which were noticeable the Cardinal nectarine, and Duke of York peach. Cherries were represented in the group, and a small collection of oranges fruiting in pots added considerably to its interest.

An element of variety was presented in the long tent by a display of fruit from Laxton Brothers, of Bedford, in which strawberries, peaches, and nectarines were the predominating features. Amongst the latter fine specimens of Early Alexander peach and Cardinal nectarine were shown in baskets, and amongst the varieties of strawberries we noticed Laxton's Epicure and Bedford Champion, the plants in pots showing the free fruiting characteristics of the varieties. We may add that the varieties Epicure and Connoisseur are remarkable for their very fine flavour.

Once more Messrs. G. Bunyard and Co., of Maidstone, demonstrated to the public that they can not only grow fine apples, but also that they know how to keep them. So fresh and firm did the apples look that it was difficult to realise that they were grown in 1907, and as a demonstration of what can be done with proper storage the exhibit was most educational. There was no lack of variety, and amongst others in fine condition we noticed specimens of Smart's Prince Arthur, Belle de Pontoise, Calville Malingre, Belle du Bois, Newton Wonder, Striped Beefing, Norfolk Beefing, and Bramley's Seedling. An element of variety was added by a few fruiting cherry trees in pots.

There is a proverbial connection between Suttons and potatoes, and in addition to an interesting collection of plants, comprising members of the Solanum family in pots, the famous Reading firm exhibited a collection of potatoes grown under ordinary frame culture, and the produce of tubers planted in February last. A large number of varieties were represented, including May Queen, Harbinger, Myatt's Ashleaf, Northern Star, and others now in general cultivation. The exhibit was set up in Messrs. Suttons' usual tasteful style.

Considering that French gardening has been brought very much to the notice of the man in the street of late, it is not surprising that the products of the system were represented. Messrs. Watkins and Simpson represented the French system with vegetables and salads packed in small market crates which bore the name of J. N. Harvey, The French Garden, Evesham. Carrots, lettuces, and turnips were shown, and in the centre of the exhibit were two dozen heads of early Six-weeks cauliflower, shown in good condition.

The collection of salads and forced vegetables from the Thatcham Fruit and Flower Farm, Newbury, would have looked better if they had occupied a little more space. The lettuces of cos and cabbage varieties looked crisp and fresh, and the same may be said of the bunches of radishes, carrots, and turnips. Parsley was freely used for garnishing.

Size was a striking feature about the heads of asparagus which came from Burwell, Cambridge, and were shown by Mr. R. Stephenson, and large bundles of this delicious vegetable were staged by Mr. W. Godfrey, Colchester, and Mr. A. J. Harwood, of the same place.

TULIPS.

Evidence of the popularity of tulips was given in the expressions of approval one heard in front of Messrs. Barrs' collection of these interesting and showy flowers. It was indeed a fine exhibit, and well set up. Some of the visitors favoured the showy and ragged parrot tulips, while others found delight in the fascinating English tulips, with their numerous and varied shades of colour. We were much taken up in this section by Andrew Hunter, King of the Universe, Beauty of Litchchurch, and Sulphur. Not less striking was the fine display of cottage tulips, which made a show in themselves, and conspicuous amongst them were Golden Spire, Salmon Prince, Pararoma, Ellen Willmott, Inglescombe Yellow, and the White Cygnet. Completing the collection was an interesting collection of May-flowering Darwin tulips, in which the dark-flowered Zulu and the Crimson Salmon King were most effective.

Two tulips which attracted much attention was a new late variety called Red Standard, and a fine yellow flower Walter T. Ware, both staged by Messrs. W. T. Ware, Lim., of Bath.

Messrs. Richard Smith and Co. set up a nice collection of tulips, in which several sections were represented, but in the case of several of the varieties the flowers were a little too open.

Quite a pleasing exhibit of tulips was that staged by Messrs. W. Bull and Sons, Chelsea, though the arrangement was a little too stiff. Some of the dark varieties were very effective, and included Zulu, Nigretta, and La Tulipe Noire; while others which attracted attention were Mrs. Moon, yellow, Clara Butt, Salmon Queen, Orange Queen, and Prince of Orange. Lovers of tulips found plenty to interest them in this collection.

Mr. John Walker, of Thame, Oxon, showed a very interesting group of florists' tulips. Size and quality were noticeable in the flowers, and the chief varieties were Surpass Calpuda, George Hayward, George Brown, and Gold Cup.

Old Ireland was represented in the way of tulips by Messrs. Hogg and Robertson, Dublin, and except for a little overcrowding the display was very effective. Beautiful amid a blaze of colour were the following showy varieties: Columbus, Zomerschoon, Ellen Wilmott, Macrospila, Chameleon, Mrs. James Robertson, and Margaret. The flowers throughout were of high quality, and shown in the pink of condition, despite the fact that they had travelled from Dublin.

Mr. A. M. Wilson, of Spilsby, set up a very fresh-looking exhibit of tulips, shown on long foot-stalks. Amongst the varieties we noticed Red Dragon, Coquette, Walter T. Ware, Mrs. F. Sanders, Scarlet Emperor, Millett, The Fawn, Orange King, and Yellow Picotee, were all shown in good condition.

Messrs. Alexander Dickson and Sons, of Belfast, made a very fine display with their tulips, and the flowers were displayed in a very fresh condition. Amongst the Darwin varieties Sunset stood out conspicuously, and The Rev. H. H. D'Ombrain, Dom Pedro, Clara Butt, King's Court, Zulu, Tara, and Gorgeous were much admired. Orange King is a very showy May-flowering tulip, and we were also taken up with Bouton d'Or in the same section. Taken as a whole, this exhibit was highly interesting and attractive, and it afforded a good idea of the supply of material that the firm must have to draw upon.

Small collections of tulips came from Mr. Amos Perry, of Enfield, and at each end of a big collection of herbaceous plants the colours of the flowers were very telling. A small but interesting collection of old English tulips were staged by the Hon. A. H. T. de Montmorency, Dublin. Parrot tulips, Darwins, and other forms were well shown by Messrs. George Bunyard and Co., Maidstone, and in the collection Lutea vitellina, Bouton d'Or, Picotee, Billietiana, and Gala Beauty were much admired.

ROSES.

Exquisitely beautiful and delightfully fragrant was the splendid group of roses set up so well by Messrs. Wm. Paul and Son, Waltham Cross. As evidence of the modern trend of opinion, the rambling roses were a leading feature, and the big pillar plants wreathed in flowers of great brilliance were one of the glories of the show. A few of the loveliest varieties were Tausendschon, a grand rose, Minnehaha, the bright single Hiawatha, Kathleen, the ever-popular Dorothy Perkins and Lady Gay, the graceful and bright single-flowered Paradise, and Crimson Rambler. Below these delightful plants were pot plants of such splendid large-flowering roses as the blush-coloured Pharisaer, the white Frau Karl Druschki, the rosy Dr. William Gordon—very fine, the new white Elaine, Antoine Rivoire, the brilliant Etoile de France, Mrs. John Laing, David R. Williamson, Mdme. Abel Chatenay, Mdme. Fanny Gillemot, Marquise Litta, and Mina Barbanson, all first-rate varieties, and all famously grown and shown.

Mr. G. Prince, Oxford, had a pretty exhibit of roses in the big tent. There were standards, and pillars of Dorothy Perkins, Lady Gay, Hiawatha—very fine, Philadelphia, Tausendschon, and Blush Rambler; these were set over smaller plants, and in the foreground were fine cut flowers of light-hued tea and hybrid tea roses. Messrs. H. Cannell and Son, Swanley, were also exhibitors of roses, and their exhibit consisted of a brilliant and well grown batch of the dwarf and fine Maman Levavasseur, a useful dwarf variety. Behind these were taller examples of Dorothy Perkins, Debutante, Hiawatha, and the large single variety American Pillar, all clothed with beautiful blooms.

Messrs. Wm. Cutbush and Son, Highgate, contributed a beautiful display in one corner of the big tent, using big palms as a background, with a few Ghent azaleas to lend colour, they grouped in the foreground big batches of roses and carnations. The whole group was bedded with the dwarf polyantha rose Mrs. W. H. Cutbush, and tall arching plants of Hiawatha and Paradise rose well out of and above the other things. The carnations in small groups of a variety were chiefly Baldwin, the bright scarlet King Arthur, the yellow Cecilia, the orange-hued Pasha, the big pink Mrs. Martin R. Smith, and the crimson Maggie Hodgson. The whole made up a graceful and effective display.

In their usual place in the big tent Messrs. Paul and Son, Cheshunt, put up one of the best of displays, contributing standard and pillar roses in great variety, with small plants of the larger flowering varieties arranged below and in front of them. Of course, Dorothy Perkins and white Dorothy, and Hiawatha were very much in evidence; and Lady Godiva and Goldfinch were fine, and the standards of larger varieties were chiefly [illegible] Paula, Mdme. de Watteville, G. L. Pa[illegible] and very beautiful. Among the newer roses represented by smaller plants were David Harum, Souvenir de Pierre Notting, Queen of Spain, Richmond, Dean Hole, Dorothy Page Roberts—a lovely H.T., and Lady Roberts. The whole exhibit was delightfully staged and it attracted a great deal of attention.

Messrs. B. R. Cant and Sons, Colchester, were represented by an attractive exhibit of roses, wherein such rambling roses as Hiawatha, Dorothy Perkins, Evangeline, The Garland, White Dorothy Perkins—very fine, Blush Rambler, and Tausendschon, were used effectively as a graceful and beautiful background. Among the lovely cut blooms in the front of the group we noted specially the flowers of Marechal Niel, Mdme. Ravary, Anna Olivier, Marquise Litta, Killarney, Bessie Brown, Frau Karl Druschki, Papa Lambert, King Cole, and Prince de Bulgarie.

We always expect great things from Mr. George Mount, of Canterbury, in the way of roses, but this year his contribution was far and away the finest he has ever put up at a Temple Show. In variety, arrangement, and cultivation it was a grand effort. Dorothy Perkins and its white counterpart, with Crimson Rambler and Hiawatha, were used as arches to form an attractive background. In front of these the large quantities of glorious blooms of the exquisite new Joseph Lowe, pink that is sure of a good future, because Mr. Mount has shown it so well; Frau Karl Druschki, the brilliant Liberty, and Richmond, Mrs. John Laing, Mrs. Sharman Crawford, Caroline Testout, and Ulrich Brunner were other grand varieties, and every bloom was perfect and set on a long stem, with ample healthy foliage—a superb rose exhibit.

At the extreme end of the long tent [illegible] Messrs. Hobbies, Lim., Dereham, set [illegible] large crescent-shaped exhibit of roses. The plants were largely tall standards and pillars, and Dorothy Perkins and Lady Gay [illegible] those tall standards were specially [illegible] pillars were chiefly Hiawatha, but D[illegible] was a favourite with most visitors, its [illegible] dant single rose-pink flowers attract[illegible] great deal of attention. The dwarf or [illegible] ture standards, and the dwarf plants [illegible] drift, were other features of this big dis[illegible]

A charming display of roses was [illegible] the top tent by Messrs. Frank Cant [illegible] Braiswick Nurseries, Colchester. The [illegible] was a long narrow one, and right up ag[illegible] the tent roof were arches of the leading rambling roses, smothered in flowers; there were Hiawatha, Dorothy Perkins, White Dorothy, Philadelphia, Tausendschon, and Minnehaha. Below the arches were plants of Austrian Copper, the new Baby Rambler, Killarney, Mrs. F. W. Flight, Lady Roberts, J. B. Clark, Irish Elegance, Countess of Derby, Florence Pemberton, etc., etc. Cut blooms of leading varieties were distributed along the foreground in vases and in boxes. Looking right along this lengthy exhibit of roses a very beautiful view was obtained, especially from the entrance end, and the Messrs. Cant are to be congratulated upon arranging such a lovely display in such a position.

A fine group of roses from Mr. Chas. Turner, Slough, contained fine standards of Bessie Brown, Mrs. Sharman Crawford, Niphetos, Souvenir de Pierre Notting, Mrs. J. Laing, and Dorothy Perkins. Crimson Rambler as dwarf plants were a brilliant feature, and Stella was also good.

ALPINES AND ROCK PLANTS.

In making a review of this section it may safely be said that alpines were as largely represented as ever, and there was no falling off in the interest displayed by the public in these popular plants. As usual, the gems of the alpine section were made to look as natural as possible by being shown in temporary arrangements of rockwork, and one interesting exhibit was that set up by the well-known firm of Messrs. Barr and Sons. Along the front of the table were tiny primulas, myosotises, Iberis pinnata, and others, phloxes in variety, saxifragas, and other favourites, while an interesting background was formed by fine spikes of Gladioli Blushing Bride, Ackerman, and Peach Blossom. Aquilegias were effective in this collection, and especially pleasing were the plants of Primula japonica, and the collection of ixias in variety.

Amongst the rock plants shown by Messrs. Geo. Jackman, Woking, were some nice plants of Saxifragas longifolia and granulata flore plena, and a pretty little phlox called Sprite.

By no means the least interesting collection of rock and alpine plants was that staged by the King's Acre Nursery Company. The arrangement was effective, and the flowers that appeared to attract the most were Phlox canadensis Laphami, Saxifraga cotyledon pyramidalis, Incarvillea grandiflora, and Cheiranthus Allioni. In the centre of the display was a rockery mound on which phloxes, alyssums, aubrietias, cyclamen, dodecatheons, silenes, and primulas, formed the chief furnishing material.

Cork bark and tufa were employed to advantage by Messrs. Baker, of Wolverhampton, in arranging their rock plants, and the little gems looked very natural amid their artificial surroundings. Charming in their simplicity were such plants as Saxifraga moschata atropurpurea, Achillea rupestre, Aubrietia Fire King, sempervivums in variety, Viola pedata, Lithospermum prostratum, and many others.

A feature in the big exhibit from Messrs. Carter and Co., Holborn, was the collection of alpine and rock plants. Nestling in naturally arranged pockets were the principal gems of the section, including Saxifraga pyramidalis, Achillea rupestris, Anthemis aizoon, Phlox Nelsoni, Gentiana verna, and a host of others. By a clever manipulation of moss, cork bark, and tufa, the plants were shown to advantage, and every specimen could be seen and examined without difficulty.

A very pretty little arrangement of rockwork was set up by the Craven Nursery, Clapham, Yorks, and conspicuous amongst other pretty things were Androsace villosa, Edraianthus serphylifolius, and Gentiana verna. At the end of the rockery the above firm also had a very fine bank of the white Trillium grandiflorum, which was much admired.

We are quite within the mark in saying that one of the most complete and interesting rock-work arrangements was that made by Messrs. J. Cheal and Sons, Crawley. tufa was employed with advantage and little pools of water held the aquatic plants. Saxifragas, trilliums, primulas, and, in fact, most of the gems of the alpine section were shown, and the crowd of people round the exhibit showed how much they admired it.

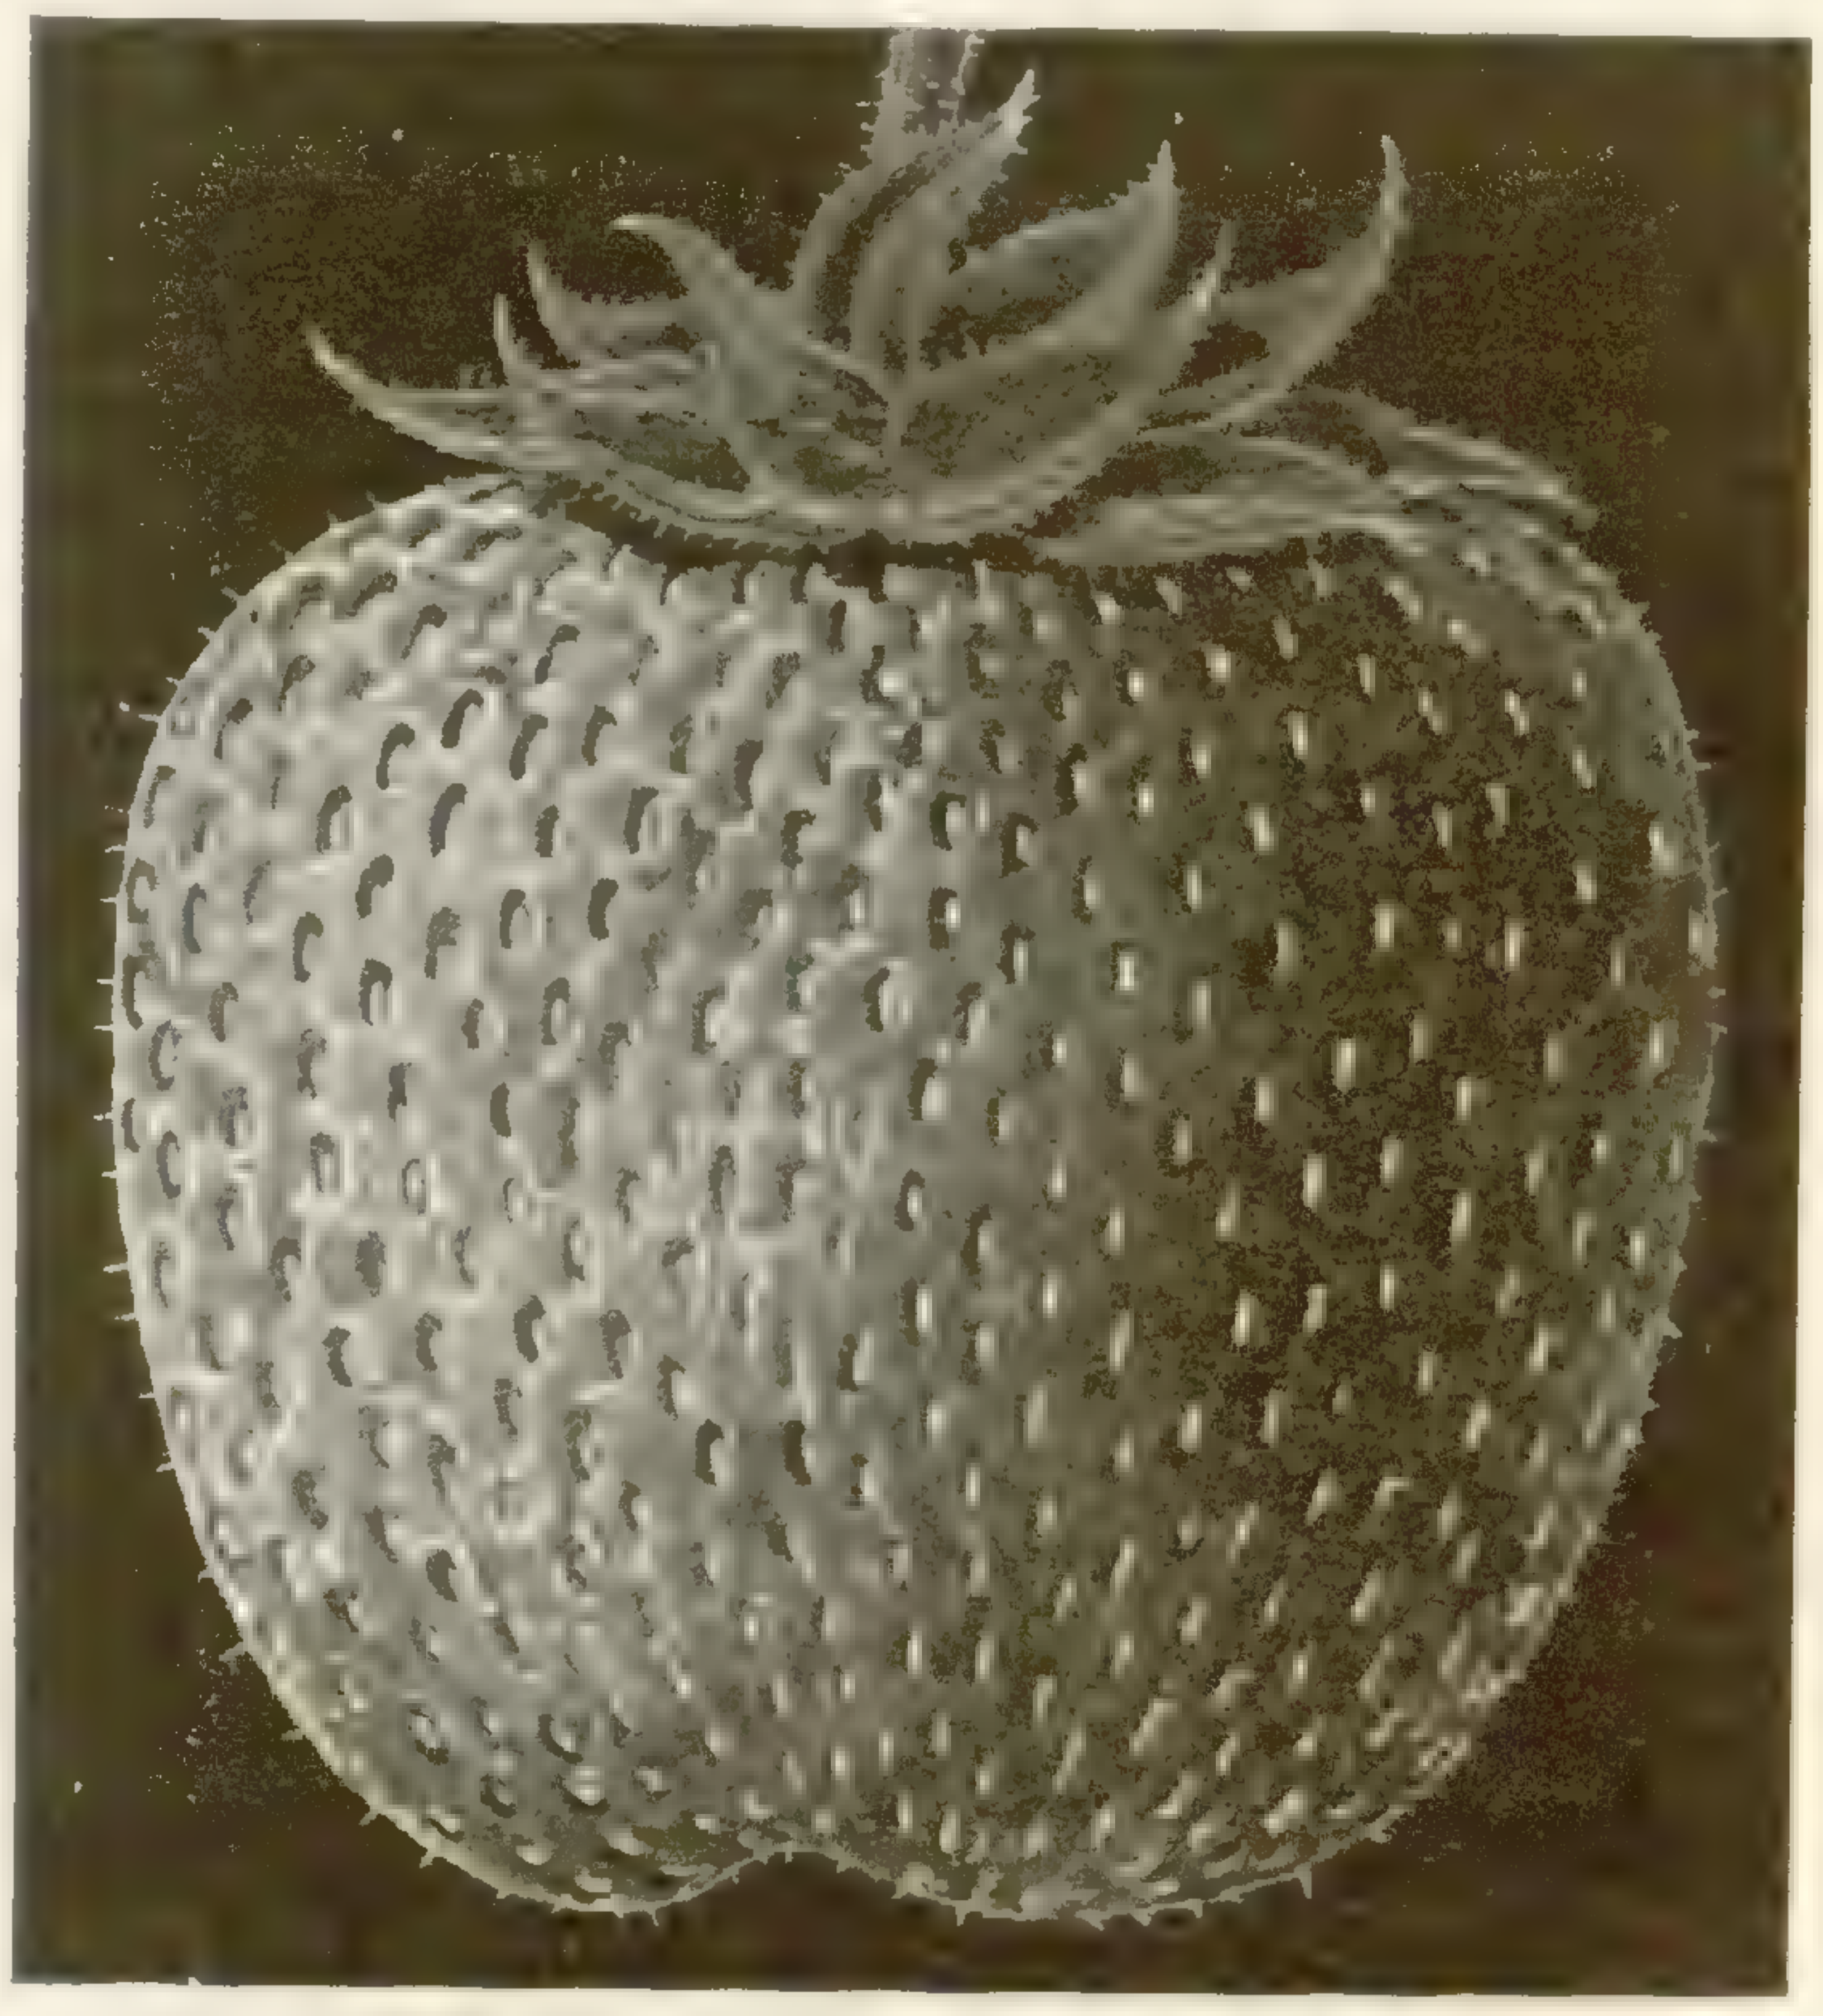
Very natural are the words which best describe the rockery set up by Mr. J. R. Box, of West Wickham. Stone and water were quite in place, and, as there was not too much of the latter, the flowers stood out, and were seen to great advantage. Iberises were attractive in the exhibit, as also were dwarf phloxes, sempervivums, arenarias, and epimediums. The exhibit as a whole reflected great credit on the firm. Messrs. T. Ware had an interesting collection of alpines which formed part of a large and varied exhibit.

A very pretty rockery was set up by the Misses E. and M. Kipping, Hutton, Essex. Tall subjects were arranged as a background, and along the front, nestling in little pockets amongst blocks of stone and tufa, were a number of alpine plants of varying character. The usual run of rock plants were represented, and the way they were displayed reflected great credit on the Misses Kipping. Mr. G. R. Reuthe, of Keston, staged a choice collection of alpines, in which phloxes, saxifragas, and linarias figured with modest effect. The Misses Hopkin, of Shepperton-on-Thames, won a Banksian medal with a very nice rock garden arrangement. Stones and plants were artistically placed, and rock plants, Messrs. Baker, of Wolverhampton, made an attractive display with Lilium croceum, Trollius europæus, Primula pulverulenta, Saxifraga pyramidalis, Incarvillea Delavayi, Aquilegia Stuarti, Lupinus Moerheimi, Phlox canadensis, and Trillium grandiflorum. The flowers all through were very fresh, and the arrangement pleasing.

Primulas Sieboldi, Mrs. Brownhill, Arthur, and others were features in the collection of plants and flowers staged by Messrs. W. Artindale and Son, Sheffield, but there were many other charming subjects, including aubrietias, daphnes, alyssums, phloxes, and cypripediums. A few hardy ferns were dispersed amongst the flowers, and looked pleasing by contrast.

From Messrs. Reamsbottom and Co., Alderborough Nurseries, Ireland, came a delightful exhibit of anemones. The colours were extremely bright, and the flowers, which were well set up, were much admired.

Messrs. George Bunyard and Co. had a fine display of hardy flowers, which were set up without the overcrowding which is often noticeable in this class of exhibit. Delphiniums, pyrethrums, eremuri, papavers, irises, pæonies, and lupins were represented in great variety, and the flowers in all cases were very fresh. Included in this exhibit were amongst other things was a pretty pink daisy called Alice.



TEMPLE SHOW—NEW HIGHLY-FLAVOURED STRAWBERRY EPICURE.
Messrs. Laxton Brothers, Bedford.

The Guildford Hardy Plant Company had a very effective rockery, in which many gems were represented, including saponarias, daphnes, ajugas, oxalis, and Androsace sarmentosa. There was nothing flat or monotonous about the arrangement, and every plant showed itself to advantage. Messrs. G. and A. Clark, Dover, set up a small rockery, which contained the usual subjects, and in addition a pretty rare plant in the shape of Mimula cupreus. The same firm also staged an interesting collection of sempervivums.

HARDY FLOWERS.

Interesting, varied, and tastefully arranged were the cut flowers in the exhibit of Messrs. George Jackman and Son, Woking. There were flowers of the yellow Trollius Orange Globe, further on Lupinus polyphyllus, and close at hand a pretty collection of gladiolus, including Pink Perfection, Peach Blossom, Blushing Bride. Pyrethrums were attractive, particularly the variety Mrs. Bruce Findlay, while also interesting were the irises, liliums, the latter in pots, and the as yet somewhat uncommon Rehmannia angulata.

As a background to their arrangement of well flowered specimens of Astilbe Peach Blossom.

Mr. Amos Perry, of Enfield, had a fine display of hardy flowers, in which we noticed irises in variety, and Papaver Crimped Beauty. In the firm's exhibit was an interesting collection of water lily flowers in variety, with a big Gunnera manicata at the back. Mention must also be made of the liliums, which were represented in great variety, and plants that attracted a good deal of attention were the dodecatheons of different kinds. The varieties of Phlox canadensis were very charming, and eremurus spikes stood up boldly above the other things. Altogether this was a most varied and interesting exhibit.

Messrs. B. Ladhams, Lim., Southampton, made a big display of hardy flowers, amongst which were represented Rehmannia angulata, Aquilegia Stuarti, Primula japonica, Incarvillea grandiflora, Anchusa italica, Lupinus Rose Queen, and aquilegias in variety.

A selection of beautiful rhododendron flowers figured in the exhibit staged by Mr. G. Reuthe, Keston, and another unique feature of the group was Myosotidium nobile. Primulas and gentians were much admired, and as a whole the exhibit was a highly interesting one.

Mr. H. C. Pulham, of Elsenham, Surrey, sent a small collection of hardy flowers taken from trees and shrubs, the chief subjects being azaleas, lilacs, and staphylea. Quite a unique exhibit was the display of oriental poppies set up by Mr. W. J. Godfrey, Exmouth. Solanum Wendlandi was also represented, and the exhibit as a whole attracted much attention, though no one seemed to be able to describe the colour of the poppies.

Messrs. J. Cheal and Sons, Crawley, had a pretty exhibit of lupins, which included the varieties polyphyllus, and its white form Lupin polyphyllus albus. Tree pæonies and violas were included in the exhibit.

Messrs. Gunn and Sons, Olton, Birmingham, were responsible for a beautiful display of phloxes, amongst which we noticed White Swan, Eclaireur, Le Soliel, Mrs. Miller, and Rosy Gem. Viola cornuta purpurea was also a feature in this exhibit. Mr. N. Lowis, of Bridgewater, had a pretty show of anemones, the bright colours of which were much admired.

A long length of tabling was filled by Mr. M. Prichard, of Christchurch, with hardy flowers, conspicuous amongst which were Eremurus robustus, German irises, scillas in variety, pyrethrums, and poppies.

Mr. R. C. Notcutt, of Woodbridge, had a large exhibit of hardy flowers. White broom in the centre was very effective, and other flowers that were admired were Kalmia latifolia, Phlox canadensis, and Cerasus J. H. Veitch.

The chief items of interest in the collection from Lilley's Bulb Nursery were Iris pavonia, the Peacock iris, Arum crinitum, the green tulip, and the green ixia. These novelties attracted the attention of visitors, particularly the peacock iris and the green ranunculus. Included in the exhibit were some fine tulips, including Crested Crown, ixioides, and Velvet Gem. Altogether this exhibit was quite unique.

A rather unique exhibit was a little collection of seedlings of the Blue Poppy, Meconopsis racemosa, staged by Lady Northcliffe, Guildford.

Messrs. Paul and Son, Cheshunt, sent a very interesting collection of lilacs, and in the exhibit were plants of Catalpa syringæfolia pulverulenta, and a fine specimen of the beautiful white Hydrangea arborescens grandiflora alba.

Messrs. Gilbert and Son, of Dyke, Lincs, made a pretty display with anemones, amongst which the white and scarlet varieties, both doubles and singles, were much admired.

Messrs. G. and A. Clark, Dover, had a big collection of hardy flowers, which contained amongst other things different varieties of trollius, German irises, geums, pyrethrums, and aquilegias. Rhododendrons, azaleas, and other hardy flowers were well shown by Messrs. W. H. Rogers and Son, Lim., Southampton.

Messrs. W. Paul and Son, of Waltham Cross, had an exhibit of cut lilacs and rhododendrons. The variety was considerable, but the flowers would have been seen to better advantage if they had been given more space.

A brilliant and interesting group of hardy flowers came from Messrs. R. Wallace and Co., Colchester. At one end they had a group of the fine blue Anchusa Opal, and, passing along the group, we noted the pretty Papaver Rose Queen, Eremurus himalaicus, E. robustus, Colvillei forms of gladiolus, the vivid Habranthus pratensis, a selection of Spanish irises, German irises, ixias, liliums in great variety, Incarvillea Delavayi, the new pink spiræa Queen Alexandra, Primula sikkimensis, and a little group of pretty hardy orchids, and ferns, Pæonia decora alba, and Primula japonica in variety. With these beautiful herbaceous and alpine plants the Messrs. Wallace showed a small selection of May-flowering tulips, their set containing such superb varieties as Inglescombe Pink, Clara Butt, The President, Walter T. Ware, Orange King, Fairy Queen, Inglescombe Yellow, King Harold, and Red Cardinal.

Messrs. T. S. Ware, Lim., Feltham, showed a large collection of hardy flowers, and a few carnations. They had a selection of German and Spanish irises, Delphinium Persimmon, Trillium grandiflorum, Meconopsis cambrica, Conandra ramondiodes—very rare, and Anchusa italica Dropmore variety.

AZALEAS AND RHODODENDRONS.

A gorgeously beautiful exhibit of Ghent and mollis azaleas, arranged by Messrs. R. and G. Cuthbert, Southgate, in the big tent, was a great attraction. Tall standards rising well above the bushes, gave the display a lighter effect than it would have possessed without them. The fine Anthony Koster made a fine corner group, while the light and beautiful Magnifica filled up the centre front. Graciosa, a new white, lemon tinted variety; Nancy Waterer, golden-yellow; Fanny, a single rosy-hued Ghent variety; Raphael de Smet, double pink; and Peter Koster, orange, were a few of the finest of a fine set, though one cannot omit the exquisite lemon-yellow Mdme. A. Koster, a large-flowered mollis variety.

Messrs. George Jackman and Son, Woking, showed some well-flowered specimens, which were the result of crosses between Azaleas mollis and sinensis. The varieties which took our attention most were President Carnot, Anthony Koster, Dr. Reitenbach, and Mrs. A. E. Endtz. The same firm also staged a number of Ghent azaleas, amongst which we noticed Pallas, of an orange shade of colour, and Narcissiflora, a creamy yellow. Conspicuous also in this exhibit were fine trusses of Rhododendron Pink Pearl.

A bank of Azalea rosæflora was staged by Messrs. J. Backhouse and Son, Lim., York. The pretty semi-double flowers of this azalea are freely produced, and the plant has a dwarf, compact habit.

The group of bold and beautiful rhododendrons submitted by Messrs. J. Waterer and Sons, Lim., Bagshot, was a very fine one. Quite naturally Pink Pearl was a feature of the exhibit, its big trusses of lovely pink flowers placing it ahead of all others. Marquis of Waterford, Mrs. Holford, the deep and brilliant pink Cynthia, Frederick Waterer, scarlet; Strategist, Doncaster, and Helen Waterer were other splendid varieties of these magnificent hardy flowering shrubs.

A great variety of colour was presented by the rhododendrons in pots staged by Messrs. H. Lane and Son, Great Berkhamsted. Conspicuous also were plants of the golden-yellow azalea Anthony Koster. Amongst the rhododendrons Purity, Blandyanum, and Lady Grey Egerton were a few of the most attractive varieties.

Mr. R. Gill, of Penryn, Cornwall, had a very interesting display of rhododendrons and other flowers. Amongst the former were R. Manglesi, Falconeri, Dalhousei, Aucklandi, and others, and amongst the most admired flowers was Embothrium coccineum. Clianthuses puniceus and puniceus alba also attracted attention.

Choice flowering shrubs, climbers, etc., were largely shown by Messrs. James Veitch and Sons, Chelsea, in the big tent. This firm relied on the mollis azalea Anthony Koster and the beautiful Pink Pearl rhododendron for colour. A few of the newer things were Actinidia chinensis, Clematis montana rubens, the lovely little Cytisus Beani, grown as a standard, Primula pulverulenta, P. sibirica chinensis, P. Veitchi, Rheum Alexandræ, with big pale green bracts all up its spikes; Viburnum rhitidophyllum, Ceanothus Veitchianus, and Vitis megalophylla. The brilliant Embothrium coccineum, several clematises, and tree pæonies were also good and effective. Indian azaleas, as pyramidal specimens were exhibited by Mr. Charles Turner, Slough, and the chief varieties were Spitfire, Prince Albert, Roi d'Holland, and Madame Van Houtte.

FERNS.

Ferns were superbly shown by Messrs. H. B. May and Sons, Edmonton, who had a large exhibit of fine specimens of Gmynogramma schizophylla gloriosa, the bold Asplenium magnuatum, the drooping Goniophlebium subauriculatum, Polypodium glaucum cristatum, Polypodium Knightiæ, the beautiful Nephrolepis Whitmani, N. exaltata superba, N. Scotti, Platycerium alcicorne, Davallia dissecta, adiantums in variety, and a host of other lovely graceful varieties.

Messrs. J. Hill and Sons, Lower Edmonton, put up a bold exhibit of exotic ferns, that contained good examples of Platycerium grande, Nephrolepis todeaoides, Lygodium scandens microphylla, Davallia dissecta elegans, Nephrolepis Amerpohli, and the beautiful Adiantum Veitchianum, etc.

STOVE PLANTS.

A superb group of stove plants was finely arranged by Messrs. Jas. Veitch and Sons, Chelsea. The display was composed of a central group of orchids, in which odontoglossums and oncidiums figured largely, and this was flanked by the leading perpetual carnations in small groups, but the bulk of the exhibit consisted of splendidly grown examples of Nepenthes Mastersiana, Caladiums Rose Laing, Mdme. Schmidt, Gaspard Crayer, Louis van Houtte, Baron Rothschild, The Mikado, Raymond Lemonier, Dracæna Doucetti de Groot (F.C.C.), a rather broad-leaved form of Doucetti, Medinella magnifica, beautiful single-stemmed Croton caudatus tortilis, Dracæna Sanderiana, Alpinia Sanderiana, Aralia elegantissima, and Cynophyllus magnificum. The newer nephrolepis were represented, and the palms and ferns were used freely among the brighter things, the whole making up a very glorious display.

A giant specimen of Heliconia illustris, with handsome red-green leaves and lighter veins, made a fine centrepiece to a group of stove plants set up in the big tent by Messrs. Wm. Bull and Sons, Chelsea; Dracæna Laudeni, Anthurium crystallinum, crotons, a few caladiums, palms, tree ferns, and bertolonias completed the exhibit. Messrs. John Laing and Sons, Forest Hill, S.E., contributed a display of caladiums, mostly of half specimen size, and representing such varieties as Gerard Dow, Reine de Danemark, Major Joicey, Mikado, Mdme. Schmidt, Gaspard Crayer, and B. S. Williams. A comparatively small group of caladiums was set up by Messrs. J. Peed and Son, West Norwood, who had grand specimens of such splendid varieties as Mdme. Marie de Flacourt, Mdme. J. R. Box, Candidum, John Peed, Mikado, Oriflamme—very bright, Racine, lovely pink and red; Maria Mitzana, rich bronzy-red, Ladas, and Lord Penhryn. The big leaves with their beautiful texture and grand colouring still attract a great deal of attention. Messrs. Sander and Son, St. Albans, set up a group of their new plants, including the new Croton Fred Sander, Furcræa Watsoniana, the elegant Polypodium Knightiæ, Bougainvillea glabra Sanderiana variegata, the bold-leaved Anthurium Sanderi, the red-leaved Vitis atro-rubens, Pereskia Godseffiana with variegated leaves, Iguanura Rex—a bold palm, and the handsome Pandanus Sanderi superba with yellow variegation.

BEGONIAS.

Wonderful was the colouring seen in the splendid group of tuberous begonias set up by Messrs. Blackmore and Langdon. The frilled or fringed varieties were exquisitely beautiful, especially in the single varieties, of these latter the yellow Mrs. Pankhurst, the white Mr. Justice Darling, and the orange Mrs. Coles Child, and the pink Mdme. Tetrazzini, were the best. Among the grand round-flowered doubles we picked out Mrs. J. B. Blackmore, Mrs. W. L. Ainstie, Colonel Turner, Pink Pearl, Empress Marie (A.M.), white; Rev. Canon Horsley, and White Swan as of exceptional merit in a grand collection.

Mr. J. R. Box, West Wickham, submitted a very handsome collection of double and single tuberous begonias in a great variety of forms and colouring; their Lady Fexton, Prince Fushima, Gold Mine, Lady Donaldson, and Lady Kerry were among the good things.

Messrs. Thos. S. Ware, Lim., Feltham, had a beautiful group of tuberous begonias, set up rather flatly, but containing a number of splendidly formed and exquisitely coloured varieties. A few of the best were Rhoda Pope, King Edward VII., Hon. Mrs. M.

Glyn, orange-salmon, Countess of Dartmouth, a lovely cream; Beatrice Pardy, pure white; and Countess of Ilchester, pale yellow, and Lord Cromer, with double pink flowers, perfect in form, and about six inches in diameter. Mr. A. L. Gwillim, Cambrian Nursery, Eltham, showed splendid double and single begonias, that in form, size, and colour gave ample evidence of close selection and fine cultivation.

CLEMATISES.

Clematises were beautifully shown by Messrs. Geo. Jackman and Son, Woking, who had a fine set of varieties, all in the pink of condition. Fortunately, the plants were not formally trained. Lady C. Neville, Nelly Moser, Mrs. Hope, Mrs. G. Jackman, Fairy Queen, Ville de Lyon, vivid rose-red; Wm. Kennett, Lady Northcliffe, a grand blue; Jackmani rubra, brilliant ruby-crimson; Lord Neville, blue; and Hovevi, white, were a few of the best. The contribution of clematises from Messrs. Richard Smith and Co., Worcester, was an attractive one, and the plants were well flowered and very fresh. There were arches, pillars, and trained specimens, representing King Edward VII., the bright blue Sensation, Mrs. G. Jackman, Fairy Queen, Marie Lefebvre, Nellie Moser, Lady Caroline Neville, President, and Gloire de St. Julien.

CARNATIONS.

A grand group of carnations in pots, shown by Mr. A. Grubb, gardener to Cecil F. Raphael, Esq., Shenley, Herts, was a fine sight, and showed that Mr. Grubb is a master of Malmaison carnation culture, and also of perpetual varieties. The white Malmaison, Princess of Wales, King Arthur, and Maggie Hodgson were the varieties displayed. Malmaison carnations and tree pæonies were well shown by Mr. W. H. Smith, gardener to W. James, Esq., Chichester; the carnations needed a few more days to be at their best, but the huge flowered pæonies were gorgeously beautiful.

Magnificent blooms of carnations in considerable variety were shown in elegant glass on long footstalks by Mr. W. H. Lancashire, Victoria Vineries, Jersey. Mr. A. J. Paskett, gardener to E. J. Johnstone, Esq., Groombridge, set up a fine lot of plants of Carnation Burrswood Scarlet, a fine flower, but rather wanting in scent. Mr. C. H. Herbert, Birmingham, sent fine flowers of a new perpetual-flowering pink carnation called Progress.

Mr. A. F. Dutton, Iver, Bucks, had one of his fine exhibits of perpetual-flowering carnations, showing large vases of fine blooms of Imperial, Lady Bountiful, Melody, Mabelle, Mrs. T. W. Lawson, Red Riding Hood, and President.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, were extensive exhibitors of perpetual carnations, and they arranged these in vases and tall stands over maidenhair fern. They had Autocrat, Marmion, Mrs. Burnett, Victory, Lady Bountiful, Winsor, Britannia, and Beacon in fine style.

Perpetual carnations were superbly shown by Mr. W. H. Page, Tangley Nurseries, Hampton, who had grand vases of Lady [illegible], Aristocrat, General Roosevelt, White Enchantress, Winsor, and the old [illegible] Pike.

Mr. C. F. Waters, Balcombe, Sussex, had a beautiful lot of carnations, showing the leading varieties in fine style, his Marmion, White Perfection, Princess of Wales, Autocrat, and Aurora were very good.

Mr. H. Burnett's group of carnation blooms brought over from Guernsey were very fine, and he had grand flowers of Marmion, Aurora, Winsor, Autocrat, Mikado, Enchantress and Mrs. Burnett. Mr. G. Engelmann, Saffron Walden, had a small group of carnations, and he also exhibited large bunches of the leading kinds.

Messrs. Bell and Sheldon, Guernsey, showed a beautiful lot of perpetual-flowering carnations, setting up fine flowers in large vases; Sensation, Lady Bountiful, Autocrat, Evangeline, and all the popular varieties were present.

Mr. S. Mortimer, Farnham, Surrey, exhibited a bank of carnations just inside the second big tent, and he also had a beautiful lot of flowers of the leading varieties set up in large vases.

GREENHOUSE PLANTS.

We must congratulate the King's Acre Nursery Company, Hereford, on the very effective way in which their exhibit of petunias, heliotropes, schizanthuses, and carnations was set up. The pretty little Begonia Bronze Beauty was put in as groundwork, and rising above it were banks of Schizanthus Wisetonensis, with crimson Carnation Prime Minister behind. Very large-flowered heliotropes in a number of more or less distinct varieties, and a delightfully pretty deep pink new single petunia called the Countess of Chesterfield, were included in the group. The whole of the upper end of the big tent was filled by Messrs. Sutton and Sons, Reading, in their usual superb style. The central group was a semi-circular one of the firm's fine new selection of Stellate cinerarias, including the pretty cactus-flowered varieties; the new mauve shades were a great attraction, and the delicate perfume was also a noted feature. On either side of the cinerarias there were big groups of glorious and gorgeous calceolarias, remarkable for their wonderful colouring and spottings, and one of these banks was surrounded by a splendid set of double begonias, some of the blooms measuring nearly seven inches across. The other group was surrounded by gloxinias of splendid habit and colour, not a single flower requiring support. The lovely schizanthuses, particularly the new retusus forms, the hybrid nicotianas, and Nemesia strumosa in great variety added to the many other attractions of this beautiful exhibit.

Succulents and cacti were submitted by Messrs. H. Cannell and Son, Swanley, but vastly more attractive than these were the firm's calceolarias, their big-headed hydrangeas, the gorgeous cannas, and their group of the graceful and effective Fuchsia Coralle, an orange-flowered variety of much merit.

At the end of an exhibit, which included a variety of flowers, Messrs. Richard Smith and Co., of Worcester, staged a few calceolarias of moderate quality. A number of well-grown plants of the new pink-tinted spiræa Peach Blossom were staged by Messrs. W. Bull and Sons, Chelsea. Messrs. Pope and Son sent plants of a new double clematis called King's Norton. The Hon. Mrs. Evelyn Cecil, Eaton Place, staged plants of Gloriosa lutea collected in Rhodesia.

Very quaint and interesting were the sarracenias shown by Mr. A. J. A. Bruce, Chorlton-cum-Hardy, who, as usual, had a very good collection of these carnivorous plants. Darlingtonia californica, Dionæa muscipula, and a set of droseras were shown with the Side-saddle plants.

A fine bank of schizanthuses in pots was set up by Messrs. J. Garraway and Co., Bristol. The plants were very well grown, and the colours varied. Messrs. Jarman and Co., Chard, sent flowers of their fine new Centaureas Bridegroom, The Bride, Honeymoon, and Bridesmaid. Mr. Vincent Slade, of Taunton, was responsible for a comprehensive collection of single and double zonal pelargoniums, the trusses of which were very fine. Beautiful lilacs were shown by Mr. T. Jannoch, Dersingham, Sandringham, and the fragrance was as delightful as the colour and grace of the flowers; Marie Legraye, Charles X., Louis Spathe, Louis Henry, and Charles Joly were very fine.

A long length of tabling was filled with gloxinias exhibited by Messrs. John Peed and Son, West Norwood. A good many of the varieties were named, and there were also a good sprinkling of new seedlings. The size of the flowers and the vigour of the foliage were apparent signs of good cultivation, and the mingling of ferns amongst the plants in staging added to the attractiveness of the exhibit. A very pretty group of mixed single petunias came from Mr. W. R. Chaplin, Waltham Cross. A mixed collection of plants, including cactuses, calceolarias, and yellow arums, interspersed with ferns, was set up by Mr. Pitts, gardener to E. Ascheson, Esq., Charing, Kent.

Never did the well-known firm of Carters make a finer show than on this occasion, and one hardly knew which to admire most, the excellence of the plants and flowers, or the artistic way in which they were shown. Baskets of schizanthus hung from archways covered with smilax, and the above greenhouse plant was also well shown in pots. Tuberous begonias were noted for the health of the foliage, the size of the flowers, and the method of arrangement. One recess in the tent was completely filled with cinerarias, all splendidly grown, and representing a striking array of colour. Facing the entrance of the tent was a fine bank of Cineraria stellata, and on one side of the table was a grand collection of gloxinias. Good quality was the stamp of the whole display from beginning to end, and Messrs. Carter and Co. have every reason to feel proud of their effort.

A very unique exhibit was the collection of flower and foliage plants sent by Messrs. W. and J. Brown, Peterborough. Amongst other things a fine basket plant, Lotus pelios hynthus, of pretty pendant habit, was much admired, as also were the Verbenas Miss Willmott, Snowflake, and Heliotrope Lord Roberts. Bakers, of Wolverhampton, had a beautiful collection of violas, one of the most attractive varieties being Jessie Baker, but without exception the flowers were very charming. A bank of beautiful Stellata cinerarias was set up by Mr. G. H. Street, gardener to J. A. Young, Esq., Stone House, Putney; this was a beautiful mass of colour.

Messrs. J. Veitch and Sons had a beautiful bank of plants that were much admired. Streptocarpuses achimeniflorus albus and achimeniflorus gigantus were very fine, and the same remark applied to Cineraria Feltham Bouquet. Richardia Elliottiana was well represented. Variety was supplied in a collection of cannas, and a plant that attracted general attention was Kalanchoe Kewensis. New hybrid gerberas were included in the group, and both Lobelia tenuior, Coreopsis Granti, and Amphicome Emodi were very fine. In short, this fine collection well deserved the gold medal it won.

Mr. Godfrey, Exmouth, set up a good group of pelargoniums, and amongst the best varieties we noticed Mars, Beauty, Dora Godfrey, Godfrey's Pride, and Bridesmaid. Mr. Edwin Beckett, of Altrincham fame, can evidently grow streptocarpuses as well as he can vegetables, and the collection he set up was characteristic for the fine flowers and healthy foliage. The colours were kept distinct, and the effect of the collection was very pleasing.

Very beautiful were the gorgeous amaryllis exhibited in grand style by Messrs. Ker and sons, Aigburth Nursery, Liverpool. They were magnificent in colour, form, and culture. Alba perfecta, Queen of Spain, Jasper, Margot, the latter rich pink varieties, Empress, and Virginia, were all very splendid varieties. In one of their groups, Messrs. H. Low and Co., Enfield, had the beautiful free-flowered Azalea rosæflora, Dracæna Lindeni, fine bushes of the red and white Bottle-brush, the pink spiræa, and some heaths.

A large collection of calceolarias came from Messrs. Webb and Sons, of Stourbridge. There was a good variety of colour, and the finely-flowered plants were extremely well grown. Mr. L. R. Russell, Richmond, set up a group of a striking looking ivy called Hedera dentata variegata.

About twenty grandly grown standard plants of the comparatively new, pink, scented-leaved pelargonium Clorinda were shown by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Herts. These were superbly grown examples, 5ft. to 7ft. high, with heads about 4ft. through, and finely clothed with bloom. Mr. Beckett has demonstrated the value of this variety for conservatory, balcony, and terrace decoration. White spiræas formed a groundwork for the pelargoniums.

A collection of plants in which were gloxinias, came from the Studley College, Warwick, but there was nothing in it which called for particular comment, the plants being quite of an ordinary character.

CUPS AWARDED.

Veitchian Cup. — F. Mentieth Ogilvie, Esq., Oxford, for orchids.

Silver Cups. — Messrs. Sutton and Sons, Reading, miscellaneous; Messrs. Barr and Sons, Covent Garden, herbaceous plants; Messrs. Bunyard and Co., Maidstone, herbaceous plants and fruit; Messrs. J. Waterer and Sons, Bagshot, rhododendrons, etc.; Messrs. H. B. May and Sons, Edmonton, ferns, etc.; Mr. L. R. Russell, Richmond, clematis, shrubs, etc.; Messrs. R. Smith and Co., Worcester, clematis and herbaceous plants; Mr. C. Turner, Slough, roses and azaleas; Messrs. Paul and Sons, Cheshunt, roses, etc.; Messrs. Jackman and Son, Woking, herbaceous plants; Messrs. Pulham and Son, Broxbourne, alpines, etc.; Messrs. J. Cheal and Sons, Crawley, trees, shrubs, and herbaceous plants; Messrs. W. Paul and Son, Waltham Cross, roses, etc.; Messrs. T. Cripps and Son, Tunbridge Wells, acers, etc.; Messrs. R. P. Ker and Sons, Liverpool, hippeastrums; Mr. A. Perry, Enfield, herbaceous plants; Messrs. R. and G. Cuthbert, Southgate, azaleas, etc.; the Hon. Vicary Gibbs, Elstree, pelargoniums and streptocarpus; C. F. Raphael, Esq., Egham, carnations, etc.; Messrs. Blackmore and Langdon, Bath, begonias; Messrs. R. Wallace and Co., Colchester, herbaceous plants; Sir J. Colman, Bart., Reigate, orchids; W. James, Esq., Chichester, carnations and pæonies; Messrs. J. Cypher and Sons, Cheltenham, orchids, etc.; Mr. M. Prichard, Christchurch, herbaceous plants.

MEDALS.

Gold Medals.—Messrs. J. Veitch and Sons, Chelsea, foliage plants, flowers, etc.; Messrs. W. Cutbush and Son, Highgate, roses, carnations, alpines; Messrs. Sander and Son, St. Albans, orchids and foliage plants; Messrs. Charlesworth and Co., Bradford, orchids; Major G. L. Holford, C.I.E., C.V.O., Westonbirt, orchids; Messrs. H. Low and Co., Enfield, orchids, carnations, etc.

Silver Gilt Flora Medal. Messrs. T. S. Ware, Lim., Feltham, begonias, carnations, Messrs. Cannell and Sons, Swanley, roses, calceolarias, cannas, etc.; Messrs. J. Carter and Co., Holborn, flowering plants; Mr. G. Mount, Canterbury, roses; Messrs. Hobbies, Lim., Dereham, roses; Mr. G. Reuthe, Keston, herbaceous plants, etc.; Messrs. A. Dickson and Sons, Newtownards, tulips, Messrs. J. Hill and Son, Edmonton, ferns; Mr. A. J. A. Bruce, Chorlton, sarracenias; Messrs. Armstrong and Brown, Tunbridge Wells, orchids; Mr. H. Burnett, Guernsey, carnations; Mr. A. F. Dutton, Iver, carnations; Mr. R. Ashworth, Newlands, orchids.

Silver Gilt Knightian Medal.—Messrs. T. Rivers and Sons, Sawbridgeworth, fruit trees in pots; Messrs. Laxton Bros., Bedford, strawberries.

Silver Gilt Banksian Medal.—Messrs. J. Peed and Son, West Norwood, caladiums and gloxinias; Messrs. Bakers, Wolverhampton, herbaceous plants, Mr. J. R. Box, West Wickham, begonias, The Craven Nursery Company, Lancaster, alpines; Messrs. Fromow and Sons, Chiswick, trees, shrubs, etc.; Mr. R. Notcutt, Woodbridge, herbaceous plants.

Silver Lindley Medal.—F. Mentieth Ogilvie, Esq., Oxford, orchids.

Silver Flora Medal.—Messrs. F. Cant and Co., Colchester, roses, Messrs. D. Russell and Sons, Brentwood, trees, shrubs, etc., Messrs. J. Laing and Sons, Forest Hill, begonias, caladiums, Mr. C. W. Breadmore, Winchester, sweet peas, Mr. A. R. Upton, Guildford, herbaceous plants; Messrs. Webb and Son, Stourbridge, calceolarias; Messrs. B. R. Cant and Sons, Colchester, roses, Messrs. Dobbie and Co., Rothesay, violas, etc.; Messrs. Hogg and Robertson, Dublin, tulips, Messrs. J. and A. McBean, Cooksbridge, orchids, Mr. J. W. Moore, Rawdon, orchids, Mr. R. Gill, Penryn, rhododendrons.

Silver Knightian Medal.—Thatcham Fruit Farm Co., Thatcham, vegetables; Mr. Stephenson, Burwell, Cambridge, asparagus.

Silver Banksian Medal.—J. D. Enys, Esq., Penryn, Myosotidium nobile; Mr. W. P. Horton, Seaford, alpines; The King's Acre Nurseries, Hereford, herbaceous plants; Mr. A. M. Wilson, Spilsby, tulips; Messrs. W. Bull and Sons, Chelsea, orchids, foliage plants; Mr. H. Crane, Highgate, violas; the Misses Hopkins, Shepperton, alpines, etc.; Mr. F. Lilley, St. Peter's, Guernsey, bulbous plants; Mr. G. Prince, Longworth, roses; Messrs. Watkins and Simpson, Covent Garden, vegetables; Messrs. R. H. Bath, Wisbech, tulips and carnations; Mr. A. L. Gwillim, Eltham, begonias; Mr. A. J. Harwood, Colchester, asparagus; Mr. T. Jannoch, Dersingham, lilacs, etc.; Mr. B. Ladhams, Shirley, herbaceous plants; Mr. W. H. Page, Hampton, carnations; Messrs. Bell and Sheldon, Guernsey, carnations.

CERTIFICATES AND AWARDS.
ORCHID COMMITTEE.

First-class Certificate for Odontioda Charlesworthi, from Messrs. Charlesworth and Co.; Cypripedium ventricosum, from Messrs. W. Cutbush and Son; L.-c. Elva Westonbirt var., from Major Holford; Cattleya Mendeli His Majesty, from F. Wellesley, Esq.; Odontoglossum illustre var. luxuriosum, from Mr. Ch. Vuylsteke, Loochristy; and Odontoglossum eximeum Queen Alexandra, from Mr. Ch. Vuylsteke.

Award of Merit to Odontoglossum Lindeni, from Sir J. Colman, Bart.; Cirrhopetalum pulchrum, from Sir J. Colman, Bart.; Odontioda St. Fuscien, from Mons. H. Graire; Odontoglossum laudatum, from Mr. Ch. Vuylsteke; O. crispum Kenneth, from N. Cookson, Esq.; O. hibernicum, from Messrs. Charlesworth and Co.; Cattleya Mossiæ Le President, from Messrs. H. Low and Co.

Botanical Certificate to Bulbophyllum vibrans, from Sir J. Colman.

Cultural commendation to Miltonia vexillaria, from Major Holford (grower Mr. Alexander).

FLORAL COMMITTEE.

First-class Certificate to Dracæna Doucetti de Grootei, from Messrs. J. Veitch and Co.; Tulip Walter T. Ware, from Messrs. W. T. Ware, Lim.

Award of Merit to Azalea occidentalis graciosa, from Messrs. R. and G. Cuthbert; Begonia Empress Marie, from Messrs. Blackmore and Langdon; Croton Fred Sander, from Messrs. Sander and Sons; Dimorphotheca aurantiaca, from Messrs. Barr and Sons; Pæonia decora alba, from Messrs. R. Wallace and Co.; Rose Elaine, from Messrs. W. Paul and Son; Rose Tausendschon, from Messrs. Hobbies and Messrs. W. Paul and Son; Rose White Dorothy, from Messrs. B. Cant and Co. and Messrs. Paul and Son; Tulip Duchess of Westminster, from Messrs. A. Dickson and Sons.

⁂ We are compelled to leave over the sections devoted to the groups, etc., arranged in the open air, and to miscellaneous subjects. These we shall give in our next issue, with descriptions of new plants, and illustrations of these, and other objects of special merit. The reports of the annual meeting and dinner of the Kew Guild, of the National Tulip Society's exhibition at Westminster, and the Paris spring show will also be given in our next issue.

LEICESTER.—ABBEY PARK FLOWER SHOW will be held on the 4th and 5th August, 1908.

Schedules and full particulars can be obtained from JOSEPH BURTON, Superintendent.

ROYAL OXFORDSHIRE
HORTICULTURAL SOCIETY.
June 23, 1908.

OPEN CLASS. — Group of Stove or Greenhouse Plants:—£15, £12, £8. Also liberal prizes for displays of Roses, Perennials, Dinner Table Decorations, Sweet Peas, etc.

Schedules on application to
W. GREENAWAY (Sec.),
Paradise Square, Oxford.

WOLVERHAMPTON
GREAT FLORAL FETE.
July 7, 8, and 9, 1908.
£800 in prizes. Schedules on application.
W. E. BARNETT, Secretary.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EPIPHRONITIS VEITCHI. — This most interesting bigeneric hybrid, derived from the intercrossing of Sophronitis grandiflora and Epidendrum radicans, is one of the brightest of small growing orchids. When grown into good-sized specimens, and flowered satisfactorily, it is one of the most useful, as well as one of the most attractive; being suitable either for exhibition or for cutting purposes, it deserves a place in all gardens where orchids are appreciated. The season at which the flowers are produced depends entirely on the conditions under which the plants are grown. Our plants are grown in the intermediate house, on the staging during the summer months, and suspended near the roof glass during the winter. It is so placed because during the summer it is in more or less active growth, and I find it produces more satisfactory growths in this position, and I have no doubt the better facilities thus provided for acquiring moisture are of considerable advantage to the plants.

POTTING.—I consider annual repotting advisable, and this is best attended to when the new roots are in an active state, and the plants are usually in condition soon after flowering. They should be turned out of their pots, and, after removal of the old potting compost, any dead and useless matter should be cut away from the base of the stems. To make the plants effective, the strongest stems should be selected and placed several together in the same pot, keeping the weaker growing ones also together. The pots used should be clean, and filled to one-half their depth with clean broken crocks or bracken roots. The compost we find suitable consists of equal portions of fibrous peat, broken leaves, and chopped sphagnum, with sufficient coarse sand added to render the whole porous. The material should be made moderately firm, and the surface covered with chopped sphagnum. The plants should be shaded for a time after repotting, and the atmosphere kept moist about them; syringing overhead will also be found beneficial in bright weather.

INCREASING THE STOCK.—There is no plant I know that lends itself more readily to propagation than this epiphronitis. The stems that have flowered are constantly breaking into new growth, and these growths may be cut off when the roots make their appearance, and potted in the usual way. Strong shoots may be either laid out on a bed of moss, or they may be cut into short lengths and inserted as cuttings in a compost of sphagnum moss and sand, when they readily produce growth.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PELARGONIUMS AND AZALEAS, when they begin to drop their petals, need a good deal of picking over, and when the plants are beyond a certain stage have them removed to another house, if possible. In the conservatory shabby plants should not be tolerated, as they detract from the enjoyment of good specimens. Olearia Gunni is a charming little white-flowered bush, now very effective as a pot plant, and Cytisus Andreanus is a good companion to it. Both should be retained for the unheated conservatory. Well-grown bushes of white marguerites, ivy-leaved pelargoniums, and hydrangeas of any variety, are all easily grown, and help to make a good show.

ASTILBE JAPONICA.—This is one of the most popular plants for early forcing, and if the clumps are potted early in the autumn they may be plunged in ashes or cocoa-nut fibre refuse outside. They will soon commence to root, after which they should not be allowed to get dry. For early forcing they should be placed in heat as soon as they have commenced to root in the pots, but it is best to force gently, as they then flower more freely. When the plants are well furnished with foliage and flowers, place them of water to prevent them becoming dry, as they are difficult to keep sufficiently moist when in full growth. After the flowering season the plants should be divided, planted in good soil in an open position, and given copious supplies of moisture through the summer months. They will repay a supply of liquid manure weekly, and in light soil should be given a mulch of decayed manure. Treated thus they force freely and bloom satisfactorily.

ARUM LILIES.—When grown for the production of spathes under glass, different methods of culture are practised by various growers, some planting them out in trenches of rich soil during the summer months, and others allowing them to remain in their pots and become thoroughly dry before potting. Both plans have their advocates, who testify to the superiority of their course. Good results have doubtless been obtained by the followers of each system, but the thorough ripening of the roots is certainly more in accordance with the conditions experienced by the plants in their native habitat, where, in the hot summer the soil surrounding the roots often becomes parched to a brick-like consistency. Where the system of permanent pot culture is adhered to, the plants may be placed in the open by the end of May. Water should be given in decreasing quantities until the leaves begin to turn yellow, when it must be entirely withheld, and the pots turned on their sides. In this position they should be left until the end of July. The plants should then be turned out, and repotted, using fresh rich soil, and given a good watering. From this time they should not be allowed to become dry, and in about two months they must be housed in a genial temperature and given a plentiful supply of water, with periodical applications of liquid stimulants. Treated in this way the plants will make healthy and vigorous foliage, and commence to throw up spikes in November, and produce their white spathes in quantity for Christmastide.—T. B. **Field**, Ashwellthorpe Hall Gardens.

THE FLOWER GARDEN.

SUMMER BEDDING.—Every preparation for bedding-out should now be completed as soon as possible; if any beds are not yet prepared, no further time should be lost, as when June enters planting may be at once proceeded with, or even earlier in favourable, well-sheltered sites, for all except the most tender plants. By making all preparation possible, the actual work and untidiness of planting is not then so long about, and plants have better opportunity of establishing themselves before the hottest weather ensues. Lawns should be mown, and all beds clipped round with edging shears before other work is commenced. If much traffic has to pass over any part of the lawn, planks should be laid down to protect the grass. The soil in the beds must be in a well pulverised condition, so that it can be evenly firmed down all round each plant. Should the weather be hot and dry do not allow the roots to be exposed a moment longer than necessary, or, in the very hottest hour or two of the day it may be advisable to cease planting and attend to other matters. See that nothing suffers through lack of moisture, though it is not advisable to give heavy soakings of quite cold water direct from the water mains, that which has been exposed to the sun's rays being much more helpful.

HARDENING OFF. — Should any plants not yet be in a sufficiently hardy condition, do not plant them at once, because to take plants direct from warm growing quarters and place them in exposed positions outside, means the disfigurement and loss through sudden exposure of tender foliage. Especially is this so with palms, musas, cannas, and other foliage plants used for subtropical and mixed bedding, and which, if once damaged, take a long time to recover, frequently marring the effect for nearly the whole season. All the more tender subtropical and other bedding plants, such as heliotrope, begonias, ageratum, iresine, coleus, alternantheras, etc., are best kept until about the middle of June before planting. Any of the plants that are plunged in the beds or ground, such as the taller ones used as dot or standard plants in beds or single specimens on lawns, must be so placed that the water may pass freely away from them.

SUCCESSIONAL PLANTS.—Where a full effect is at once required, and one has to be maintained all through the season, successional batches of the chief flowering subjects used as standards or dot plants must be grown for that purpose, and as the sets pass out of bloom they can then be replaced by others; these may be liliums in variety, cannas, gladiolus, fuchsias, lantanas, Plumbago capensis, Campanula pyramidalis, etc. If any calceolarias or Lobelia cardinalis still have to be planted, these should be attended to at once, especially on the lighter warmer soils. Daturas are very noble for use as standards.

PLANTING. — In arranging or planting, site, aspect, locality, and individual taste must all be considered, as often what appeals to one as a very beautiful arrangement, design, or combination, is much less so to another, and the gardener should always endeavour to follow the known wishes of his employers, even though these may not be what he himself would prefer.

ROSES. — Continue to support all rose growths as they advance, also watch for any rust or mildew that may appear, at once dressing with either sulphur or one of the prepared specifics.—E. F. **Hazelton**, Knowsley Gardens, Prescot.

HARDY FRUITS.

VINES.—Where these are grown outside the young growths require great care and attention at this season of the year; disbudding, and the removal of useless laterals must not be neglected, and at the same time suitable young wood for filling up wall space, and for the purpose of replacing older canes must receive careful attention. The main rods ought to be arranged 3ft. apart, and the fruiting laterals on either side at about 14 to 18 inches apart, neatly arranged, and trained to the walls. The points of each lateral should be pinched at one or two joints above the flowers and the sub-laterals, the results of this stopping at one leaf when required. Do not allow the young growths to ramble and become crowded before thinning, and then remove a lot at one time, but make sure of all the leaders, and keep them regularly secured to the walls or trellises. Old vines will be greatly benefited by a good soaking of liquid manure occasionally, especially if the roots are growing in a somewhat restricted border. Mildew later on is one of the worst enemies to contend with, and if not checked will quickly spread and destroy the whole crop. A slight spraying with Bordeaux mixture, or a good dusting with sulphur, distributed with a dredger, are good remedies. Red-spider sometimes attacks the leaves, but if the roots are well cared for, and the vines kept in good health and syringed at intervals with clean soft water, not much harm will be done.

ALPINE STRAWBERRIES, raised from seed sown in heat, should be kept growing in good soil, and when large enough may be planted outside on a rather dry and not too rich border; they should be planted firmly and kept watered if the weather should prove dry. The fruits are much liked by some, although small, and from a bed of healthy plants some good dishes may be obtained.

INSECTS.—Keep a sharp lookout for insect pests on all fruit trees; repeated washings with quassia extract, rather strong soapsuds, or some other suitable insecticide will, in most cases, serve to keep the foliage clean and healthy.

GOOSEBERRIES. — Although the severe weather damaged many things, and our gooseberry bushes were more than once completely covered with snow when in flower, we shall still have a very fair crop. On some bushes the tiny fruits turned yellow and dropped. Where heavily cropped the fruits need to be thinned early. The tiny fruits can be used for making tarts. Those intended for jelly should be picked when the size of hazel nuts, and just before they show signs of colouring, the jelly being much brighter than if the fruits are left until later. We also have a great quantity bottled, and if properly done, the fruit keeps well, and, needless to say, is much appreciated later. Keep a watch for gooseberry caterpillars; a slight dusting with hellebore powder at night and a thorough wash the following morning with clear water will settle them.—H. **Markham**, Wrotham Park Gardens.

ANSWERS TO CORRESPONDENTS.

SUB-TROPICAL BEDDING.—M. C. A., Dorchester: In your district there should be no good reason for delay in placing sub-tropical plants in position for the summer, but it is always a good plan to get out the hardiest subjects first, and leave the most tender until last. By this means the plants receive a full hardening off, and the weather should be more settled by, say, the middle of June. Shelter from strong winds should be provided for sub-tropical plants, because, if they are lashed by the wind they lose a great deal of their beauty and value.

CROWN IMPERIALS.—D. M. P., Knutsford: We have carefully examined the specimens, and find no trace of disease likely to prove the cause of failure. It is possible there may have been some weakening of the bulb during the previous season, as this often results in a number of spindly shoots. The growths should not be removed until they have quite died down. Lift and examine the bulbs after the stems have died down; reject any that seem unhealthy, and plant the others in a group, giving sufficient space to each, so that disturbance is not necessary for a year or two. Select a more open position, and a sunny one, and mulch the plants as soon as growth commences, as it is then the bulbs and roots need some assistance. The winter mulch should be of light material, such as half-decayed leaves or old crumbly manure. The spot occupied by Crown Imperials should be carefully marked with short sticks or labels, as there is great danger of harm being done to them when the border or bed is cleaned and forked over.

SWEET PEAS FOR SCREEN.—B. L., Loughton: Train the strong growths carefully all over the screen, attending to the training every second or third day, as growth is very fast at this season, and the tendrils readily grip neighbouring shoots. Pinch back any weak shoots towards the base, as this will induce new growth that will be of special service in furnishing the lower portion of the screen.

SCHIZANTHUSES.—N. D., Conway: You have made a mistake in keeping the plants more or less shaded. Schizanthuses are sun-loving plants, and at no period of their growth do they need shading, unless it be for a day or so directly after potting, if the weather is bright.

CHOICE TULIPS.—A. E., Salisbury: Your best plan will be to let the choice varieties remain until the leaves have turned yellow and become quite flaccid, before lifting them. If they are carefully lifted as soon as the flowers fade, and laid in in light soil where they will not want for moisture so long as they are green, little or no harm will result; but with choice varieties it is much better to let them remain until the foliage ripens and begins to die down.

EMPLOYMENT AT KEW AND WISLEY.—E., Stoke: For information relative to employment at Kew, you should apply to the Director, Royal Gardens, Kew, Surrey, stating age and experience. For particulars relative to employment at Wisley, you should apply to the secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.

ODONTOGLOSSUM ADRIANÆ.—D. P., March: Odontoglossum Adrianæ is a hybrid between O. crispum and O. Hunnewellianum, and is quite frequently imported. Some odontoglossums regarded as varieties of O. crispum are not infrequently, it is suspected, descendants of O. crispum pollinated with O. Adrianæ.

FAILURE WITH TULIPS.—S. W. T., Sheffield: We cannot tell the cause of failure without seeing bulbs, but we expect the failure is due to the bulbs being too young to flower properly, or to their being insufficiently ripened during the cool, moist season of 1907. As the bulbs were purchased at a sale you cannot recover—indeed, you have no one to complain to. Some cheap goods are very dear.

WHITE EUPATORIUM FOR CHRISTMAS.—C. B. W., Eltham: You probably can obtain cuttings or young plants of Eupatorium Weinmannianum, one of the best of species for flowering, about or before Christmas time. It is usual to put cuttings in early in May, but you need not hesitate to start now if cuttings are procurable. Such cuttings produce root readily in sandy soil in a close pit, or under a handlight in a greenhouse. Striking the cuttings in strong heat is not recommended. During late summer and early autumn the plants may be stood out of doors, but they must not lack moisture, and they must be protected from strong winds. Placed in a warm greenhouse in October, they will soon come into bloom, yielding abundance of sweetly-scented white flowers. The newer E. vernale is winter-flowering, but later than the other, and it has large pale pink flowers. E. riparium flowers in spring. All are easily grown.

WARTED VINE LEAVES.—A. R. G., Swindon: The wart-like processes on the leaves are formed by the plant in its effort to get rid of superfluous moisture. Their presence does not necessarily mean a poor crop of fruit or failing health, as with the brighter weather and more ventilation the balance of moisture between root and leaf will be restored; but the presence of these warts in abundance is evidence of error in cultivation, or in the construction of the border.

TEMPERATURE FOR ORCHID HOUSES.—D. P., Coventry: We do not believe in fixed temperatures; that is to say, we do not agree with the principle of marking the thermometer tab with certain figures and compelling the man in charge to keep the temperature at that figure no matter what the outside conditions may be. The figures should serve as a guide, and provide for a margin either way in accordance with the weather. For the summer season the following figures will serve as such a guide: Warm house, 70 deg. at night, 80 deg. by day; cattleya house, 65 deg. by night, 75 deg. by day; intermediate house, 60 deg. by night, 70 deg. by day; cool house, 52 deg. by night, 55 to 60 deg. by day. Close down the fires early in morning, and start them quietly again about three o'clock in the afternoon.

SWEET PEAS IN TUBS.—M. T. P., Ulverston: Mix a little bonemeal with the soil, and leave ample room for the application of water and liquid manure, and for one or two top-dressings of rich soil or old flaky manure during the season. Sweet peas in tubs will need more water and more manurial feeding than those in rows or clumps in rich garden soil.

KALANCHOE FLAMMEA. — A. R. E., Pontefract: Take off the tops and insert these as cuttings in sandy soil, over bottom heat. As soon as rooted pot them in a mixture of good loam and finely-broken crocks and coarse sand. Grow the plants in a warm house, near the glass, and give a second potting as soon as necessary. Six weeks or two months of brisk cultivation will produce good stock, and then means must be taken to harden off the plants gradually, so that a greenhouse or pit will accommodate them until cooler weather compels one to bring them into a warm greenhouse. Except when newly-potted Kalanchoes should have abundance of light and sunshine. Quick growth, porous soil, plenty of sunshine, and a good hardening or ripening process are essential for the handsome Kalanchoe flammea.

NAMES OF PLANTS.

N. C., Bideford.—Send when in flower.

A. E. M., Horsham.—1, Cupressus macrocarpa lutea; 2, Myosotidium nobile.

G. L. F., Huntingdon.—1, Odontoglossum Adrianæ; 2, O. crispum, a pretty variety; 3, not recognised.

D. P. S., Warwick.—1, Pyrus betulæfolia; 2, Schizostylis coccinea; 3, Adiantum æthiopicum; 4, Ærides Vandarum.

M. A., Tetbury.—1, Calceolaria amplexicaule; 2, Russellia juncea; 3, Anemone Pulsatilla; 4, Iberis gibraltarica; 5, Hoya carnosa.

F. L. P., Esher.—1, Saxifraga Wallacei; 2, Rubus deliciosus; 3, Exochorda grandiflora; 4, Berberis stenophylla.

S. E. J., Truro.—1, Desfontainea spinosa; 2, Phlox Nelsoni; 3, Spiræa arguta; 4, Ceanothus thyrsiflorus; 5, Trollius europæus; 6, Iris pumila var.

A. M. P., Cinderford.—We do not undertake the naming of florists' varieties of flowers, simply because a large collection of each race of such flowers would be necessary to enable us to make comparisons. In the case of species or well-marked varietal forms, the case is different, and we are always ready to help our readers in naming any such. Roses, chrysanthemums, pelargoniums, etc., should be sent to nurserymen who specialise in these plants, and who, as a rule, will name the specimens at a small fee. In your case No. 1 reminds us of Scipio; Nos. 2 and 4 are probably the same, growing under rather different conditions, and may be Mrs. Agnew; No. 3 is somewhat like Old Port.

CATALOGUES RECEIVED.

WM. PAUL AND SON, WALTHAM CROSS.—An interesting and finely illustrated catalogue of new roses, including a double-page coloured representation of the new tea-scented Hugo Roller.

PAUL AND SON, CHESHUNT, HERTS.—In this catalogue of new roses, etc., prominence is given to the new rambling roses, and several of these are figured.

VILMORIN-ANDRIEUX AND CO., PARIS.—A comprehensive list of chrysanthemums, the varieties arranged in their several sections in true alphabetical order.

BARR AND SONS, COVENT GARDEN.—Dahlias, begonias, cannas, and various bulbous and tuberous-rooted plants are listed in this spring catalogue.

W. H. WILLCOX AND CO., LTD., 23, SOUTHWARK STREET, S.E.—A descriptive and illustrated list of semi-rotary pumps and pump accessories; a useful catalogue.

DOULTON AND CO., LIM., HIGH STREET, LAMBETH, S.E.—A beautifully got up catalogue of terra cotta garden vases, pedestals, and flower pots. The illustrations show elegant and useful designs, and the coloured representations of pedestals and pots for palms, etc., for indoor use, are especially good.

JOHN PEED AND SON, WEST NORWOOD, S.E.—Begonias, gloxinias, and caladiums are chiefly dealt with in this catalogue. Of the latter there are several new varieties offered, and there is a recipe for the prevention and cure of rust on gloxinias.

THOS. S. WARE, LIM., FELTHAM.—Dahlias must shortly be planted, and this list reminds us of the wide selection of fine cactus and other varieties now offered. Tuberous begonias and summer bedding plants are included in the catalogue.

E. H. TAYLOR, WELWYN.—A veritable hive of information with reference to bees, hives, and the various apparatus necessary for successful and profitable apiculture.

Mr. A. Mitchell, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands **1,350 feet above Sea level,** you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

NORWELL'S
PERTH BOOTS

Stand the wear and tear of Gardeners.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

A LADY highly recommends a strong, active, middle-aged Man as HEAD WORKING GARDENER, who has had the entire management of an estate of 70 acres, gardens included; married, family grown up; 20 years' personal character; leaving through death. F. W., Triangle House, Taplow Common, Taplow, Bucks.

A LADY wishes to thoroughly recommend her HEAD WORKING GARDENER, where three or more are kept; life experience in all branches; splendid fruit grower; six years' excellent character; left, as establishment is reduced owing to death; age 39, married; no children at home. Apply to F. TOLLY, Sutton Courtenay, Abingdon, Berks.

GARDENER (Head Working), where two or more are kept; middle-aged; life experience Inside and Out; hard working; good references from last and previous employers. G. BURGESS, 17, Eversleigh Road, Lavender Hill, London, S.W.

GARDENER (Head Working), age 31, married; life experience in good places, including Syon House, Mereworth Castle, and Old Warden Park; 3½ years as Head; highest references. F. FRENCH, Covent Garden, Barming, Kent.

GARDENER (Head Working), life experience with glass, flowers, kitchen garden, and orchids; good character; married. W., 32, Eleanor Road, Bowes Park, N.

GARDENER (Head Working, where two or more are kept); thoroughly experienced in all branches; good refs.; middle-aged; disengaged June 16; wife would assist in house if required. D. S., Ewhurst Place Lodge, Ewhurst, Guildford.

GARDENER (Head Working, where several are kept); life experience in all branches; thorough knowledge of the culture of grapes, melons, peaches, cucumbers, stove and greenhouse plants, flower and kitchen garden; leaving through estate being given up; good references from present and previous employers; age 39, married. H. K., Sidmouth Grange, Earley, Reading.

GARDENER (Head Working, where two or more are kept); 16 years' good practical experience in all branches; thorough knowledge of grapes, melons, cucumbers, stove and greenhouse plants, flower and kitchen garden; age 30; married when suited; good ref; 2½ years in last place. B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head Working), thoroughly experienced in all branches, Inside and Out; early and late forcing; good references; age 38; married; no family. R. GRIFFITHS, Rose Acre, Bearsted, Maidstone.

AS HEAD WORKING GARDENER; well up to all kinds of growing and forcing of flowers, fruit and vegetables, also forestry and general estate work; cricketer. G. W. BELL, The Gardens, Whelprigg, near Kirkby Lonsdale.

SITUATION WANTED. — GARDENER (Head Working or good Second); have had 4 years' experience as Head; thoroughly experienced in all branches; excellent references; age 30; single; abstainer. P. W. K., Office of this Paper.

GARDENER (Head of two or three); life experience Inside and Out; good references from last and previous employers; hard working; middle age, widower. G. BURGESS, 17, Eversleigh Road, Lavender Hill, London, S.W.

A GENTLEMAN can recommend his late GARDENER, aged 37; married, one girl, aged 9; 3 years' character; now disengaged; one or two under him, or good SINGLE-HANDED. Address W. STEVENS, Gardener, 2, Newlands, Salcombe Road, Newbury.

AS GARDENER (Single-handed, or with help), life experience (Inside and Out); can be well recommended from last place; also good previous references; age 44, single. F. GOWERS, Broad Green, Gt. Waltham, Chelmsford, Essex.

GARDENER (Single-handed, or with help); 12 years' experience; good all-round; age 29, married. J. MOONEY, Ellesboro', Butlers Cross, Bucks.

GARDENER (good Single-handed or where help is given); age 35; married, no family; good experience Inside and Out; highly recommended by present employer; good references. J. SAUNDERS, The Lodge, Waratah, Chislehurst, Kent.

GARDENER (Single-handed or with help); life experience Inside and Out; age 35; tall; married, one child; foreman last situation; good references. H. J. W., 17, Salmestone Road, Margate, Kent.

GARDENER, where one or two are kept, or good SINGLE-HANDED; well up in all branches, Land and Stock if desired; excellent testimonials. EDWARDS, 5, St. George's Terrace, Reading.

AS GARDENER (good Single-handed or with help); married; many years' experience, glass, pleasure grounds, herbaceous borders, and good kitchen gardener; good character; age 35. BALE, 12, East Street, Market Harboro.

MARRIED MAN as KITCHEN GARDENER or SINGLE-HANDED; life experience; 7 years in present situation; good references.—S. GEORGE, Woodside Gardens, Maidenhead, Berks.

MANAGER or FOREMAN; 20 years' experience; age 33; single; well up in Roses, Vines, Tomatoes, Cucumbers, Chrysanthemums, Stove Plants, and Forcing; good references. F. BARROWCLIFFE, 23, Church Lane, Lincoln.

FOREMAN (Inside) or SECOND GARDENER; 3 years as such; age 28. Mr. KIRKLAND, The Gardens, Brandon Park, Suffolk, wishes to recommend H. EMMERSON as above; disengaged; Bothy preferred. Address, Great Bealings, near Woodbridge, Suffolk.

FOREMAN (Inside), or good SECOND.—Mr. A. HENDERSON, Mabledon Park Gardens, Tonbridge, wishes to highly recommend his late Foreman to any Lady or Gentleman requiring a highly respectable and trustworthy man; life experience; age 27; married, no family; abstainer. Apply G. KEMP, South Street, Chailey, Lewes, Sussex.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Dahlias in the Garden.

One of the most interesting points in gardening, as in other matters that are greatly influenced by fashion, is the manner in which history repeats itself; and another point hardly less remarkable is the difficulty which those immediately concerned with one class of flowers have in taking advantage of the lessons that other classes are so well able to afford. It would be possible to mention several plants that have been so changed as to be hardly recognisable as the result of the labours of those who have given them special attention, but have failed to maintain a firm hold upon the flower-loving community owing to a misapprehension of the primary object of flower culture. The cultivator who has achieved any considerable degree of success with some particular group of plants has very naturally a desire that others should have an opportunity of seeing the results of his skill, and in many instances contributes them to prominent horticultural exhibitions. The raiser is, perhaps, even more desirous of submitting his novelties to public notice, and very properly takes advantage of his opportunities for so doing. In each case a public service of considerable value is rendered, for well-grown specimens serve as object-lessons, and the exhibition of novelties helps to keep cultivators fully informed as to the advances that are being made. Unfortunately in some instances the fact is not so fully recognised as should be the case, that the primary object of flower culture is the beautifying of gardens and glasshouses, and the provision of cut flowers for the adornment of the home. As a consequence thereof the exhibition side of plant improvement has a greater influence upon raisers than should be the case. We are reminded of this by the immense numbers of dahlias that are now being bedded out, and by the fact that the largest proportion of the varieties belong to the cactus section. In the creation of new forms of these raisers have shown much activity, and they have been able to introduce varieties that are remarkable for the diversity in the form and colour of their blooms. Had cactus dahlias no other purpose than to provide boxes and vases of blooms for autumn exhibitions, we should be justified in bestowing unqualified praise upon the accomplishments of the raisers, for judged from the exhibition standpoint they have been of a very high order. It must, however, be remembered that of the thousands who plant cactus dahlias annually a very small proportion exhibit, and that others grow them wholly for garden embellishment. For this latter purpose cactus dahlias do not as a whole reach a very high standard. In many instances they are too robust in growth, and bear their flowers on stalks too short to admit of their carrying them above the foliage. The majority of the varieties are free in blooming, but it is not of much avail that large numbers of blooms be produced if they are hidden by too ample leafage. We mention this with the hope that raisers will recognise the fact that a race of cactus dahlias specially suitable for the production of striking colour effects in the garden is much needed, and that they will devote more of their time and attention to the habit of the plants than they have yet done. While raisers may with considerable advantage change somewhat in their method of procedure, there is plenty of room for improvement in the making of selections by the general body of cultivators. The majority plant almost exclusively cactus varieties for garden decoration, and this is done by not a few under the supposition that because the blooms are less formal than are those of the show varieties they are best adapted for the garden. As a matter of fact the latter when grown in deeply dug soil with but little, if any, manure, will produce a much finer colour display, for the blooms will be produced in large numbers, and will be borne on stalks of sufficient length and rigidity to carry them well above the foliage. On the other hand, if they are grown in heavily manured soil, as is so frequently recommended, they will be hardly less luxuriant than the strong growing cactus varieties, and the stalks will not be strong enough to hold the flowers erect. We mention this because many amateurs base their estimate of the show and fancy varieties on the liberally fed plants that may be seen in gardens and nurseries where these two sections are grown for the production of exhibition blooms. More attention should be given to the pompons, which are free in blooming, and the flowers are borne on long, rigid stalks, and admirably adapted to indoor arrangements. The pæony-flowered varieties have much to recommend them for large beds and spacious borders, but they should not be grown in a very rich soil because of their tendency to make a strong growth. Much may be said in favour of all the sections, but in effective-

ness of colour and elegance of form not one is equal to the cactus, and for that reason we are extremely anxious an endeavour should be made to improve their habit of growth and thereby increase their usefulness.

Mr. James Whytock, head gardener to the Duke of Buccleuch, at Dalkeith Park, Dalkeith, occupies a foremost position among British gardeners, and is well-known on both sides of the Tweed and also in the Sister Isle. It gives us great pleasure to give Mr. Whytock's portrait, especially as he is now president of the Scottish Horticultural Association, as well as an active and prominent member of the Royal Caledonian Horticultural Society. Born at Tullyallon Castle Gardens, Kincardine, Mr. Whytock took his first lessons in gardening from his father, and subsequently served his apprenticeship with Mr. Anderson, at Oxenford Castle. From Oxenford he went as journeyman under the late Mr. Thomson, at Dalkeith Park, and eventually became foreman there under the late Mr. Malcolm Dunn. From Scotland Mr. Whytock crossed over to Ireland, where he was head gardener to the late Count de Vesci at Abbeyleix, Queen's Co., and subsequently head gardener to Earl Fitzwilliam at Coollattin. At Coollattin Mr. Whytock was particularly successful, and became famous as an exhibitor. After the death of Mr. Dunn, Mr. Whytock returned to Dalkeith Park, and he has done much to enhance the horticultural fame of these fine old gardens during the eight years he has had entire charge of them. Of gentlemanly bearing, kindly disposition, and quiet manner, Mr. Whytock has many friends throughout the United Kingdom, and we trust he will long be spared to hold his present position and increase those friendships.

Damage to Trees in Bushey Park.—For a few moments, just before 10 p.m. on Monday, June 1, the wind blew furiously in the south-western district of London, then hail fell for a few moments, followed by a heavy downpour of rain, that continued at intervals and varied in intensity well on into the night. The storm was preceded by very vivid sheet lightning that lit up the heavens for miles round. The damage, and it was considerable in some few places, appears to have been all done during the few minutes before the rain fell. So tremendous was the force of the wind that about thirty of the big lime trees that form a background to the southern side of the fine old Chestnut Avenue in Bushey Park, were overturned with their heads to the north by west. Very few, probably only three of the chestnuts, were uprooted, but one other was smashed almost to pieces by the fall of a big lime tree. The damage was bad enough, but it is regrettable that some of our daily contemporaries should have so exaggerated the disaster, one paper stating that over four hundred trees were blown down. So far as we could gather about fifty trees suffered, and some of these were quite small ones. The damage to the avenue is confined—with the exception of a very few small broken branches—to the Teddington end, and all on the south side. The roof of the lodge was smashed in by the falling trees, but, fortunately, no one was hurt. For long years to come there will be a bad gap at the Teddington end of the avenue, in the comparatively narrow track of the most vicious portion of the storm, but we are glad to know that the Chestnut Avenue as a whole will lose little, very little of its beauty. Many of our readers are aware that behind the chestnuts, on each side of the avenue, there are three rows of giant trees, chiefly limes, and these have more than once sheltered the fine chestnuts. One of the curious features of the damage is that where the wreck is greatest there stands one lime tree, unharmed save for a few small branches torn from it by its falling neighbours.

Gardeners' Royal Benevolent Institution.—Lord Aldenham, who presides at the festival dinner of this invaluable charity, has issued a strong appeal for support in his endeavour to aid the institution. He states that he is most anxious to raise a sufficient sum to meet the deficiency in the ordinary income required to discharge the annual liabilities, which amount to £2,500, and we need hardly say that we earnestly hope he may accomplish the object he has in view. Lord Aldenham expresses the hope that all who sympathise with the object of the charity will, if they are not able to be present at the dinner, give practical expression thereto by contributing to his list of subscriptions.

National Rose Society.—The arrangements for the current year form, with the list of members, schedules of prizes, and bye-laws and regulations, a rather substantial volume. The long list of members is of interest, as showing the remarkable popularity the society is enjoying as the result of the vigorous policy initiated a few years since. The society, as already announced, will hold three exhibitions this season, the first in the gardens of the Royal Botanic Society, Regent's Park, the second at Manchester, and the third, which will be the autumn show, at the Horticultural Hall, Vincent Square. Several new classes have been added to the schedule of the Regent's Park show, and the more noteworthy of these are the three for representative groups of the roses that came out first, second, and third respectively in the ballot for the Nickerson Cups. In each class liberal cash prizes are offered. The inclusion in the schedule of the "plan showing position of the Royal Botanic Gardens," is extremely unfortunate, inasmuch as it suggests that the only railway anywhere near Regent's Park is the tube between Waterloo and Baker Street. There is, of course, the Metropolitan, which connects the termini of the Great Eastern, the Great Northern, the Midland, the London and North-Western, and the Great Western Railways with Regent's Park, and this should certainly have been shown. There is also the London Central, which connects with the Bakerloo Tube at Oxford Street, and both these should be shown on the plan.

Rhododendron Show at Regent's Park.—In accordance with their usual practice, Messrs John Waterer and Sons, Lim., of Bagshot, Surrey, are holding an exhibition of rhododendrons in the gardens of the Royal Botanic Society, Regent's Park. The display will be again a very large, and it promises to be a most beautiful one. The exhibition opens on Wednesday, June 10, and continues throughout the month.

Belgian Honours for Horticulturists.—Among honours and decorations recently accorded to continental horticulturists of note, we find that the order of Officer of the Order of Leopold has been awarded to Mr. Arthur de Smet, one of the best-known of Belgian horticulturists; and Mr. Romain de Smet, the president of the Circle van Houtte; and the order of Chevalier of the Order of Leopold has been conferred upon M. Firmin Lambeau, of Brussels; Mr. Chas. Vuylsteke, of Loochristy, the famous orchid raiser; and Mr. Louis Hartman, treasurer of the Royal Linnean Society of Belgium. Our young friend, Mr. Leon Pynaert, director of the Congo State Botanic Garden at Eala, has been appointed Chevalier of the Order of the Lion of the Congo.

Forestry in Ireland.—The Departmental Committee appointed for the purpose of considering the possibility of improving the present position of forestry in Ireland have now made their report, in which they deal with existing conditions, and recommend the adoption of a national scheme of afforestation. It is distinctly stated that, in the opinion of the committee, a comprehensive scheme of forestry, whether undertaken through local authorities, private owners, or directly through a Forestry Department, can only be carried out by or under the direction of the State. An exceptional opportunity for acquiring land suitable for forestry, and not so suitable for any other use now, the committee consider, presents itself in Ireland, in connection with the Land Purchase Acts; and such a scheme, including the preservation and extension of existing woods, and the creation of a new forest area, would be, the committee consider, a sound investment for the nation. As a result of certain surveys it is estimated that there is available a total possible forest area of at last 1,000,000 acres, made up in round numbers of 300,000 acres of existing woodlands; 200,000 acres of plantable land in large blocks; and 500,000 acres of plantable land in smaller blocks. Legislation is not necessary for the establishment of a forestry authority, as the Department of Agriculture is endowed with the necessary legal powers for the improvement and development of woodland, but funds will be required in the event of the proposed scheme being adopted. It is suggested that the scheme should provide for the acquisition of 200,000 acres of land in large blocks to be planted, managed and maintained in the interest of the country as State forest.

Prizes for Hyacinths.—The President and Council of the Royal Horticultural Society have accepted the offer of the Dutch Bulb Growers' Society at Haarlem of prizes for forced hyacinths, to be competed for at the R.H.S. exhibition to be held on March 9, 1909. The prizes are as follows: Division I., for amateurs and gentlemen's gardeners.—Eighteen hyacinths: 1st prize, £6 6s.; 2nd prize, £5 5s.; 3rd prize, £4 4s.; 4th prize, £3 3s.; 5th prize, £2 2s.; 6th prize, £1 1s. Twelve hyacinths: 1st prize, £5 5s.; 2nd prize, £4 4s.; 3rd prize, £3 3s.; 4th prize, £2 2s.; 5th prize, £1 1s. Four pans containing hyacinths (ten roots in one pan), the blooms of each pan to be of distinctly different colour: 1st prize, £4 4s.; 2nd prize, £3 3s.; 3rd prize, £2 2s.; 4th prize, £1 1s. Division II., for nurserymen.—The finest collection of hyacinths, either in pots or pans, or in glasses: prize, the gold medal of the Dutch Bulb Growers' Society at Haarlem. The regulations are that in the first two classes each bulb must be in a separate pot (size optional). In the three first classes all must be single flowers; no flowers may be tied together. An exhibit must not contain more than one specimen of any one variety. Exhibitors may show in not more than one class, except in the following: Competitors may enter the classes for twelve hyacinths and four pans or for eighteen hyacinths and four pans or singly in either one. In all the classes the bulbs shown must have been forced entirely in Great Britain or Ireland.

Successional Flowers in the Grass.—The facility with which a successional display of spring flowers may be had over a considerable period, has been admirably demonstrated on the Cumberland Mound, in the Royal Gardens, Kew, this season. For some years past it has been the practice to have two distinct displays of spring flowers on the mound, but this season there has been three. The first to yield of its large double yellow flowers was the bold growing Narcissus telemonius fl.-pl., and when the beauty of its flowers was passing, the buds of the Emperor and several other varieties were well advanced. These in due course attained full development, and produced an exceedingly rich display of colour. In their turn these were followed by the flowers of N. poeticus recurvus, the latest of the several forms of this species, and the bluebell in mixture. The brown withered flowers of the Emperor and its associates are rather more prominent than one could wish. but they are by no means sufficiently prominent to spoil the general effect, and, in fact, when the display is seen from a short distance they are not noticeable. This narciss and bluebells are used with excellent effect in an enclosure on the south side of the North Gallery, and as the enclosure is beyond the range of the waterfowl, the pure white and blue flowers springing from the bright green carpet of grass present a delightful appearance.

Ups and Downs of Sheffield Chrysanthemums. — At a recent monthly meeting of the Sheffield Society Mr. J. E. Newsham, the treasurer, briefly discussed its history. He showed that the society was begun in 1885, and the first exhibition was held in the Corn Exchange on November 20 and 21 of that year, and the exhibitions had continued to increase in size ever since. In 1893 the society had a financial set back and closed the year with a balance of nine shillings only. The most successful year was 1900, when a substantial balance accrued, chiefly as a consequence of the large attendance at the show, the door receipts totalling about £243.

Canadian Rock Maple for Mangle Rollers.—In his account of various timbers seen during a recent visit to the Liverpool docks, Mr. J. M. Hillier, curator of the Museums at Kew, observes that large consignments of Canadian Rock maple (Acer saccharinum) were coming in for the manufacture of mangle rollers. For this application the wood is imported shaped octagonally, and is immediately stored in the dark and packed in sawdust until required for conversion. This is done to prevent checking (surface cracks). These rollers are made chiefly at Keighley and Accrington, and one firm alone will produce as many as 300,000 rollers during the course of a year.

Compulsory Spraying. — In every State and in every farming community there is always one man at least who is behind the times, who neglects his trees and lets insect pests and fungus diseases run riot. His neighbours are progressive, up-to-date orchard men or nurserymen. They cultivate the ground, feed the trees and spray for insect pests and fungus diseases. The trees of the easy going farmer are infested with almost every kind of disease, yet he won't cultivate, he refuses to spray, and he won't cut his trees down. All that he will do is to grumble when his neighbours remonstrate with him. Now, in Oregon, says the "National Nurseryman," if a man fails to spray for San José scale, the authorities do it for him and tax him for the work. This is as it should be.

ARUM LILIES.

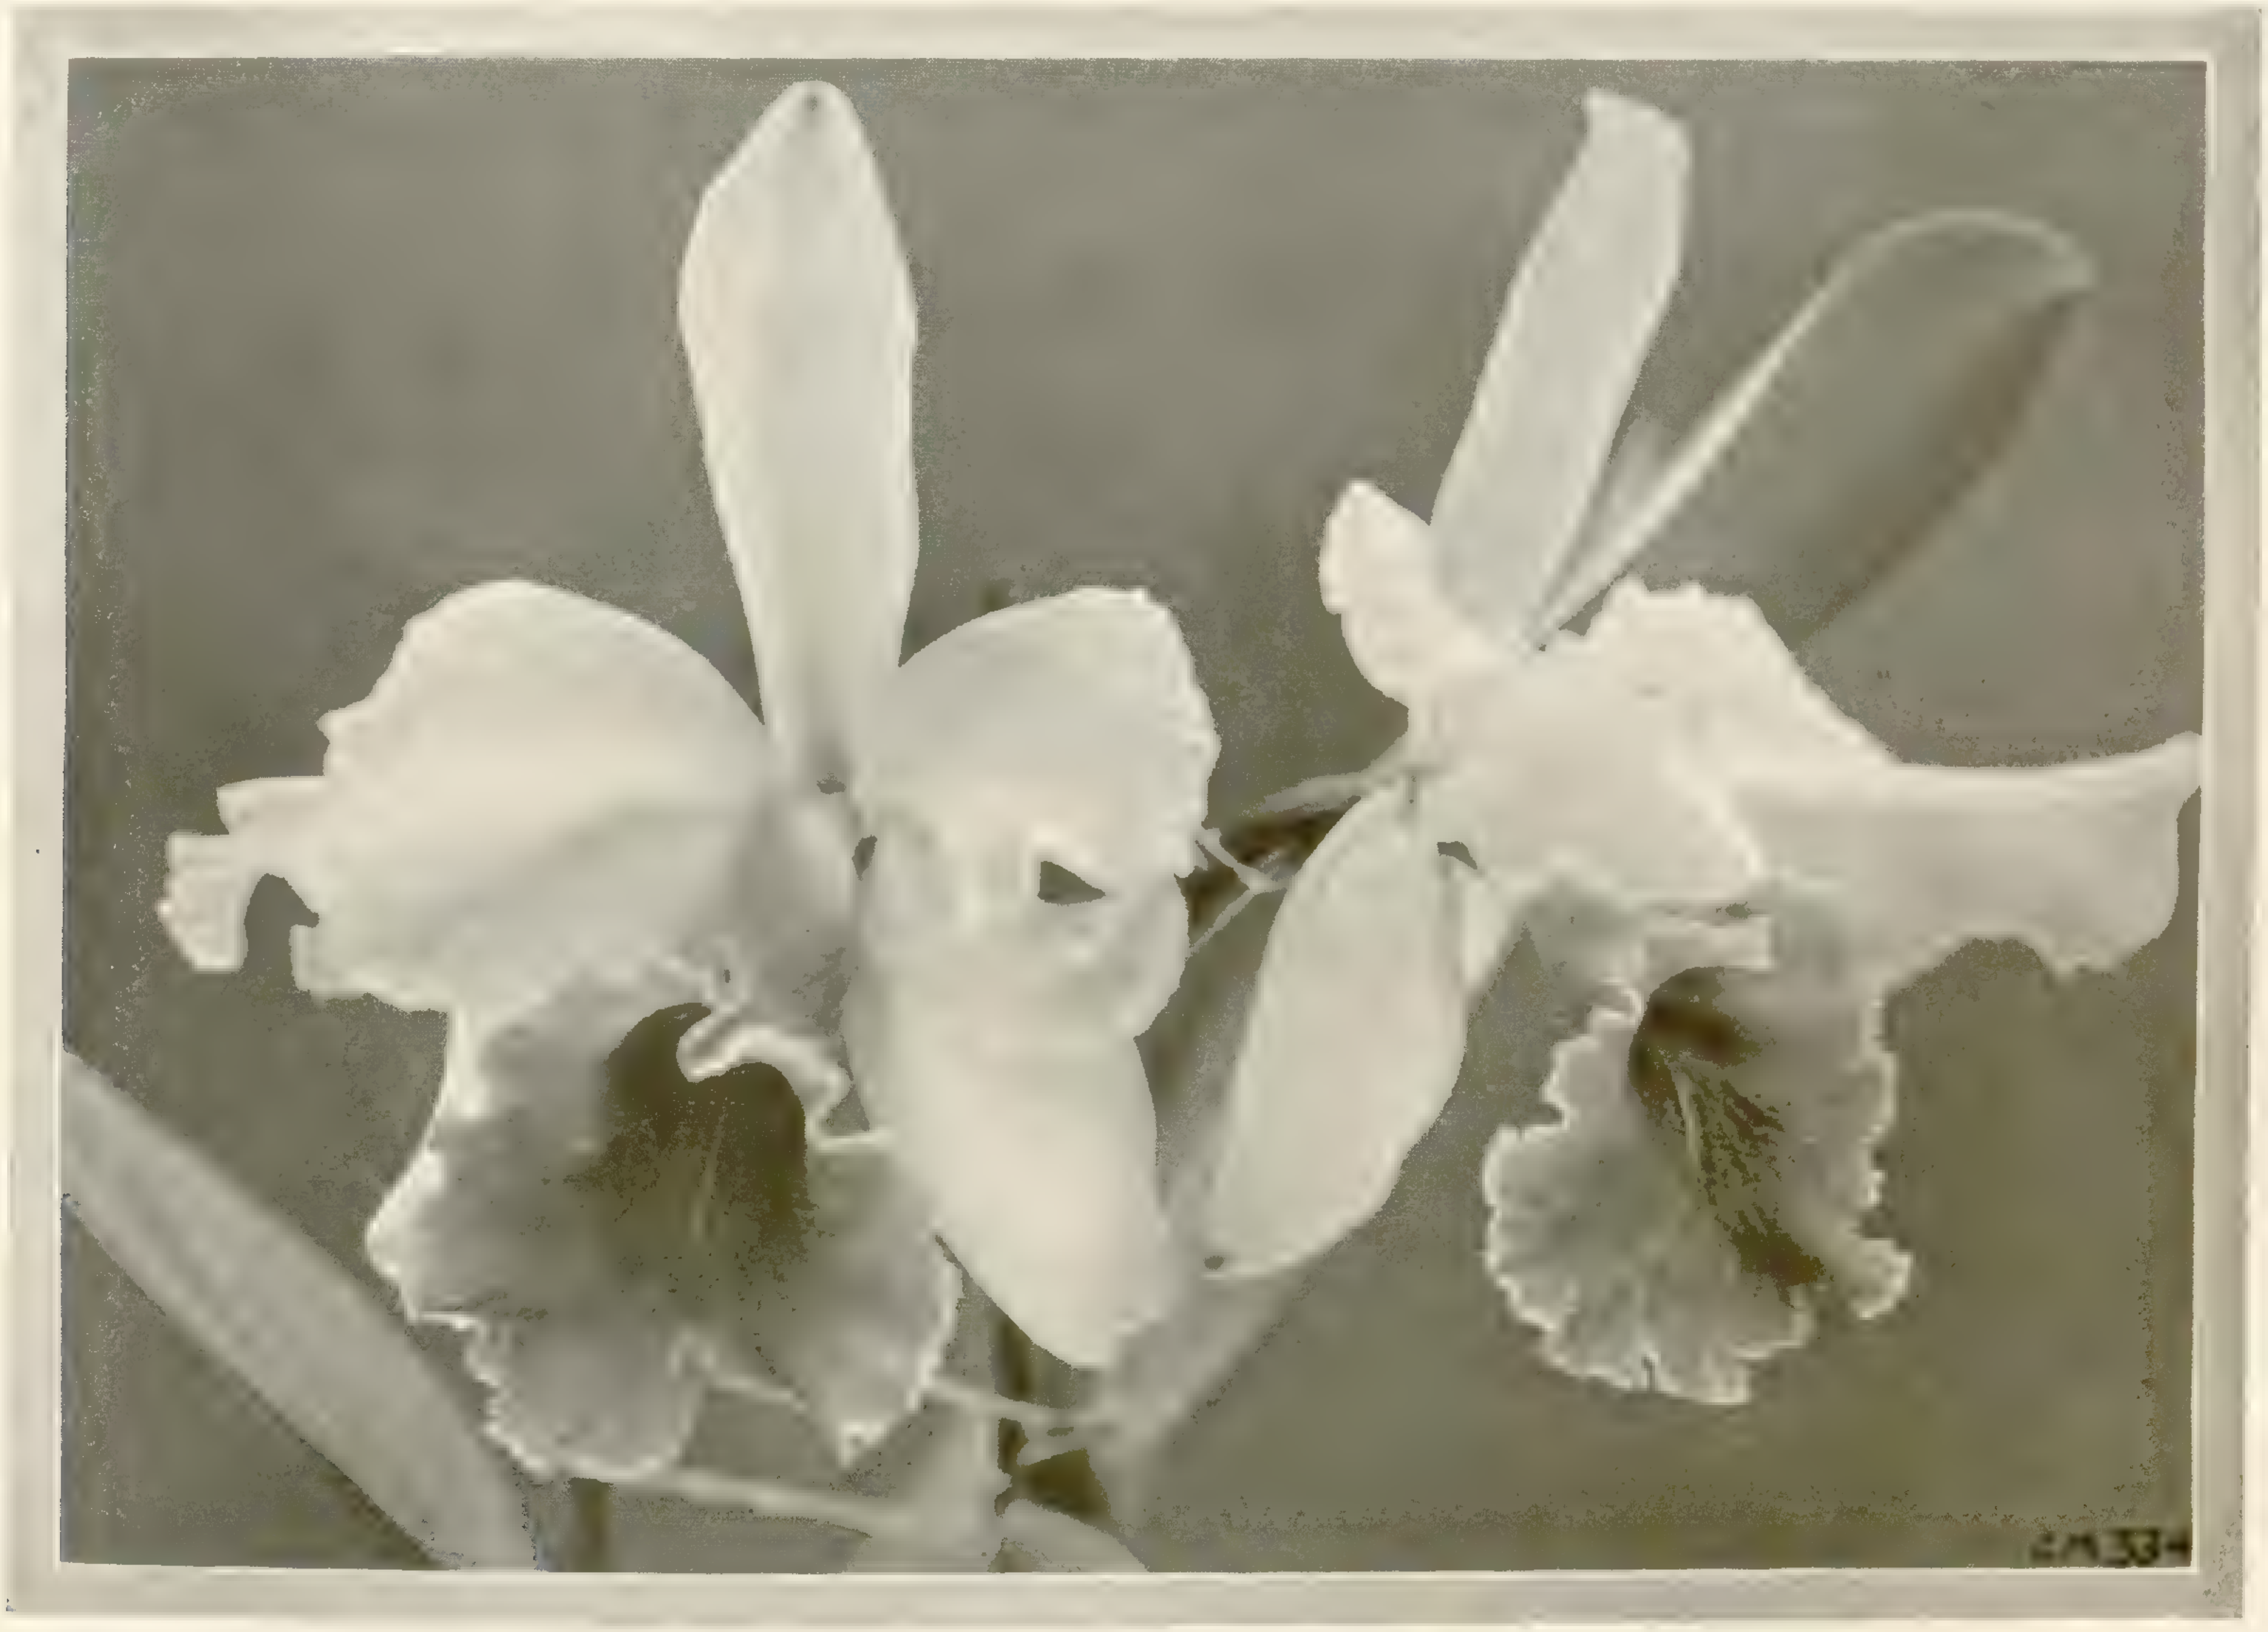
Within the last few years great strides have been made with the arum lilies or richardias, so that to-day we possess a number of fine forms that are extremely valuable for all decorative purposes. With the species Richardia africana, or, to give it the older designation, Calla ethiopica, every gardener is well acquainted, and when one realises that it is grown by the thousands to supply the flower markets, it will be apparent that the best of the varietal forms and the newer species are deserving of close attention.

One notes that the spathes of the arums almost always maintain a good regular market price, and there is every prospect that they will continue to do so. For wreaths and floral decorations in general they are almost indispensable, and help the floral artist to maintain a high-class tone in his productions.

Another notable phase is the culture of the type as a hardy aquatic, and where it succeeds (as it does in the more favoured districts) there is nothing which imparts a more tropical appearance to the waterside, or makes a more charming frame to a pretty water picture. By all means, let us advocate a still more extended use for these moisture-loving subjects, as there are doubtless many sheltered pieces of water in the southern counties where the richardia would thrive and luxuriate. The main thing is to plant the crowns deep enough to escape the frosts of winter, and if this is assured, the success of the plants should be a certainty.

Varieties of R. africana.

The varied forms of the white arum need something more than a superficial glance, many of them being sterling improvements on the type. Grandiflora, a selected, typi-



LÆLIO-CATTLEYA ELVA WESTONBIRT VARIETY.

Flowers purple, yellow, and gold. F.C.C., R.H.S., May 26. Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

cally giant form, is strong in growth, with massive spathes, but it is not free: consequently not of much value for the supply of cut spathes. Perle von Stuttgart is better; it is of moderate size, but its pearly whiteness and dwarfish habit make it a useful acquisition. The Godfrey is a fine form, and carries a good number of spathes which are unsurpassed for purity. Devoniensis is a dwarfish, compact plant, which is very free in flowering and excellent for pots. For a large conservatory, where imposing subjects are required for a background, the gigantic Nicolai, enormous alike in the spathe and foliage will be found most useful. A large-flowered, dwarf variety is Ladhami, raised by Mr. B. Ladhams, of Southampton. This is very free, and the spathes are broad and flat, and valuable for wreaths. Little Gem has not quite realised the expectations to which its introduction gave rise some years ago; true, it is dwarf and dainty in appearance, but it is not free enough to warrant anyone growing it on a large scale.

The Yellow Arums.

What are generally known as the "yellow arums" are usually represented in gardens by R. Elliottiana, which has golden yellow spathes and silvery spotted foliage. This is undoubtedly the best known, and it is gradually becoming popular for floral decorations, and here and there firms are working up large stocks in preparation for supplying the flower markets. For high-class decorations the yellow arums will provide a touch of refined colouring which will heighten the tone and improve the appearance of floral designs, and there is every reason to believe that good prices will attend the sales of these golden spathes. The form of R. Elliottiana, known as Rossi, is reputedly more free in flowering than the type.

The green-foliaged R. Pentlandi provides a charming shade of yellow, but is not so plentiful as Elliottiana, but we may see much of it in the near future, as it is finding its way into many gardens. The soft greenish-yellow Aurata, sometimes known as hastata, has a dwarf habit, and forms an interesting species for the conservatory.

Pink and Reddish Shades.

It is extremely probable that the charming rose-pink R. Rehmanni will, like the yellow arums, rapidly come to the front for the production of spathes for decorative purposes in a cut state. The pink spathes will be a boon to the florist, and anyone who has experienced the charming contrast to white flowers afforded by Crinum Powelli when used in floral designs will more than welcome Rehmanni for the self-same purpose. Compared with Rehmanni, the arums with reddish spathes are hardly worth growing, though doubtless they will some day be turned to account by the hybridists. P. S. Hayward.

Climbers.—Maintain a close watch on all growing climbers and prevent the growths from becoming unduly crowded, entangled, or passing behind supports. Tie all in their proper positions, though for anything approaching its flowering period it is best to allow the flowers to hang a little loosely. The well-known Clematis montana will now be assuming its most beautiful condition, and this and all similar plants must be allowed to ramble as naturally as possible. Attend to the staking of carnations and herbaceous plants. — E. F. Hazelton, Knowsley Gardens, Prescot.

A WEALTH OF GARDEN COLOUR.

"Bubbles we buy with a whole soul's tasking:
'Tis heaven alone that is given away,
'Tis only God may be had for the asking,
No price is set on the lavish summer:
June may be had by the poorest comer."

What is the moral of the poet's lines? Surely that every man should find his happiness out of doors in the season of soft winds and sunshine? The floriculturist, be he wealthy or poor, can add to the glory of June, and create beautiful scenery, to some extent, just outside his door; his whole life, and the lives of those who dwell under his roof, will be raised and sweetened, characters will be softened, hearts lightened, in proportion to the loveliness that is born at his bidding.

There are scientists nowadays who try to decide upon the physical influences of the different colours, doctors who experiment with the curative powers of hues, spiritual students who believe that souls are helped by pure tints in garb and home furniture; shall the man be called too great an idealist then, who feels that the colour masses he arranges in his garden are capable of altering the sensations, age, and even the sentiments of those who bask daily in their beauty?

"I believe," wrote a German author, "that colour is a force of which we are strangely doubtful; a blaze of sunshine on a whitewashed wall may teach a child more reverence than could be instilled into his breast by tedious book-lessons." For the joyfulness of gorgeous hues we are all ready to sing praise. So it is in our gardens that we should show forth the faith that is in ourselves; a pallid, neutral tinted flower bed or two may well serve to show up the vividness of others, but the whole appearance of the pleasure grounds, when a bird's-eye view can be taken of them, should be that of a wealth of colour.

In spring we prepare our triumphs, in the bedding-out months we produce them; the summer and autumn are spent in enjoying them, and winter, though it robs us, should find our memories so stored with exquisite harmonies that we are cheered still, and find new joy in looking forward to greater glories in another year.

"June may be had by the poorest
comer."

Yes, the cottager who can only afford to spend pennies may stock his garden with flowers that a prince might envy; there is, perhaps, no vermilion, orange, or amber to excel those provided by the homely nasturtium and Iceland and Tulip poppies, no carmine richer than that of candytuft, sweet peas, and godetias, no lovelier pinks than are shown by Shirley poppies, sweet peas, and Lavatera trimestris rosea.

In gardens, large or small, colours are wasted when dotted about in scanty portions, or mingled until their characteristic values are minimised. A bed of orange calendulas may be, for instance, a perfect feast for any eye, but these marigolds when sown from mixed seed, have a much subdued effect, cream, apricot, and lemon being also present. I consider that this "common" flower, especially in its deepest tint, is fit for any garden; place masses of it in front of crimson or brown-foliaged shrubs, or in the close neighbourhood of young copper beeches, and no artist could pass the spot by without feelings of gratitude.

What a comforting sight is a mass of scarlet! One small bed well filled with pelargoniums cultivated for flower and foliage can be a delight, so what may not be claimed for a long border given up to scarlet flowers of all kinds, against a southern white wall? The stately herbaceous lobelias, the cannas, dahlias, and lychnis alone will serve to banish much sadness from the neighbourhood; and are there no poppies, ranunculuses, zinnias, verbenas, begonias, Phlox Drummondi, tritomas, geums, carnations, as well as antirrhinums, zonal pelargoniums, and tropæolums?

Why, too, should blue be so ill-used a colour? We hedge it round with cold white, or give it the crude accompaniment of vermilion, when it ought to be left to itself, every plant being encouraged to give its best possible yield of blossom, and a variety of plants congregated together to keep the display as lasting as possible, and also as well diversified in height as may be.

Perhaps the most satisfactory of all methods of bed and border filling to show off colour is the pyramidal style; from the dwarfest of dwarfs at the edge there should rise a bank all of the same shade, until the blossoms of the tallest plant form the background. This is exceedingly easy to carry out in rose-pink; a Phlox Drummondi may cover the earth at the edge with the hue, saponaria will repeat it, so too will asters that begin with Liliputs and end in Giants; then pelargoniums, perennial phloxes, hollyhocks can carry it onwards and upwards.

No artist would paint a picture in which little points of many brilliant colours were dotted over the whole canvas; then I claim that the garden landscape should not either be so treated. The more we can learn to regard our lawns and other chief open spaces as pictures, to be built up with loving carefulness, aiming at harmonious wholes, the sooner will gardening be more recognised as art rather than as a series of isolated attempts at showing off varieties of florists' flowers, or the intricacy and elaborateness of the patterns that cramped and confined blossoms and leaves can make!

There are cold-looking gardens by the thousand in England that need only one rich-hued immense bed or border to redeem their sad appearance; the front grounds of moderate-sized houses are especially dreary as a rule, decorously shrubbed and enclosed, but showing none of the floral grandeur that the sowing of a packet of giant sunflower seed even could effect! It seems as though country-dwellers feared to be "vulgar" in displaying a love for reds and yellows; perhaps this is a state of opinion caused by the crude bedding out of red, rose, blue, and gold, which disfigured gardens generally a few years ago. Maybe the garishness of the modern builder's bricks and mortar has partly been to blame.

The brilliance that should lie outspread beneath summer sunshine may be produced by plants as rare and costly as the wealthy garden-owner may desire, while the humble cot can have set just as effective, though cheap, a carpet over the restricted area of its hired land; it is the colour sense alone that will create the beauty, and the grateful heart, most open to the influence of all things fair, will best enjoy it. My suggestion is merely this, that this year we should each endeavour not only to grow the best varieties of flowers in masterly manner, but also to display them at their greatest value, and this is only done by letting red prove what red can be, and blue its depth, and rose its warmth, and white its dazzling purity, when laid with a broad brush boldly upon the garden canvas. M. H.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

GREENHOUSE SUCCULENTS.

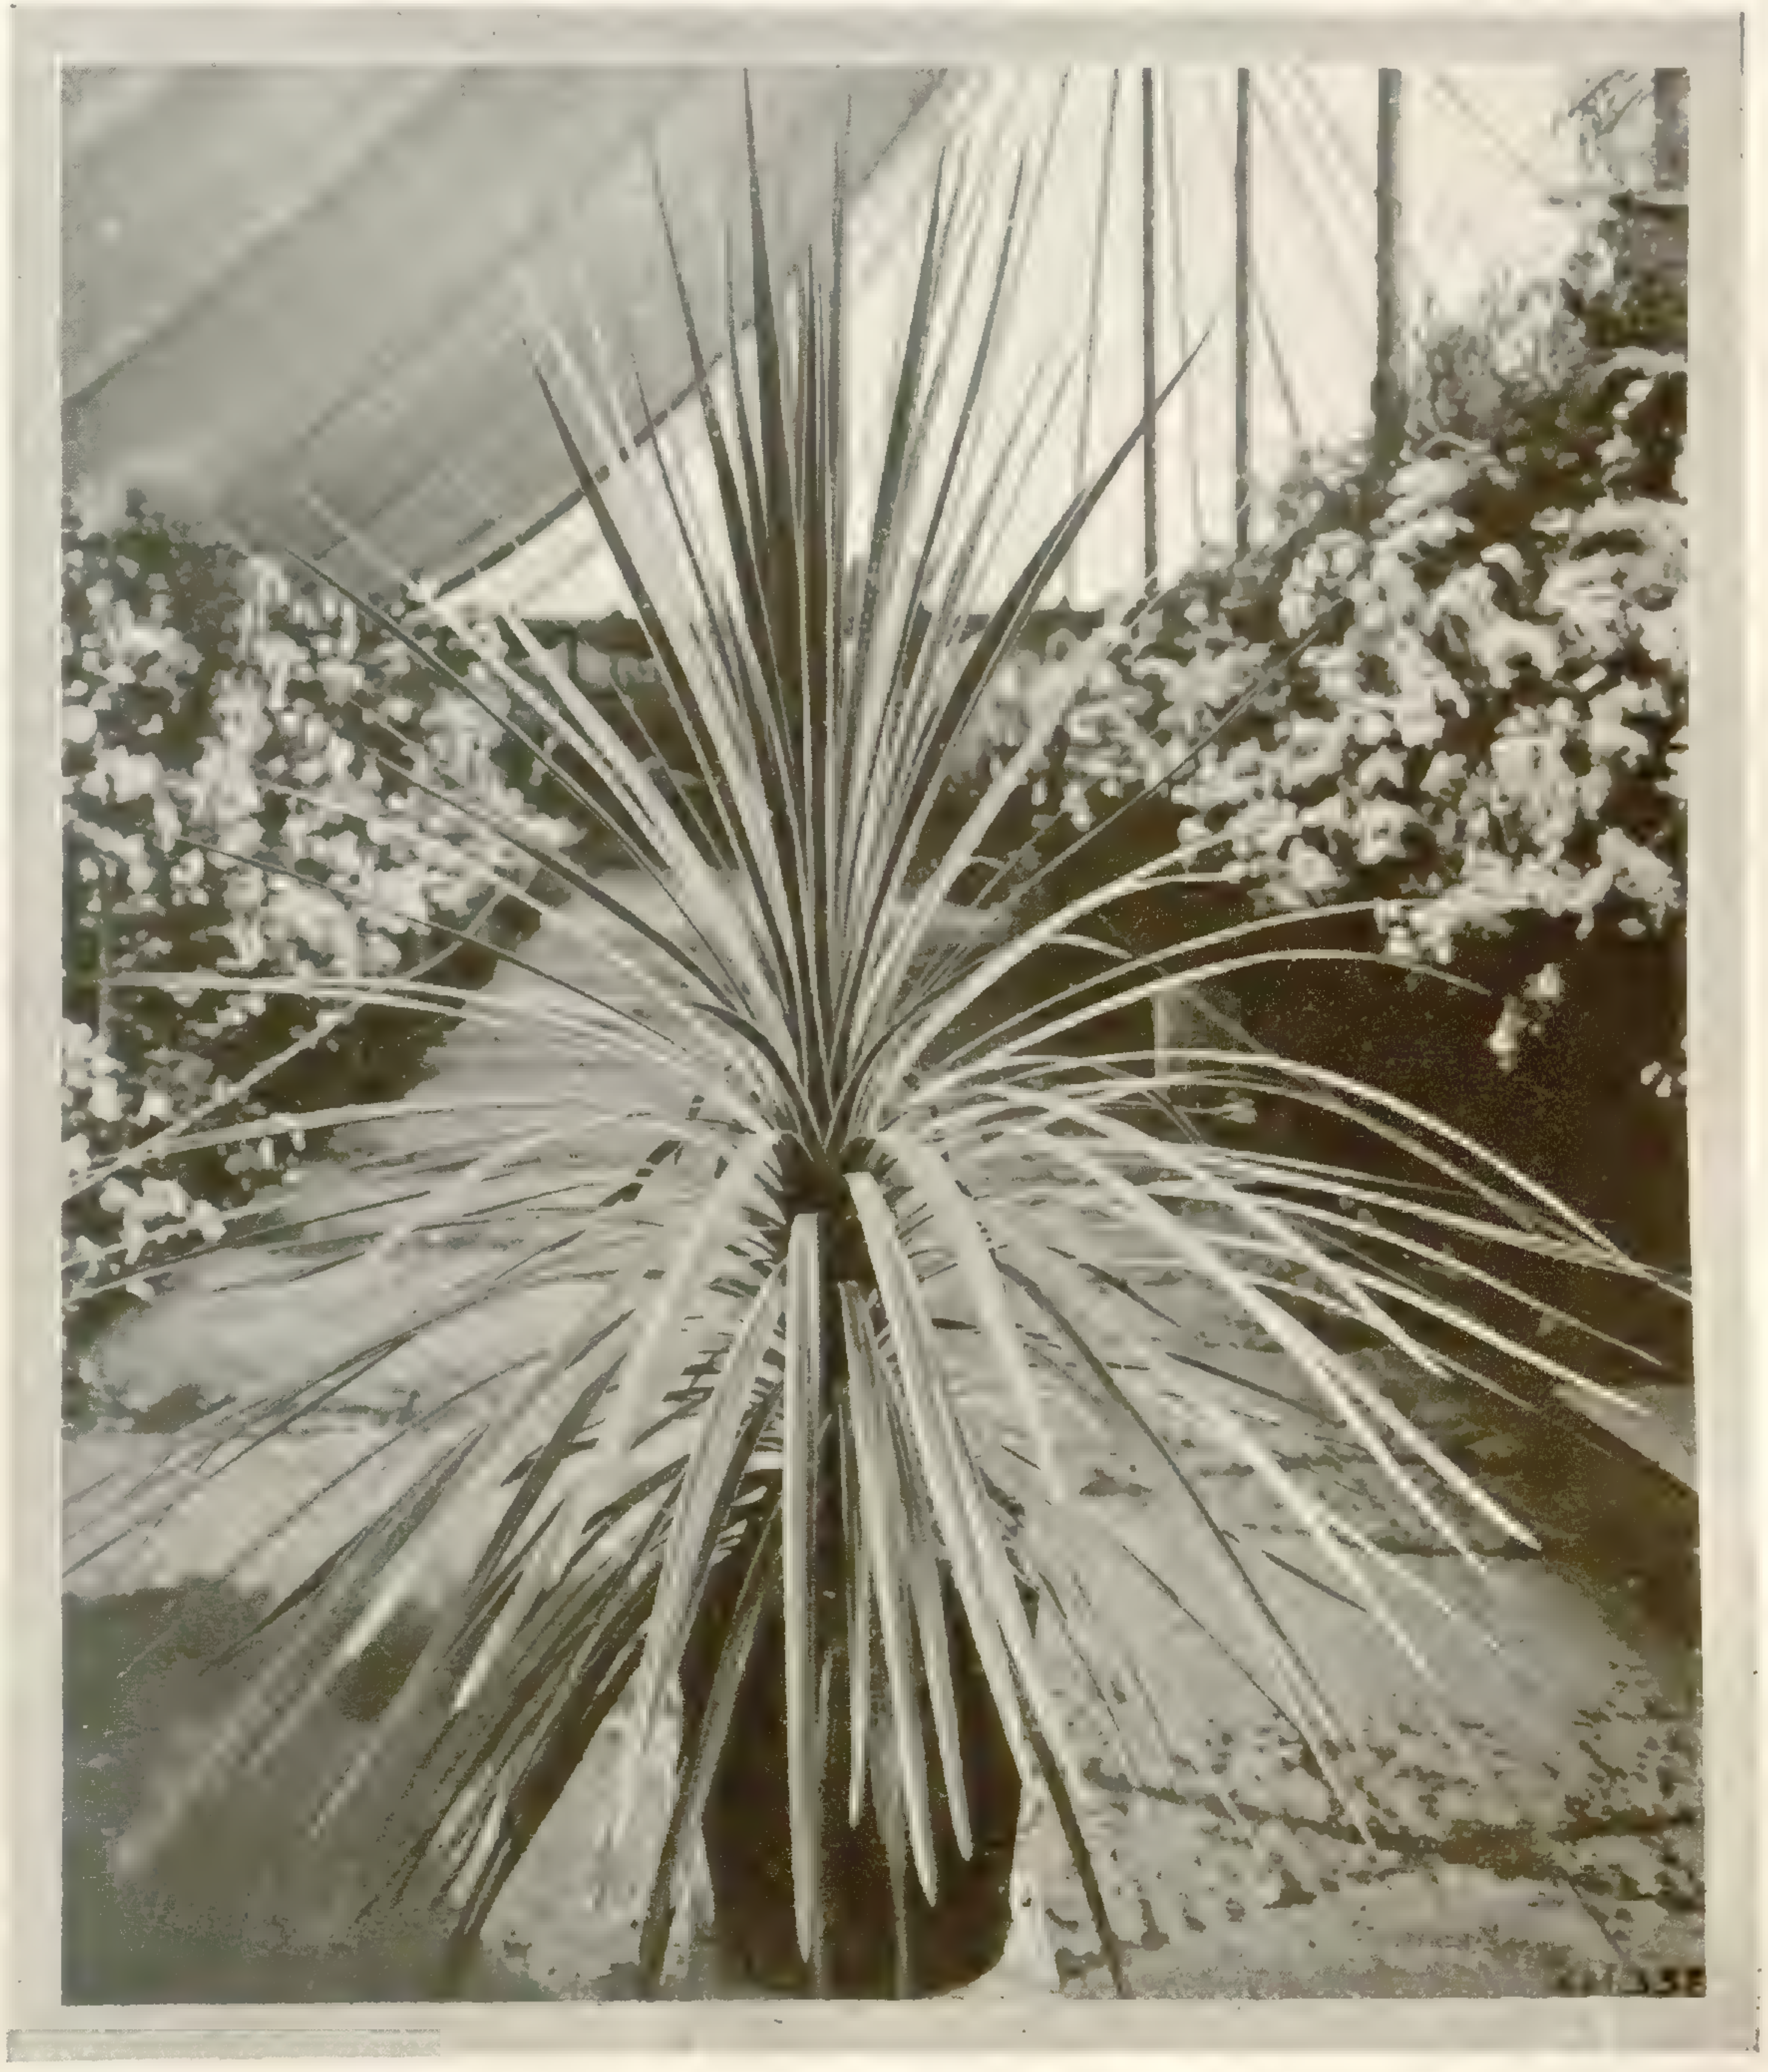
There are not many among this class of plants that can be recommended either for the production of cut flowers or for indoor decorations. Though in themselves the flowers of many are most beautiful, they either do not remain sufficiently long in bloom to render them of any value for cutting, or their stems are too short to admit of their being set up to advantage when placed in water. There are, however, a few that are most useful, and among them we may include the crassulas, kalosanthes, and rocheas, all closely allied to each other. At one time the old Crassula coccinea, as it was then called, was a great favourite with exhibitors, and was found in all good collections of flowering stove and greenhouse plants, and huge specimens from three to four feet in diameter, covered with fine trusses of bloom were frequently met with at our leading shows. Now, however, plants with two or three trusses on are more general, these being of greater service to the present generation of gardeners.

Grown in 48-sized pots these may be used with advantage in a variety of ways, either as dot plants in the flower beds, for grouping in the conservatory, or as single specimens for vases in the dwelling-rooms. Though some of the kinds may be readily grown from seed others are best propagated by cuttings, selecting the tips of the young growths for this purpose. Rochea falcata and some others produce seeds freely, and if these are sown either as soon as ripe, or early in spring, in shallow, well-drained pans, and placed in gentle heat, the young plants are not long in making their appearance. Being very succulent they are liable to damp off unless kept in a rather dry atmosphere.

The seedlings should be pricked off as soon as large enough to handle, into light porous soil, and when they have made four or five leaves they should be put singly into small pots, and afterwards placed on a shelf in the full sunlight to induce them to grow as sturdily as possible. During the hot weather they will need to be liberally supplied with water, but as cold weather approaches very little will suffice, especially during the dull winter days.

R. falcata may also be propagated by cuttings, and where a good stock of old plants is at hand this is the most easy way of keeping up a supply of young plants. Cuttings should be inserted in August, either singly in small pots or several near the edge of larger pots. They will readily root in a cold frame at that time of the year, and when rooted they should be shifted into pots of larger size, but care should be taken not to over-pot them, especially when small. R. falcata makes a loose terminal truss of flowers, and when in bloom it is very attractive. The old Crassula coccinea is so well-known it needs but little description, but as there is often some difficulty in inducing this to flower freely, special attention should be paid to getting the growths thoroughly ripened during the summer. The plants ought to be grown in the full sun, and if after flowering all the old flower stems are cut back and the pots stood where full sunlight will reach them, the growths will be short and sturdy, and the majority of them will flower the following summer. They must be kept rather dry through the winter, otherwise the wood will be too sappy to bloom. There is a neat little species known by the name of R. jasminea which does not grow more than six inches high, and this is a profuse bloomer, the flowers white, something like a jasmine. As a pot plant for decorative purposes this is very neat.

Kalanchoe flammea is a most useful plant either for decorative purposes or for the production of cut flowers. The seeds should be sown early in the year and treated in the same way as recommended for the crassula. Plants having one stem are preferable, as these, if well grown, will attain a height of from a foot to eighteen inches; the loose trusses of bright orange-scarlet flowers are produced at the ends of the growths, and the whole plant presents a neat and attractive appearance, and is very effective either for grouping or for single specimens for vases. When cut the flowers remain for a considerable time in a fresh state. A good batch of this ought to be grown in all gardens where a supply of cut-flowers is in demand.



NEW DRACÆNA DOUCETTI DE GROOTEI.
Leaves green, striped with greenish-yellow. F.C.C., R.H.S., May 26.
Messrs. Jas. Veitch and Sons, Lim., Royal Exotic Nursery, Chelsea.

One more subject worthy of attention, though not rightly belonging to this class, is Saxifraga pyramidalis. If strong plants of this are potted up in the autumn and kept in a cold frame through the winter, removing the lights altogether when the weather is favourable, it is astonishing what a wealth of blooms may be produced from so small a plant. During winter the pots may be stood close to each other, but as the flower spikes develop more room and light should be afforded them. This is one of those subjects that attracts so much attention in Covent Garden Market. When in bloom it is both light and graceful, and no plant that I am acquainted with is easier of cultivation and takes up less room.

With reference to Covent Garden I think it would be well if all gardeners who have any amount of decorating to do made themselves acquainted with this market, and I am quite sure that it would be to the advantage of many employers if they would send their gardeners to visit this market in the early morning, any time between the first of May and the middle of July. Having some little idea myself of what it means to grow plants by the thousands for decoration, and the short space of time one has to produce many of them, I am convinced that there are not many gardeners who have any idea of the quality and quantity of plants that find their way into this the finest and most flourishing market of the world's garden produce. It must, however, be borne in mind that private establishments cannot compete with this, for though in some places plants are done fairly well, it is impossible to devote a house to each and every class as is done by the market growers. The latter are not slow to understand what pays best, and having set themselves out to grow any particular class of plants they do it to perfection and leave all others alone. Gardeners in private places cannot do this. H. C. Prinsep.

THE BEST ROSES FOR GARDENS.

A short time since we gave the result of the ballot for the Nickerson cups offered for the best climbing and dwarf roses, and we now have the pleasure of giving some fuller particulars from the National Rose Society's book of arrangements for the current year. The list of varieties that obtained the first, second, and third places in the ballot has much value as a guide to those who grow a comparatively small number of roses for garden decoration.

In 1906, Mr. W. E. Nickerson, of Cambridge, Massachussets, U.S.A., presented the National Rose Society with three five-guinea silver cups, which were awarded respectively to the raisers of the best H.P., the best H.T., and the best T. for general cultivation which had been sent out in 1900 and subsequently.

With the same object in view, and in order to still further encourage the raising of roses which are especially suitable for general cultivation, and at the same time to assist the members of the society, and more particularly the smaller growers among them, in selecting the best varieties for different purposes for their own gardens, Mr. Nickerson last autumn offered to present the N.R.S. with twelve more five-guinea silver cups.

After a consultation with Mr. Nickerson as to his wishes, it was ultimately decided by the General Committee to invite the members of that committee and other leading rosarians, in this country and elsewhere, to underline in the voting papers sent them the variety in each of the twelve divisions, into which the competition had been arranged, which they considered best complied with the conditions laid down. There was no restriction as to the age of any variety or of the class to which it belonged. Eighty-three voting papers were in all received and the result of the ballot, which has only recently been decided, is as follows:

CLIMBING ROSES BLOOMING IN CLUSTERS.

Shades of Crimson.—1, Turner's Crimson Rambler, Cl. Poly. (33); 2, Gruss an Teplitz, H.T. (22); 3, Hiawatha, Wich. (16).

Shades of Pink. — 1, Dorothy Perkins, Wich. (52); 2, Blush Rambler, Cl. Poly. (8); 3, Minnehaha, Wich. (6).

White or Pale Blush.—1, Climbing Aimee Vibert T.N. (19); 2, Félicité-et-Perpétue, Evergreen (15); 3, Bennett's Seedling, Ayr. (10).

Shades of Yellow.—1, Alister Stella Gray, N. (40); 2, Claire Jacquier, Cl. Poly.. (13); 3, Aglaia, Cl. Poly. (12).

CLIMBING ROSES BLOOMING MORE OR LESS SINGLY.

Shades of Crimson.—1, Ards Rover, H.P. (22); 2, Reine Olga de Wurtemburg, H.T. (18); 3, Longworth Rambler, H.T. (16).

Shades of Pink.—1, Climbing Mrs. W. J. Grant, H.T. (20); 2, Climbing Caroline Testout, H.T. (17); 3, Papillon, T. (13).

White or Pale Blush.—1, Madame Alfred Carrière, H.N. (62); 2, Una, S. (11); 3, Macrantha, Species (6).

Shades of Yellow. — 1, William Allen Richardson, N. (23); 2, Gloire de Dijon, T. (13); 3, Madame Jules Gravereaux, T. (11).

DWARF ROSES.

Shades of Crimson. — 1, Hugh Dickson, H.P. (33); 2, Ulrich Brunner, H.P. (16); 3, Richmond, H.T. (8).

Shades of Pink. — 1, Caroline Testout, H.T. (24); 2, Madame Abel Chatenay, H.T. (21); 3, La France, H.T. (14).

White or Pale Blush. — 1, Frau Karl Druschki, H.P. (54); 2, White Maman Cochet, T. (10); 3, Viscountess Folkestone, H.T. (6).

Shades of Yellow.—1, Madame Ravary, H.T. (29); 2, Marie Van Houtte, T. (15); 3, Souvenir de Pierre Notting, T. (10).

N.B.—The figures in brackets indicate the number of votes given to each of the above thirty-six varieties.

At the society's exhibition in the Royal Botanic Gardens, Regent's Park, on July 3 next, a five-guinea cup, the gift of Mr. W. E. Nickerson, will, in accordance with the foregoing decisions, be awarded to each of the raisers, or their representatives, as the case may be, of the following roses, viz.: Turner's Crimson Rambler (Climbing Polyantha), Dorothy Perkins (Wichuraiana), Climbing Aimée Vibert (Noisette), Alister Stella Gray (Noisette), Ards Rover (Hybrid Perpetual), Climbing Mrs. W. J. Grant (Hybrid Tea), Madame Alfred Carrière (Hybrid Noisette), William Allen Richardson (Noisette), Hugh Dickson (Hybrid Perpetual), Caroline Testout (Hybrid Tea), Frau Karl Druschki (Hybrid Perpetual), Madame Ravary (Hybrid Tea).

At the same exhibition prizes will be offered for representative groups of the twelve roses which were at the head of the poll in their respective divisions, viz.: Turner's Crimson Rambler, Dorothy Perkins, Climbing Aimée Vibert, Alister Stella Gray, Ards Rover, Climbing Mrs. W. J. Grant, Madame Alfred Carrière, William Allen Richardson, Hugh Dickson, Caroline Testout, Frau Karl Druschki, and Madame Ravary.

There will be also another class for representative groups of the twelve roses which came out second in the ballot viz.: Gruss an Teplitz, Blush Rambler, Félicité et Perpétue, Claire Jacquier, Reine Olga de Wurtemburg, Climbing Caroline Testout, Una, Gloire de Dijon, Ulrich Brunner, Madame Abel Chatenay, White Maman Cochet, and Marie Van Houtte.

And a third class for representative groups of the twelve roses which occupied the third places in the ballot, viz.: Hiawatha, Minnehaha, Bennett's Seedling, Aglaia, Longworth Rambler, Papillon, Macrantha, Madame Jules Gravereaux, Richmond, La France, Viscountess Folkestone, and Souvenir de Pierre Notting.

Should the coming rose season be an early one the part of the exhibition in which these groups are shown should be one of special interest to a large number of the society's members, and especially those who are only able to find room for a small number of climbing roses in their gardens.

The names of the raisers of the foregoing cup roses and the years of introduction are, we would add, as follows.

Turner's Crimson Rambler (C. Turner, 1893).

Dorothy Perkins (Jackson and Perkins, 1901).

Climbing Aimée Vibert (Curtis, 1841). The only available record of the raiser and the year of introduction of this variety is contained in Mr. Gordon's comprehensive list contained in the last edition of the "Amateur's Rose Book." This variety was originally introduced as Aimée Vibert scandens.

Alister Stella Gray (A. Hill Gray. Introduced by Messrs. Paul and Son, in 1894).

Ard's Rover (Alex. Dickson and Sons, 1891).

Climbing Mrs. W. J. Grant (E. G. Hill and Co., 1899).

Madame Alfred Carrière (Schwartz, 1879).

William Allen Richardson (Veuve Ducher, 1878).

Hugh Dickson (Hugh Dickson, 1904).

Caroline Testout (Pernet fils-Ducher, 1890).

Frau Karl Druschki (P. Lambert, 1900).

Madame Ravary (Pernet-Ducher, 1899).

Asparagus. — This vegetable was a little later than usual this season in coming into bearing; but the crop is most satisfactory. Some fine heads have been cut, and there is at present a good supply coming forward. Gathering may be prolonged a little later than usual this season in consequence of it starting later. Some growers prefer to feed the roots while they are in active growth, which I firmly believe is the best practice. Salt and bonemeal are two good substances to apply. When the growths are well advanced they should be staked to keep the wind from breaking them down. — T. W. BIRKINSHAW.

SWEET PEA JOTTINGS.

On Easter Monday morning I called upon Mr. Clayton, The Butts, Brentford, to see his sweet peas. Now Mr. Clayton is an enthusiast. He obtained specially strongly-grown plants in pots, and planted them the day before Good Friday, when they were about ten inches high. The plants looked well, but my return home was through a blinding snowstorm, and there is no need to remind readers that subsequently there were other snowstorms, four inches of snow falling one day. I wondered how those sweet peas were faring, and rather fancied Mr. Clayton's ardour for early plants and early planting would be considerably cooled.

Late on Thursday evening, May 28, Mr. Clayton called round and expressed a very strong desire that I should go and see his sweet peas, then and there. So I went, and was astonished at the growth the peas had made. Of course, Mr. Clayton fully comprehends the value of trenching and manuring, but the daily and careful attention he gives his dozen rows is the real cause of his success. Some of the varieties, notably Mrs. Collier, Elsie Herbert, and Prince of Asturias, were about four feet high, and by the light of a couple of candles we found a dozen or so of expanded flowers on spikes about fifteen inches long, and crowds of spikes ready to burst into bloom in the course of a few fine days. Considering the weather experienced this struck me as being a very early date for the first flowers from seedlings of the present year.

Mr. Clayton limits his varieties to a dozen, but I hope to persuade him to grow half-rows of at least another half-dozen varieties. Roses and violas are other favourites with Mr. Clayton, and also with Mrs. Clayton, who takes a very keen and practical interest in the garden.

As a matter of course, we now expect sweet peas, and fine sweet peas, at the Temple Show, and we are not disappointed. Mr. Breadmore has staged larger exhibits, but it is doubtful whether he has ever staged a finer one than he had at the Inner Temple Gardens last week. He had spikes of H[illegible] Lewis from eighteen to twenty-two inches long, and carrying four and five fine blooms apiece and of glorious colour. He also [illegible] Mrs. Collier, very fine, while the white waved Etta Dyke was very beautiful.

Three varieties attracted my attention in Messrs. Dobbie and Co.'s group. These were The King, an almost scarlet waved variety of great beauty, not yet in commerce; Mrs. Andrew Ireland, a very [illegible]ing peach-pink waved variety that [illegible] quite distinct, and is certainly one of the prettiest of sweet peas; and Dobbies' [illegible] blue, a soft blue shade that deserves a place. With Burpee's White Spencer I was disappointed, because two-thirds of the flowers were not waved. It is too early to be [illegible]tive, but I fancy our English white [illegible], i.e., Etta Dyke, will take the lead in point of merit, just as it takes priority of [illegible]

Messrs. G. Stark and Son, Great Ry[illegible], again showed their scarlet seedling M[illegible] Stark, and it promises well, and they had splendid blooms of their re-selected [illegible] of Miss Willmott. I have several times [illegible] the last two or three years pointed out the [illegible]ger of this fine variety running out of [illegible]ter, and the need of very rigid and [illegible] selection to bring it back. Miss H[illegible] has, or had, a fine strain of Miss W[illegible] The bright pink Mrs. William King was [illegible] conspicuous feature of Messrs. E. W. [illegible] and Co.'s display.

Sweet peas are growing at a tre[illegible] pace just now, and it is evident they [illegible] taken a good grip of the soil. Thin[illegible] the growths, a tie here and there to [illegible] an even distribution of shoots, and [illegible] out the earliest flower buds are matters [illegible] constantly need attention. The flowers [illegible] may be left, but, as a rule, these very [illegible] blooms are not up to the high standard [illegible] keeps in view, and their production [illegible] check growth.

CHAS. H. C[illegible]

AMONG THE ALPINE FLOWERS.

Lithospermum purpureo-cæruleum.

This Gromwell is a great contrast to the one previously named, for while L. canescens is a neat, erect grower, L. purpureo-cæruleum is rampant in its way, and if left alone would soon ramble over a large space with its runners, rooting as it went. Then its colour is absolutely different, and is, to some degree, indicated by the most unwieldy specific name. It is also a British plant, and might thus not be thought worthy of special notice here. Yet it occurs in but few districts, and, like the native Pasque flower, is beautiful enough to deserve some care at our hands to find a fitting place for it in our gardens. Its rambling habit can also be restrained, much to its own advantage, as it flowers much more freely if its long, barren shoots are cut off or shortened, this inducing its flowering growths to bloom freely and to give their handsome clusters of magnificently coloured flowers. "Purple-blue," the English rendering of the specific name, is hardly descriptive enough of the fine colour, but it must pass for want of a better, and it is only when one compares it with the "divine blue" of the gentianella, as I have just done, that we can perceive how much of purple there is in the hue of this flower. It may be added that the flowering stems are erect and the barren ones prostrate. It is readily increased by means of the runners, and thrives all the better with a little limestone or old mortar in the soil.

A Black Pansy for the Rockery.

There is in cultivation in the hands of a few only, a singularly pretty little black pansy, or rather violet, which goes always by the name of "Mr. Bowles's Black Pansy," the Mr. Bowles being the accomplished flower-lover, who is at present the chairman of the Scientific Committee of the Royal Horticultural Society. It is dainty in size, is a free-grower of perennial habit, and the colouring is of the deepest velvety black, with the exception of a small, deep purple blotch and the golden eye so general in the pansy. On the rockery, it always draws notice to itself, notwithstanding its sombre colouring, which is more sombre at a first glance than after fuller observation, for this little velvety bloom is not by any means dull, and is not so "sooty" as the old black pansy some of us have known for many years. This one flowers freely, and the little blooms are quite charming in their way.

Other Flowers.

Flowers are many now, and we can wander long among them, pausing here and there to study the saxifrages, violas, cheiranthuses, erodiums, geraniums, gentians, anemones, trolliuses, erysimums, tiarellas, epimediums, spring phloxes, primulas, waldsteinias, ericas, aubrietias, arabises, mertensias, arenarias, dwarf rhododendrons, and the many more which have been induced by the fickle smiles of May to cheer us with their beauties.

S. Arnott.

HEMEROCALLIS CITRINA (BARONI).

From the number of day lilies available for cultivation it is possible to select six good garden plants, and from this six one that is superlatively good, and named H. citrina (Baroni), a true species, and very distinct from a hybrid day lily of the same name. It is a vigorous and floriferous plant, whose leafage is ornamental all the summer long, and whose flowers, of bold outline, are attractive 100 yards away. The foliage is in huge tufts a yard long, broad, and of graceful outline, and coloured dark glaucous green.

At midsummer a series of flower spikes, each exceeding a yard in height, are produced, and clustered at their summits are a series of prominent buds from ten to twenty in number, which develop into stout petalled flowers nine inches in extreme diameter, coloured canary yellow, with bronzed exteriors, and quaint-looking black tips to each petal.

My first impression of this plant, gleaned from a poor specimen, was not good, but last year I found several strong specimens thriving in various parts of Britain, and it is proving itself to be an excellent garden plant, entirely removed in point of quality of flower and general attractiveness from the rank and file of day lilies. Grouped by waterside, in the flower border or shrubbery's margin, where its graceful "lines" can have a perfect foil, it is a plant one can study indefinitely without tiring of it. Like most day lilies it is a gross feeder, appreciating a manurial mulch once or twice a year.

G. B. Mallett.

NEW TUBEROUS BEGONIA, EMPRESS MARIE.
Flowers pure white. A.M., R.H.S., May 26. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

THE ROCK GARDEN AT MULLABODEN.

Our rockery was constructed a little over three years ago. The site, before commencing operations, was a flat, uninteresting piece of ground, but by excavating for the winding pathway, and also by carting a quantity of soil to the spot, an undulating surface was formed on which the rockwork was built. It was also found necessary to bring a quantity of large shrubs and trees from other parts of the grounds to form a shelter from the north and east winds. The trees were mostly limes, and the shrubs consisted of Portugal laurels, yews, cupressus, and aucubas; one of the illustrations shows what an effective screen they have made.

The stones used were procured from the Wicklow Mountains, from a natural outcrop, where they had lain for hundreds (probably thousands) of years, and were much weather beaten, so that they were ideal material for a rockwork. When building the attempt made was to place the stones so as that they should look like the natural strata cropping out in various places, and yet to have them so that they would convey moisture to the roots of the plants.

The soil is of a sandy nature and very suitable for the majority of rock plants, yet a further addition of prepared compost, and in some cases peat, was made; and that this was apparently labour well spent is evidenced by the remarkable growth the plants have made, as they have quite filled up their allotted spaces. The subsoil is limestone gravel to a great depth, so that it was not necessary to provide artificial drainage.

A very common error was made when we commenced planting—viz., that of dotting the plants about. However, we rectified this afterwards by making good patches of from three to six plants in each patch. On the higher parts we planted groups of helianthemums, Veronica Traversii, and V. roseifolia, and Wichuraiana roses; these latter we found much too rampant and hard to keep within bounds, so they will be replaced by more suitable subjects.

We have not attempted so far to grow any of the minute and difficult sorts of alpines, but have confined ourselves to the more easily grown ones that make a good show at different times of the year. The following are some of the subjects that are doing specially well: Phloxes, stellata, frondosa, G. F. Wilson, and grandiflora; saxifragas, apiculata, Wallacei, hypnoides, Rhei superba, oppositifolia, pyramidalis, longifolia hybrida, Macnabiana, etc.; aubrietias, Leichtlini, Hendersoni, and Dr. Mules; arenarias, montana and balearica, the latter growing with ramondias on the shady sides of the rocks; Lithospermum prostratum, Onosma taurica, and campanulas also make a good show, particularly C. carpathica blue and white, C. garganica, C. muralis, and C. pulla; Saponaria ocymoides also makes glorious masses.

We have been and still are engaged in enlarging the rockery, as we find it such an interesting branch of gardening.

W. Mitchison.

Mullaboden, co. Kildare.

TEMPLE SHOW—MESSRS. JOHN WATERER AND SONS' EXHIBIT OF RHODODENDRONS, SPECIMEN HOLLIES AND KALMIAS IN THE OPEN.

THE ALTAIAN COLUMBINE.

There is still something for many gardeners to learn in the cultivation of the Altaian Columbine (Aquilegia glandulosa), as the thriving specimens one meets are few, and many flowerless plants which never "get on" represent the species in gardens. The late Mr. William Thompson, of Ipswich, reared beds of this handsome plant simply by sowing seeds in the beds in which they flowered. He held that transplanting adult plants always checked them, and that pot culture from infancy induced a restrictive growth throughout the life of the individual columbine, and it flowered less well accordingly. A singular instance supporting this view came under my notice last May, in which seeds of the Altaian columbine were sown in open borders, in the supposition that th were seeds of A. cœrulea. I have nev seen such plants as were then flower and the incident recalled Mr. Thompson observations.

It is evidently not an alpine, as it quires the best soil of the garden and a room for development therein. Suc magnificent plant as this is worth a litt effort to secure it in goodly quantity, its widely expanded rich blue flowers, wi white collarettes elegantly lobed, produced in hundreds from healthy pla and they give one a note of colour the border needs at this season. The (and parent) stock of the Altaian co thrives in the black loam of Inverne hence there should be no fear as to hardiness, whilst frequent seed s should maintain vigour in the best p way.

SHOW AND POMPON DAHLIAS.

TEMPLE SHOW—A FINE WEEPING STANDARD OF THE PINK MINNEHAHA ROSE.
Messrs. F. Cant and Co., Braiswick, Colchester.

In these days of modern ideas and new fashions I am afraid the old double dahlia, as known and admired during the past century by our ancestors, has fallen somewhat upon bad times. Their rigid form and general stiffness do not appeal to our present-day garden decorators, and from many gardens they are rigorously expelled, ousted by the more modern forms. Yet there is a something charming about the double varieties, and this charm grows upon the cultivator, silently, but surely. It is only the general horticulturist who scorns the idea of their decorative value.

I maintain that there are spots in a garden where the double show dahlias reign supreme for decorative effect, for the majority are not tall growers, but they carry their flowers well above the leafage on strong, stiff stems, and where a mass of one variety is planted together the particular colour employed will be bright and attractive until the frost comes. In the late autumn days they retain their colour long after the cactus varieties have become washy and of little value in the garden. This section still appeals to a large body of the artisan class, and there are hundreds of growers who revel in their culture, those who watch the development of their flowers as tenderly as a fond parent watches over a child. They see beauty in the large globular flower, the perfect shell-like petal, etc., though these things do not appeal to the general public. One is also sorry to note that this section is not nearly so popular now at our dahlia exhibitions; we seem to keep the same showmen, but where are the recruits?

Pompon Section.

The pompones are certainly more popular, and where room is limited they appeal more to the general grower. Quite a variety can be grown in a small space. There is also a greater variety of colours than in the old double forms. They can also be grown in vases or large pots; in fact, last season, I grew about fifty varieties in lard pails that I had painted green; these were stood on a wide gravel path, where they flourished splendidly, each plant carrying scores of miniature flowers. The only point to remember in their culture under these conditions is to keep them well watered. Dryness at the roots will soon stop growth, and consequently a succession of flowers. Feeding should also be avoided, for it has a tendency to produce large flowers, which are totally out of character.

Show Varieties.

These do not advance very much; in fact, I am under the impression they have remained at the same level for the past twenty years. Occasionally we obtain a new colour, but very few new varieties are introduced, and the majority of sorts have been in cultivation many years. A popular dozen would be Mrs. Gladstone, blush; R. T. Rawlings, yellow; John Walker, white; Prince Bismarck, rich puce; John Rawlings, heliotrope; Mr. Chamberlain, rich crimson; Mrs. Langtry, cream, edged crimson; Mrs. D. Saunders, lilac, tipped white; W. H. Williams, scarlet; Daniel Cornish, terra cotta; Dr. Keynes, rich buff; and Harrison Weir, primrose. A selection of fancy varieties I shall leave for a future occasion.

Pompon Varieties.

The selection in this class is not easy to make, for it is difficult to know what to leave out, as nearly all the present-day sorts are so perfect in form and colour, yet withal so distinct, that I doubt very much if any two growers would name the same sorts. The following are all good and distinct: Adelaide, blush, edged lavender; Arthur West, rich crimson; Darkest of All, nearly black; Emily Hopper, deep yellow; Nerissa, rose-pink; Violet, white; Little Bugler, rosy-purple; Bacchus, scarlet; Nelly Broomhead, mauve on a lighter ground; Phœbe, orange and red; Tommy Keith, cardinal red, tipped white; and Rosebud, white, edged heliotrope.

J. B. RIDING.

Strawberries.—To obtain strong early runners for plants to fruit early the following year, a suitable quantity ought to be grown expressly for the work, and should not be allowed to fruit. These plants will supply some capital early runners, and if these are pegged into small pots filled with loam, as soon as they are large enough, a good batch will be ready to plant out by July, and, if carefully attended to, these will make grand fruiting plants for the following year.—H. MARKHAM.

NEW PLANTS, ETC.

PÆONIA DECORA ALBA.

A charming free-flowering single pæony, with large, rounded, white, pink-tinted flowers of beautiful shape. The central bunch of stamens is pale yellow, and it shows well against the very palest pink tint of the surrounding segments. The ample leafage is light green, with a dull instead of a shining surface. A.M., R.H.S., May 26. Messrs. R. Wallace and Co., Colchester.

ODONTIODA CHARLESWORTHI.

The most wonderful new orchid in the Temple Show. It is the result of crossing Odontoglossum Harryanum with Cochlioda Noetzliana. It was a small plant, carrying an erect spike of four flowers and two buds. The form was good, and each flower measured about an inch and a-half across. The colour is deep and brilliant crimson-scarlet of the most vivid hue. The lip is of similar hue, a little paler perhaps at the apex, and with a rich, broad, golden-yellow colour at the extreme base of each segment, where they join the column and pedicel is a tiny bit of yellow colour. F.C.C., R.H.S., May 26. Messrs. Charlesworth and Co., Heaton, Bradford.

CYPRIPEDIUM VENTRICOSUM.

A new and very beautiful dwarf hardy orchid of about the stature of C. macranthum, and also something like it in the form of its flowers. The blooms are deep and bright purplish-rose colour, with a whitish margin around the comparatively small opening to the very large inflated lip. F.C.C., R.H.S., May 26. Messrs. Cutbush and Son, Highgate.

LÆLIO-CATTLEYA ELVA, WESTONBIRT VAR.

This beautiful and richly-coloured orchid had its name altered from Aladdin to Elva. It bore two splendid blooms, each four or five inches across without spreading out the broad petals. Both sepals and petals are intense and brilliant mauve-purple, while the lip is exquisite crimson-purple, with a violet-purple margin, and a yellow blotch at either side of the entrance to the throat. There are also a few dull gold lines extending from the throat into the velvety purple of the apex. F.C.C., R.H.S., May 26. Mr. H. Alexander, orchid grower to Major Holford, Westonbirt, Gloucester.

CATTLEYA MENDELI HIS MAJESTY.

It is rarely that a varietal form of an old species now receives the high award of a First Class Certificate, but Cattleya Mendeli His Majesty has so many good qualities that it secured this coveted award. It is an exquisitely beautiful and truly majestic variety, the flowers of largest size and finely proportioned. Sepals and petals are of a lovely delicate blush tint, while the lip is pure white, with a deep yellow throat and a diffused purple blotch just within the white-rimmed apex. F.C.C., R.H.S., May 26. Mr. Hopkins, gardener to F. W. Wellesley, Esq., Westfield, Woking.

ODONTOGLOSSUM ILLUSTRE LUXURIOSUM.

A very wonderful, rather than a very beautiful, orchid. The flowers are of medium size, of fairly good form, and there were eight of them on the spike. They had rosy tips and bases to the segments, but the rest of the area is deep ruby-crimson, the latter almost obliterating the ground colour. F.C.C., R.H.S., May 26. Mr. Charles Vuylsteke, Loochristy, Ghent.

ODONTOGLOSSUM EXIMIUM QUEEN ALEXANDRA.

A wonderfully fine odontoglossum, and one in which Her Majesty the Queen took an interest when visiting the Temple Show. The fairly large flowers have a blush or rosy ground colour, but this is only seen at the margin and at the bases of the segments, the rest of the flower being entirely of a deep rosy-crimson colour that shows on both sides of the segments. The lip is of deeper blood-red colour, with a small white apex. F.C.C., R.H.S., May 26. Mons. Charles Vuylsteke, Loochristy, Ghent.

ODONTOGLOSSUM LINDENI.

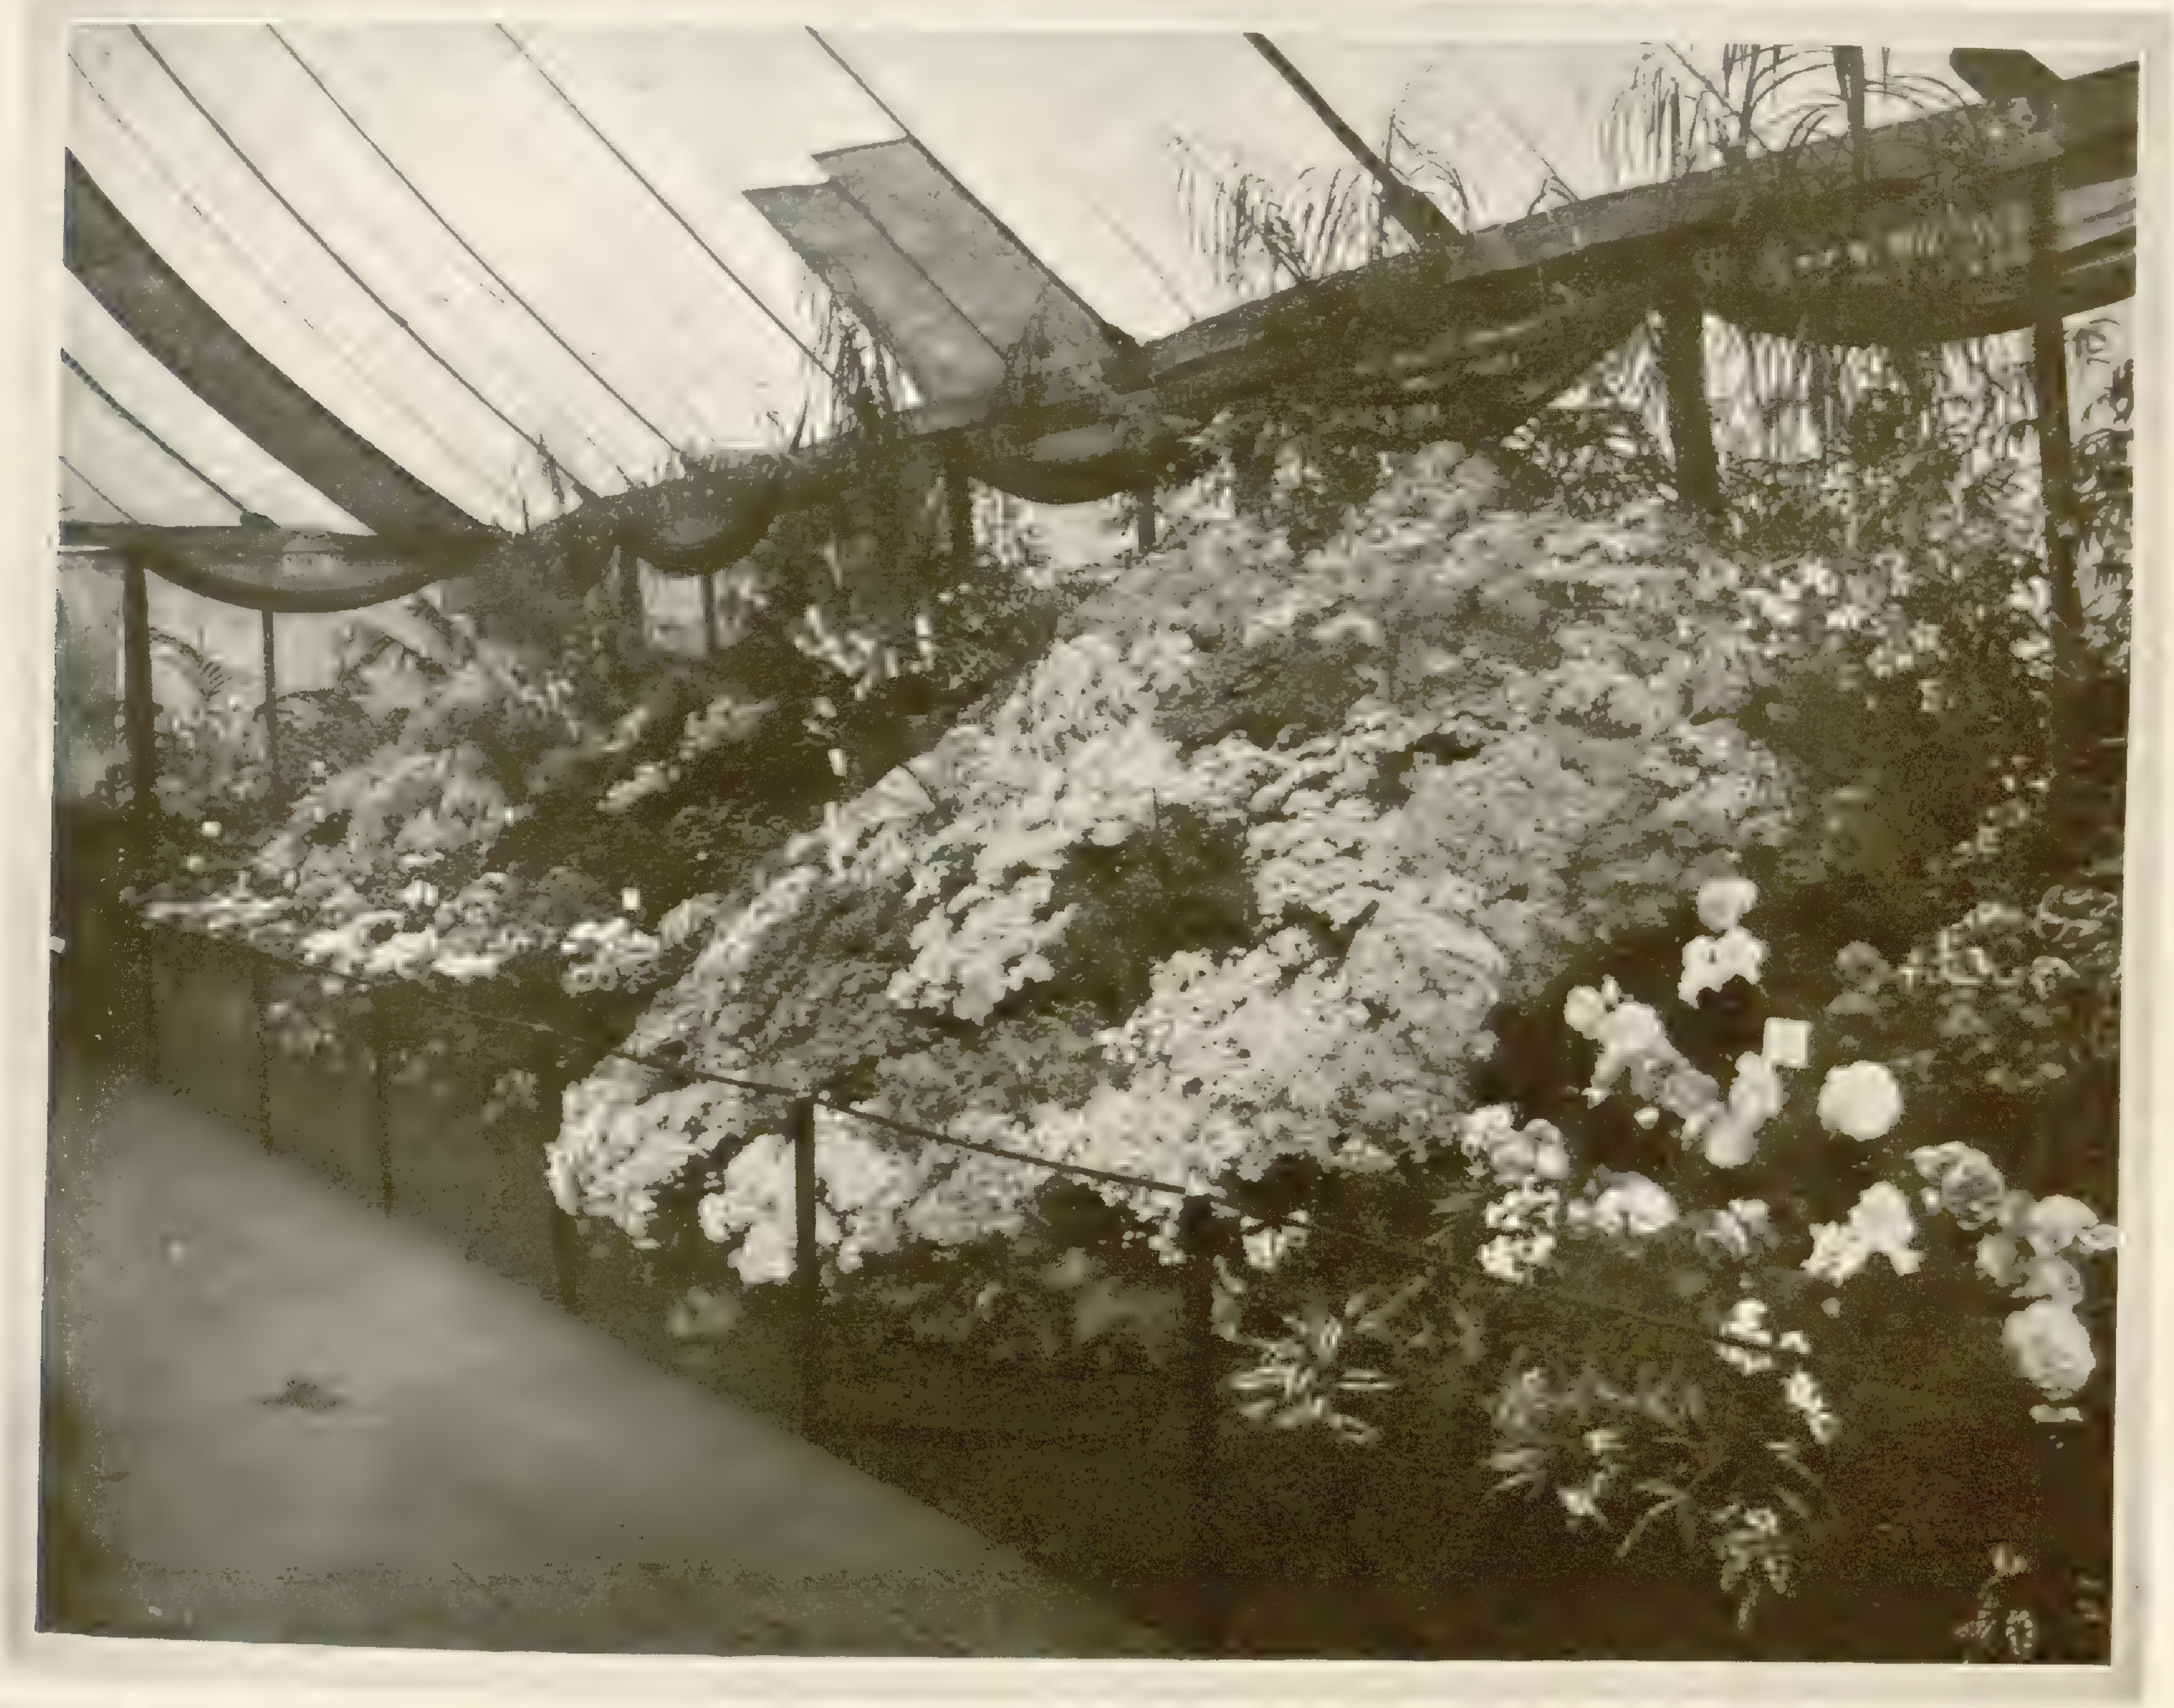
A rarely seen and old species. It produces a yard-long arching spike that carries its flowers towards the end often in short side branches. The flowers are about an inch across, and all the segments bend forward stiffly. The colour is wholly clear bright yellow. The short branchlets carry four or five blooms, the whole spike carrying over forty flowers. A.M., R.H.S., May 26. Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

CIRRHOPETALUM PULCHRUM.

A curious and pretty little orchid, that bears its buff, pink-spotted flowers in a sort of semi-circular umbel. The joined lateral sepals make up the most prominent part of the flower, about an inch and a-half long. The small petals and dorsal sepal and the lip are all soft red. A.M., R.H.S., May 26. Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart, Gatton Park, Reigate.

ODONTIODA ST. FUSCIEN.

A charming new hybrid derived from the intercrossing of Cochlioda Noetzliana and Odontoglossum Adrianæ. The flowers are small, an inch and a-quarter across, deep



TEMPLE SHOW—MESSRS. SUTTON AND SONS' FINE EXHIBIT OF STELLATE CINERARIAS, CALCEOLARIAS, NEMESIAS, GLOXINIAS, BEGONIAS, ETC.

buff ground colour, freely spotted with light scarlet, except at the margin, where the colour is rosy-crimson. The fiddle-shaped lip is pink, with scarlet shading at the base, and scarlet spots towards the apex. The bright yellow disc adds to the beauty of this little orchid. The spike carried ten expanded flowers. A.M., R.H.S., May 26. Mons. Henri Graire (gardener, Mr. Devos), St. Fuscien, Amiens.

ODONTOGLOSSUM LAUDATUM.

A handsome and beautiful odontoglossum, with large flowers, that have waved margins. The tips of the sepals and petals are rich rose-pink, and this colour runs in irregular lines through the greater area of bright reddish-rose colour. The lip is pure white, except for pink shading at the base, but it has a few deep red spots. A.M., R.H.S., May 26. Mr. Chas. Vuylsteke, Loochristy, Ghent.

ODONTOGLOSSUM CRISPUM KENNETH.

A finely formed and very beautifully marked variety. The spike carried five large blooms, with a blush groundwork, heavily and irregularly blotched and spotted with light bright red-brown. Lip and petals had fringed margins. One of the prettiest of blotched varieties. A.M., R.H.S., May 26. Mr. H. J. Chapman, gardener to Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne.

ODONTOGLOSSUM HIBERNICUM.

Though not an extraordinary odontoglossum, this is a hybrid well worth a place in a collection. It is the result of crossing O. Halli with O. hastilabium. The flowers are about three inches across, and have narrow segments. Sepals and petals alike are of a bright chestnut-brown colour, over a ground of light yellow, the latter showing in irregular lines through the brown, and also at the tips. The lip has a red-brown base and a wide, curiously-curled white apex. A.M., R.H.S., May 26. Messrs. Charlesworth and Co., Heaton, Bradford.

CATTLEYA MOSSIÆ LE PRESIDENT.

A fine and handsome form of a beautiful old species. It has very broad, fringed petals, and these and the sepals are rich rose-purple. The very large lip is soft purple with a golden throat, and gold veinings running out into the darker violet purple colour that is seen in the elongated frilled apex. A.M., R.H.S., May 26. Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

DRACÆNA DOUCETTI DE GROOTEI.

This is unquestionably a very fine form of the beautifully variegated variety of D. indivisa. D. Doucetti has now been before the public for several years, and its narrow, yellow-striped leaves, and light graceful appearance have made it a desirable, though still a comparatively rare plant. D. Doucetti de Grootei has rather broader and longer leaves than D. Doucetti, and the marginal stripe is a deeper yellow. It is a very fine dracæna for grouping or for large vases and hall decoration. F.C.C., R.H.S., May 26. Messrs. J. Veitch and Sons, Chelsea.

BEGONIA EMPRESS MARIE.

A superb double tuberous begonia, and the only one that secured an award at the Temple Show. The plant is of good habit and free flowering, and it has substantial blooms of the purest white, measuring about five inches across. Each bloom is perfect in form, like a big open rose, or a deep, broad-petalled water lily with a rosebud centre. A very fine thing. A.M., R.H.S., May 26. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

TULIPS.

Walter T. Ware.—A grand tulip of fine size and shape, and with rounded segments. The colour is intensely deep golden-yellow, and as the blooms are very solid the colour has unusual depth. It is a late-flowering tulip of the highest merit. F.C.C., R.H.S., May 26. Messrs. Walter T. Ware, Lim., Inglescombe, Bath.

Duchess of Westminster.—A splendid large cup-shaped Darwin tulip of the most brilliant pink, salmon-tinted hue. The interior is brighter, the flushing almost reaching a scarlet shade. There is a faint purple blotch near the base of each segment, but the base of the flower is yellow, and the anthers are purplish-blue. A.M., R.H.S., May 26. Messrs. Alex. Dickson and Sons, Lim., Newtownards, Co. Down, Ireland.

CROTON FRED SANDER.

A handsome, elegant, and effective croton, a little too dense perhaps for a table plant, but of great beauty for general decoration. The three-lobed leaves are very closely set on a yellow stem, and they have yellow footstalks. The ends of the three lobes and the margin of the narrowing basal portion of the leaf are all deep green, and within this colour the whole area is bright, but not very deep, yellow. A.M., R.H.S., May 26. Messrs. Sander and Sons, St. Albans.

DIMORPHOTHECA AURANTIACA.

A beautiful half-hardy annual from Namaqualand, and one suitable alike for greenhouse and conservatory decoration. It is of slender growth, about a foot or fifteen inches high, with elongated, entire, broadly-toothed leaves. The flowers, borne on footstalks about six inches long, are from two to three inches or more across, and the colour is brilliant yellowish-orange, shining as though polished. The bases of the petals are purple, forming a pretty ring round the blackish disc. A.M., R.H.S., May 26. Messrs. Barr and Sons, Covent Garden.

ROSES.

Tausendschon.—One of the most glorious and beautiful of rambling roses yet introduced. It is of strong growth, and its flowering shoots are long, bearing big terminal clusters of delightful and brilliant pink flowers. Each bloom is two inches or more across, and fairly double, the paler pink bases of the petals and the soft-yellow stamens showing in the centre. The variety is certain to become popular. A.M., R.H.S., May 26. Messrs. Wm. Paul and Son, Waltham Cross, and Messrs. Hobbies, Lim., Dereham. (See page 415).

Elaine.—A lovely new hybrid tea rose, with very broad solid petals of a lovely soft, clear, creamy-white colour. It makes up a large and very full bloom, and appears to be a good grower, free bloomer, and a very lasting variety. A.M., R.H.S., May 26. Messrs. Wm. Paul and Son, Waltham Cross.

White Dorothy.—This is a fine addition to the now very numerous and floriferous rambling and pillar roses of R. Wichuraiana origin. It is a white sport from and counterpart of the well-known, popular, and beautiful Dorothy Perkins. It is free and beautiful, and will make a fine companion to either Dorothy Perkins or Lady Gay. A.M., R.H.S., May 26. Messrs. B. R. Cant and Sons, Colchester (see page 421); and Messrs. Paul and Son, Cheshunt.

AZALEA OCCIDENTALIS GRACIOSA.

A very fine new variety that blooms with the greatest freedom, bearing large trusses of white flowers that are marked with yellow on the two upper segments. The unexpanded flowers are also very pretty, as the outside is palest pink with the yellow interior markings showing through. The variety appears to be of shapely growth, and is quite hardy, and as the flowers are sweetly scented, the plant is a very desirable one. A.M., R.H.S., May 26. Messrs. R. and G. Cuthbert, Southgate, N.

BULBOPHYLLUM MIRUM.

A very curious little plant with a still more curious, small boat-shaped flower, buff, heavily specked with crimson-brown. The species was exhibited as B. vibrans and so given in the official list of awards, but we understand it was subsequently identified as B. mirum, from Sumatra. B.C., R.H.S., May 26. Mr. Bound, gardener to Sir J. Colman, Bart., Gatton Park, Reigate.

THE PROFESSION OF LANDSCAPE GARDENING.

(Concluded from page 415.)

The professional course in this school is open to graduates of any college or scientific school of good standing as candidates for the degree of "Master in Landscape Architecture." The object of this course, to quote the official register, is to give the students a broad knowledge of many types of landscape and garden forms, of the elements which make up the quality of each, of the motives which underlie them when of artificial creation, of their limitations, and of the constant adaptation of means to ends in all good work. The instruction is in the form of lectures, supplemented by collateral reading, by informal conferences, and by frequent exercises in writing or drawing. The types of landscape and garden design are severally taken up in the historical order of their highest development, but in addition to the critical description of historical examples, with the aid of plans, drawings, and photographs, reference is made whenever possible to actual examples, illustrative of the same principles, to be found in the vicinity of Boston, which students may readily visit.

During the year each student is required to make a study of one example of formal and one of informal landscape work, one special type of landscape design, and one example of natural landscape, and to submit a report in each case. The length of the period of study necessary will depend upon the candidate's previous preparation. Two years will ordinarily be required by a capable student properly prepared. Any deficiencies in preparation can be made good after entering the school. Opportunities for advanced special study are open to students not candidates for a degree.

With the best technical training, the professional success of a landscape gardener must depend largely upon his ability to understand the wide range of purposes and ideals which he is sure to find among his clients, and in no way can this ability be fostered more effectively than by the broadening influence of a college education.

In addition to these studies, which form reasonable parts of a general college education, the undergraduate who looks forward to becoming a landscape gardener is advised to take the summer course in topographical and railroad surveying at the Harvard Camp, or its equivalent, and should become well acquainted with the common trees and shrubs. If he has had the opportunity of getting a first-hand acquaintance with the soil and plants through the common work of practical farming or some kindred occupation, he will find it, in the long run, helpful to a remarkable degree.

Any intelligent student will appreciate that he must have a good command of English, since an essential part of a landscape gardener's duties must be to explain clearly and convincingly to others the reasons for his advice to them. In addition it is very desirable that the student should be able to use French and German books with tolerable facility.

What is not so generally realised by students, in advance, is the vital importance to the landscape gardener of facility in graphic expression. He must be able to draw readily a simple, straightforward, and accurate representation of the forms which he sees or wishes to describe, whether by sketches, plan, or section, and the alphabet of this graphic language, which he must use all his life, ought to be learned early and practised constantly.

On the basis of such preparation a student can obtain a good professional equipment by three or even two years devoted solidly to technical work. No definite programme is here laid down for such a post-graduate course, because it can best be fitted to the needs of the individual; but it would always include two years of practice in general landscape design and details of construction, continued study of plants and planting design.

and, so far as not already studied, elementary architectural design, water supply, and sanitary engineering, masonry, and foundations, contracts and specifications, and such additional work in engineering, horticulture, and general landscape design as time and capacity permit.

It should further be said that while the training above discussed should make a student a useful assistant to a landscape gardener, it is not expected to turn him out competent to practice, and should be followed by at least two or three years of practical experience in the employment of an established landscape gardener, and, if possible, by travel for the study of professional subjects in this country and in Europe.

It may be recalled that a scheme of instruction was started at the Crystal Palace as long ago as 1881, under seemingly encouraging auspices. I have in my possession a book full of press eulogies and predictions published at its initiation, which make interesting and instructive reading. The scheme failed eventually, but, since the conditions attending its rise and fall are not likely to recur, it is unnecessary to consider it as an unfortunate precedent. It would be scarcely correct at this moment to call by name upon any educational body to take the matter into consideration. A necessary preliminary would be an expression of opinion favourable to the idea from the most influential bodies of the gardening world. If this were forthcoming one might hope to find in the City of London an institution with sufficient prestige, enlightenment, and resources to contemplate a serious handling of the question.

An influence of great weight with the managers, governors, or senate—whatever they might be—of such an institution would be the knowledge that any action taken by them in this direction would receive the cordial support of the Royal Horticultural Society.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

PHAIUS.—The hybrids of the so-called P. tuberculosus section, such as P. Cooksoni, P. Norman, in its varied forms, and the secondary hybrid, P. Clive, are producing their young growths. As soon as the roots appear at the base of the new growths any repotting requirements should be attended to. The plants must be carefully turned out of their pots, avoiding, as far as possible, damaging the roots that have attached themselves to the sides of the pots. The whole of the old potting compost must then be removed; cut away any dead roots, and the leafless back bulbs should be separated. If it is intended to grow large specimens, the pseudo-bulbs thus separated may be potted with the plants, but where it is desired to increase the stock they may be potted separately. Although the breaks from divided back pseudo-bulbs are not always strong, it is rarely indeed they fail to produce growths with us when placed in small pots. Being robust rooting when in good condition, liberal pot room should be afforded, especially so where large specimens are being dealt with. I consider every second year's disturbing for repotting purposes quite often enough. The pots used should be clean, and filled to about one-third of their depth with clean broken crocks. The potting compost we find suitable is two parts fibrous loam, the remaining portion consisting of peat and sphagnum moss, with sufficient finely broken crocks and coarse sand added to render the compost porous. In repotting take care to spread the roots out evenly, so that the compost may be worked well amongst them. Make the compost firm, and when potting is completed the surface may be covered with a layer of chopped sphagnum moss. Before setting the plants in position they should be watered with rain water, wetting the compost through. The conditions under which the plants are grown has but little effect on them here. We have tried them under practically all the different conditions we have, from the plant stove to the cool intermediate house. The only advantage, I think, to be claimed under cooler conditions is that the flowering season is retarded, and, the flowers being of greater substance, they are certainly more durable and last longer when used for decorations in a cut state. I would advise that the plants be grown under the same treatment as that usually found successful in the cultivation of the cool or winter-flowering section of cypripediums. Plants that have been repotted should be carefully shaded until the roots become established in the fresh potting compost. The atmosphere about them should also be reasonably humid, or the foliage is liable to attacks from red spider. Syringing overhead in bright warm weather will be found beneficial. The principal insect pests are thrips and scale; the latter are best removed by sponging the leaves, which must be done with care, for the leaves readily split where carelessly handled. The plants should also be sprayed and fumigated with vaporiser at regular intervals, which we find the best means of keeping thrips in check. The evergreen species, such as P. grandifolius, P. Wallichi, and their allies, may also be potted where they require it at the present season. We find that the conditions given above also suit these more robust kinds. Under the cooler conditions the growth is dwarfer and the flower scapes are also shorter, but the colours of the flowers are more brilliant. —H. J. Chapman, Oakwood Gardens, Wylam-on-Tyne.

TEMPLE SHOW—MESSRS. JAS. CARTER AND CO.'S EXHIBIT OF SCHIZANTHUSES, ETC.

STOVE PLANTS.

EUCHARIS. — Plants of eucharis that have now completed their growth should be placed where they will have a somewhat lower temperature of about 50 degrees. Here they may remain for two months, or a little longer if it is desirable to prolong their season of autumn flowering. During this period of rest they will require careful attention by reducing the supply of water at the roots, and the overhead syringing may be dispensed with altogether. This will assist the ripening up of the bulbs; the plants may also be subjected to more light, and gradually cease shading altogether. If thrips or aphis make their appearance on the foliage they may be quickly eradicated by fumigating with a nicotine compound. The leaves ought to be occasionally sponged with insecticide to destroy mealy bug or scale, which will often attack these plants.

GLOXINIAS.—These, as they finish flowering, ought to be placed upon a shelf near the glass, and have the supply of water gradually reduced until the tubers have become thoroughly ripened, after which the decayed leaves may be cleaned away and the tubers stored in some dry position until required again. Successional batches will also require attention; those showing flower buds will benefit considerably from applications of weak liquid manure. If this is given regularly it will greatly assist in prolonging their flowering season. The plants intended for autumn flowering ought to be now ready for their final shift. In most cases pots four to five inches in diameter will be found large enough.

POINSETTIAS which are now rooted in thumbs may be shifted into four-inch pots without delay, and if carefully sprayed a few times during the day, and also well shaded from the hot sun, very little damage will be done to the foliage. As soon as the plants become rooted again transfer them into cooler pits or frames, where they may be grown near the glass, and given abundance of light and air on all favourable occasions. Under these conditions the plants are kept more dwarf, and better ripened wood.

CREEPERS.—These plants continue to demand careful attention in the matter of training. Those which are grown for exhibition will require to be trained on the desired shapes as soon as the flower buds are formed. Those remaining in their permanent positions in the stove ought not to be allowed to ramble at will, or the plants underneath will suffer.

EDGING PLANTS.—A further supply of edging plants for the stove may now be raised from cuttings, such as Panicum variegatum, fittonias, and tradescantias. Place from four to six cuttings in three-inch pots, and keep them close for a few days. They will root very easily, and will develop into useful stock plants for autumn decoration.

GENERAL REMARKS.—The temperature of the stove houses ought to be kept at from 70 degrees to 75 degrees during the night, with an advance of 5 degrees to 10 degrees during the day. Continue damping down regularly during the day, and occasionally in the evening, with farmyard liquid water. An occasional rearrangement of plants is also much appreciated, and should be carried out at intervals as time at one's disposal permits of the work being done.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

EARLY VINES.—The crop of these being now fully ripe may have less fire heat, or only sufficient to keep the house somewhat drier. Plants are best removed from under these, except such as require little water. If the grapes are required to be kept a few weeks a light shading will be necessary. If the weather is hot this will also help to prevent red spider spreading. Carefully look over the bunches for any decayed or shanked berries, and do not allow the border to become dry. A liberal mulching of fresh horse manure will be beneficial to these, and syringe vines that have had the crop removed in the afternoon of a bright day, and allow the laterals to run.

MELONS.—As the fruits of the earliest plants are cut take out the old stems. Hero of Lockinge still continues one of the best for early supplies. Plants bearing fruits showing signs of cracking should be kept drier, but not so dry as to prevent their properly finishing. Sudden bursts of hot sunshine will very often cause the leaves to flag when the plant is healthy and vigorous. Especially is this likely to occur when the growths have been thinned out too severely. A thin piece of tiffany should be laid on the glass during the hottest part of the day. When the earliest crop is over it is advisable to clean the house right out and prepare it for a late crop. The plants for furnishing the second crop will be in full growth by this, and probably be in flower. They will at this time set more freely, and more frequently damping down may be given. As soon as the fruits are set copious supplies of water may be given, providing the drainage is in good order. If this crop is grown in frames, the linings must be renewed immediately the heat declines. During dull cold weather watering and ventilating must have careful attention. Close the frames early in the afternoon. Another batch of plants should be raised for the production of a late crop. Keep young stock away from old plants, and do not restrict the pot room or the water supply.

EARLY PEACHES AND NECTARINES.—The house containing fruits that are ripe or ripening should be kept drier, but not so dry as to affect the finishing of the fruit. Air, both at the top and bottom, should be admitted at night, and the pipes warmed to dry up moisture. If the fruits are ripening too fast a little shading may be used. Great case must be taken in gathering the fruits; they should be looked over in the early morning, as then the fruits are cool, and not so likely to be bruised. The border should not be allowed to become at all dry or they will finish prematurely and be of indifferent flavour. Clear water is best given at this stage. As trees are cleared of their fruits syringe them twice a day to induce them to grow freely. Liquid manure may be given after the crop is gathered.

MIDSEASON PEACHES.—Tie all shoots down that are to be left for fruiting next season, and cut out any useless or badly placed shoots. Stop the shoots against the fruits as soon as they are swelling. If the trees are healthy and the roots are in a well-drained border, plenty of water may be given. Weak liquid manure may also be applied, but till the stoneing period is over it is well to be careful with stimulants. Syringe them freely in dry warm weather, but remember that mildew will appear if the atmosphere is too humid. Water should not stand about in the house, and the pipes should be well warmed on dull days and nights, and a little air should be admitted at the top of the house.

STRAWBERRIES.—The late batch of these may be fruited in the cold frame. Give copious supplies of both liquid and clear water. Thin the fruits down to six or seven, according to the strength of the plants. Where no fire heat is given for these damping very often occurs owing to the bottom of the frame being hard and watertight. Water should be able to pass away,and traps should be put down. This is frequently one of the most important batches, especially if the season is late. Place, if possible, a few handlights over some plants in the beds outside. If this is done it will forward them considerably.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

EARLY CAULIFLOWERS.—Plants that were put into pots early will now be yielding heads, and those in cold frames are advancing rapidly. Give the latter plenty of water, with supplies of liquid manure two or three times a week, which will increase the size of the heads. When these are seen protect by bending the leaves over them. The earliest plants growing outside should be encouraged by frequently stirring the soil, and watering them when necessary. Those forming the successional batch have become a trifle blue in the foliage, owing to the cold winds experienced since they were planted out. But by attention to watering and keeping them clean they will soon recover.

THINNING OUT.—The thinning of such crops as parsnips, carrots, onions, and beet should now have close attention. By doing this work early the plants that are left will have a much better chance of becoming strong. Parsnips should be left fifteen inches apart in the rows, carrots eight, beet eighteen, onions nine. In some gardens the soil cracks badly when the weather is dry, therefore it is most beneficial to keep the surface soil loose by frequently hoeing between the rows. Onions that were planted out from pots and boxes early in last month should be given occasional waterings with liquid manure, and also dustings of soot.

EARLY POTATOES.—Those planted at the foot of south, east, and west walls should be well watered to assist them in swelling up the tubers. By this method of planting much earlier supplies are obtainable than from the open, and they are much easier to protect from frost if necessary. The main and late crops should be earthed up as soon as the tops are sufficiently advanced. Keep the weeds well down so as not to deprive them of the full advantage derivable from exposure to light and air.

TOMATOES FOR OUTSIDE.—If these have not already been planted, no time should be lost in bedding them out. They do extremely well at the foot of south walls, if such a valuable position can be allotted to them. They can also be grown with success in the open quarters and trained up stakes. Make the soil firm when planting out, adding a little bonemeal in the soil as the work proceeds. Should the weather be dry they will require copious supplies of water when they have become established. Train to a single stem, and keep all sub-laterals pinched back. If the season is suitable, it is astonishing what a large quantity of fruit these plants give, the fruit coming in most useful for culinary purposes for the early shooting parties.

LEEKS.—The first batch that was raised under glass, and pricked off into boxes or frames, should now be planted out in rows in the same manner as celery plants. Choose a quarter which has been deeply trenched and liberally manured, and if they can have plenty of stimulants through the growing season they will be most satisfactory. When they are wanted for exhibition suitable paper collars should be put on early, so that a good length of blanched stem may be obtained.—T. W. Birkinshaw, Hatley Park, Sandy.

Cucumbers.—Almost daily attention must be paid to stopping, thinning, and tying in the young growths. Maintain a moist atmosphere, and give copious applications of tepid liquid manure. Whenever the roots are seen on the surface give the plants light dressings of loam, half-decayed leaves and horse manure, and occasionally a little soot. Remove any old discoloured leaves, and do not overheat the water-pipes, or admit air on cold windy days, as this would favour red-spider. The night temperature should be from 65 to 70 degrees, while by day it may rise with sunheat 10 or 15 degrees higher. Admit air when the temperature reaches 75 degrees, and increase the amount gradually as the heat rises. Close the house early, and syringe with tepid water. Cucumbers are not only valuable for the salad bowl, but they are frequently boiled, and served as a separate vegetable. When cucumbers are planted out on fermenting material, and trained upon wires, it is most important to keep all ties loose, for if the material sinks down the plants are liable to be hung. [illegible] Ideal is an excellent cucumber for flavour.—T. W. B.

NEW BOOKS.

THE SUMMER GARDEN OF PLEASURE.

By Mrs. Stephen Batson. (Methuen and Co., 36, Essex Street, W.C.) Price 15s. net.

The appearance of this brightly written and charmingly illustrated book is most opportune at the present time, for it deals chiefly with the most important question of beautifying the flower garden during the season on which we are just entering, and while teeming with information of a practical character, it is a work that one can enjoy in the open air. The author, in giving the reasons which induced her to add another to the many books on gardening, states that her chief object is to assist the amateur with but limited resources. She writes: "In these days when specialist literature abounds we have many volumes, each on some particular phase of flower gardening—whether of rock, water, Italian, or other—and the 'common or border' gardener possessing but a limited patch of flat glebe seems likely to have his wants ignored. Yet the amateur who gardens on the level is trying to move with the times, although his field is only the old conventional strip of border ground. He longs after colour schemes as ardently as do his brethren with larger powers; he resents the hateful rout of August when, despite all his efforts, Nature seems to have ceased to support him in his labours, so that his borders in late summer are almost as bare as they were in March. And, as the humble border gardener is a member of the very largest class of flower cultivators, he should have attention paid to his needs in the light of the evolution of gardening." We do not share the views of Mrs. Batson with regard to the neglect to provide the amateur gardener with horticultural literature, but with her charming book before us we do not regret that she holds them.

The opening chapter is devoted to the wild garden, and we are in full agreement with the opinions to which she gives expression on this aspect of gardening. She avoids the mistake made by so many writers of describing wild gardening as so simple a matter that it may be engaged in by almost anyone with the full assurance of success. On the contrary, she states very plainly that there is "no more difficult problem than that of wild gardening," and that "it is certainly not a pursuit for the inexperienced." We are also told, "there is no ideal in gardening that so powerfully holds the imagination of the indolent as that of the wild garden. There is no subject on which more impracticable advice has been given, none in which more grievous mistakes have been made. Nothing would seem more easier than to plant a wild garden and to reap its fruits in a long succession of years, wherein little or no labour is involved. Yet this result is far removed from that which the idealist discovers for himself when he puts his faith to the test."

Having thus obtained the best possible proof of Mrs. Batson's practical acquaintance with the cultivation of hardy plants, in a manner as closely approaching nature as is possible in the garden, we proceeded to read the chapter with special interest, and we derived much pleasure, and it is to be hoped, some profit from its perusal. She appreciates the possibilities of the wild garden, and enjoys to the full the flower-bedecked meadow, woodland, and orchard, but she is anxious that those who are desirous of engaging in wild gardening should understand something of its difficulties, and be prepared for the exercise of some thought and skill. The advice given on the making and management of the wild garden is thoroughly sound, and especially deserving of the most careful study on the part of those who are desirous of beautifying the grounds beyond the boundary of what is regarded as the garden proper.

The chapter entitled "Incoming Summer" is especially interesting, for therein Mrs. Batson endeavours, and with much success, to show the difficulties inseparable from efforts made to maintain a continuous display of flowers during the greater part of the year, and to explain the means by which these can be overcome. We have on many occasions directed attention to the desirability of supplementing the hardy perennials, both in beds and borders, with a few of the best of the half-hardy plants that grow and bloom freely in the open during the summer months, and with hardy and half-hardy annuals. It is therefore of interest to us to read that, in the opinion of the author, "there is a lesson in gardening that many of us are either unable or unwilling to learn while we are yet beginners, and, indeed, in some cases, even when we are comparatively experienced growers of flowers, and this lesson is that it is impossible to make a single plot of ground to look gay all the year through." As the author subsequently points out, we begin in April with a brave show of daffodils, wallflowers, and representatives of a dozen other genera. There may be a slight bareness in May, but in June there is a satisfactory display, for, observes Mrs. Batson, "it is a poor gardener who cannot have his borders gay at midsummer." The plethora in June continues into July, but by the middle of the month there is so great a falling off as to suggest that in a few weeks there will be but few flowers in the borders. In the following month there is what is described as "the rout of August." Therefore it is essential that an endeavour should be made to associate with the herbaceous plants a sufficient number of plants that bloom in August to produce an attractive display of flowers during that month—and, indeed, until the Michaelmas daisies and other plants blooming in September are yielding freely of their floral beauty. The inclusion of the finest of the annuals is strongly advised, and these and other suitable subjects are dealt with at some length in the two chapters entitled "The Rout of August," and "Waning Summer."

There are, in addition to those mentioned, chapters on "Hardy Primroses," "Border Irises," "Herbaceous Pæonies," "High Summer," "Larkspurs," and "Border Lilies," and these are not less remarkable for the admirable manner in which they are written than for the information they contain. The work is embellished with thirty-six full-page illustrations in colour from drawings by Mr. Osmund Pittman, who has been especially successful in his treatment of garden scenery.

"The Summer Garden of Pleasure" is written in so entertaining a style, so rich in information on matters relating to beautifying the flower garden during the summer months, so thoroughly sound in its teaching, so freely illustrated in colour with beautiful garden scenes, that we strongly recommend it to the notice of garden lovers, and especially to those who prefer to acquire knowledge in the most pleasant manner possible.

LA MOSAICULTURE PRATIQUE.

By Albert Maumené (Librairie et Imprimerie Horticole, 84bis, Rue de Grenelle, Paris). Price, 3.50 francs.

An admirably written and profusely illustrated book on what is commonly known as "carpet bedding" in this country. M. Maumené is a past master in the art of garden decoration, and his work can hardly fail to be of much value in France, where this form of flower garden decoration still obtains. Mosaiculture, or carpet bedding, has practically been banished from gardens in this country, otherwise we should suggest to those of our readers in need of information, and able to read French, that they could not well have a more trustworthy guide. There are two hundred and fifty illustrations in black and white, and four coloured plates of arrangements of carpet bedders.

A BOOK ABOUT SALADS.

By Albert Broadbent, F.R.H.S. (Albert Broadbent, 257, Deansgate, Manchester.) Price, 3d.

An interesting brochure, containing much useful information on salad plants, salad-making, and salad dressings.

PANSIES AND VIOLETS.

By D. B. Crane, F.R.H.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price, 1s. net.

Although there is no lack of works on pansies and violets, the most recent contribution to the literature of these flowers has so much to recommend it to the consideration of cultivators that it is especially welcome, and should attain to a high degree of popularity. The author has long given much attention to the tufted and other pansies, and has achieved much success as a cultivator, exhibitor, and raiser, his greatest achievement being, perhaps, the development of a race of compact-growing and free and continuous blooming violas that are of special value for garden decoration. We mention this as proof of the fullness of his knowledge of the flowers, and we would add that he possesses in a marked degree the ability to convey his knowledge to others.

The book, while written for amateurs, will be found not less useful to practical gardeners, for every phase of culture is fully dealt with, and full directions are given for staging the flowers at exhibitions and for dealing with insect and fungoid pests that prey upon the several classes of pansies and sweet violets. Classified lists are given of the varieties best adapted for the decorative and other purposes, and these have been so carefully prepared as to contribute very materially to the value of the book.

THE NATURE BOOK.

(Cassell and Co., Lim., London.) Part I., price, 7d.

The first part of "The Nature Book" gives excellent promise of the completed work, being one of the most interesting and beautiful books relating to the varied delights of the open air that has yet been published. There is a plentiful supply of literature that makes constant appeal to the lover of Nature as well as to the desire for a more intimate knowledge of country life, but there is no work with which we are acquainted so comprehensive in scope, or that can compare with it in general interest, or in the wealth of its illustrations. The part before us gives evidence of the work having been planned on generous lines, and shows that birds, clouds, flowers in field and garden, animal and insect life, the sea-shore and its wonders, mountain, rock, river scenery, and trees will in their turn receive ample attention. The subjects dealt with in the part include: "Mice of the Field," "How to Know the Clouds," "How to Know the Wild Flowers," "How to Know the Birds," and "The Beech and the Oak."

Each subject is profusely illustrated with photographic reproductions, and for the most part these are decidedly good, but, as so frequently happens, some fail to reach a high standard. To photograph wild flowers in situ is extremely difficult, and in the photographs used to illustrate the Rev. H. Puretoy Fitzgerald's article Mr. H. Irving has been very successful, excepting with the lesser celandine. This was evidently taken with the lens pointed almost vertically upon the plants, with the result of the illustration, although technically good, failing to convey any idea of their manner of growth. It rather suggests a plant trained to a trellis. The other reproductions of wild flowers are as near perfection as we can hope to see them. The illustration that will probably the most strongly appeal to Nature lovers is the reproduction of Mr. C. Kearton's photograph of the sedge warbler feeding a young cuckoo. In addition to the illustrations in black and white, there is a reproduction of Mrs. Allingham's beautiful water-colour drawing of a Kentish garden.

OBITUARY.

MRS. S. ARNOTT.

It is with deep regret that we record the death of Mrs. S. Arnott, which occurred at Sunnymead, Maxwelltown, Dumfries, on Saturday, the 30th ult., after a long illness.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.—TWENTIETH ANNUAL SHOW, SOPHIA GARDENS, CARDIFF, Wednesday and Thursday, July 22nd and 23rd, 1908.
Liberal Prizes for all sections.
Silver Plate, Cups, and Medals.
Every facility given to the Trade. Schedules free.
Mr. A. MAURICE BAILEY, Secretary,
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
July 1st and 2nd, 1908.
TWELFTH GREAT ANNUAL FLORAL FETE.
£650 IN PRIZES. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for
"TRADE EXHIBIT"
(for particulars see page 10 in Schedule).
Valuable SPECIAL PRIZES offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.
Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

RICHMOND HORTICULTURAL SOCIETY.
The 34th ANNUAL SHOW
Will be held in
THE OLD DEER PARK, RICHMOND, SURREY,
on
WEDNESDAY, 24th June 1908 (Entries close 17th).
Schedules and all particulars from
W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

SHREWSBURY GREAT FLORAL FETE.
Aug. 19th and 20th, 1908.
Cash Prizes are offered amounting to above £1,200, with Cups, Medals, etc.
Schedules may be had, post free, on application to the Hon. Secs.
Messrs. ADNITT and NAUNTON, Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

The Temple Show.

We now give the report on the miscellaneous subjects, and the outdoor groups at this great exhibition, which was unavoidably left over last week.

MISCELLANEOUS.

Somehow dahlias in May do not seem to be quite in place, but nevertheless the crowd of visitors did not fail to approve of the flowers set up by Messrs. Carter, Page, and Co., London Wall. Amongst the varieties were Premier, crimson; Daisy Easton, yellow; Ibis, scarlet; Decima, orange; and Alexander, deep crimson. On the whole the exhibit was a good demonstration of what is possible in the way of forcing dahlias.

Messrs. Kelway and Son, Langport, contributed a collection of beautiful single and double pyrethrums, and tree and herbaceous pæonies, these latter including Mrs. W. Kelway, Queen Alexandra, Miss B. Jones, Louise Michelet, and Henry Irving.

Mr. H. H. Crane, Highgate, staged a very complete collection of viola blooms in distinct varieties. Lark, Admiral of the Blues, Hawke, Mabel, and Peace were amongst the varieties which were much admired.

Mr. John Forbes, of Hawick, sent a lot of large-flowered pansies, with pentstemons forming a background, and the scarlet zonal Black Vesuvius in front. Messrs. Lister and Son, Rothesay, had a very nice collection of violas, amongst which a number of good varieties were represented.

Messrs. Dobbie and Co., Rothesay, made a very fine display with their violas and pansies, and there was something very novel about the collection of chrysanthemums set up, though expressions of opinion were heard that these flowers were somewhat out of season in May. Crimson Marie Masse, Horace Martin, and Tuckswood Early were amongst the chief varieties.

OUTSIDE GROUPS.

Every year more space seems to be taken up by exhibits in the open air, and we have never seen a finer lot of groups than those displayed at the show we are reporting. Messrs. James Veitch and Son deservedly won a gold medal with a fine collection of plants, mostly of a flowering character. Azaleas were very beautiful, and we heard many expressions of approbation respecting the clematises, schizanthuses, rambler roses, hydrangeas, laburnums, and other plants. Myosotidium nobile in tubs was exhibited by J. D. Enys, Esq., of Enys, Cornwall.

A big collection of red and white bottle brush plants, Metrosideros, was exhibited by Messrs. Hugh Low and Co., Bush Hill Park, and the novelty of these things was the subject of frequent comment. A grand bank of stuff was set up by Messrs. D. Russell and Co., Brentwood. Flowering trees and shrubs and foliage plants formed the group, and in the arrangement of the above much taste was displayed. A very effective group of Malmaison carnations was set up by Messrs. Hugh Low and Co. on the turf outside the tents. The same firm also had a group of rambler roses, including finely-flowered specimens of Lady Gay, Hiawatha, Crimson Rambler, and the diminutive Baby Dorothy. The group from Messrs. Cutbush's nursery at Highgate was a work of art. In temporary pools, made for the purpose, aquatic plants were shown. Azaleas and eremuri figured in the background, and in front were groups of Primula japonica, incarvilleas, lupins, Phlox Laphami, dainty cypripediums, verbenas, daisies, and a host of other plants. This group came in for much well-deserved praise.

It is not usual to exhibit alpines in the open at the Temple, but Mr. W. P. Horton had a tasty little exhibit of this kind. Age and veneration were represented in the collection of pigmy trees set up by Messrs. Carter, and, judging from the remarks overheard, it was the curiosity of the pigmies that attracted most attention.

Acers figured largely in the group set up by Mr. L. R. Russell, of Richmond, and they were certainly very effective, but plants that also came in for admiration were plants of Vitises Henryana and Coignetiæ, while the ivies, cornuses, and aralias were very effective.

Messrs. J. Cheal and Sons had a big group of foliage and flowering trees and shrubs, in which acers, clematises, rhododendrons, and azaleas were well represented. Very showy indeed was Messrs. Richard Smith and Co.'s group, in which the beautiful Rhododendron Pink Pearl figured with great effect. Messrs. W. Fromow and Sons, of Chiswick, were represented outside by a large and comprehensive group of acers. Rhododendrons were the feature of the group set up by Messrs. John Waterer and Sons, Lim., Bagshot, though the standard hollies and laurels were also attractive. A very nice border was made to the group by a line of the yellow Spanish furze in pots. Messrs. Thomas Cripps and Sons, Tunbridge Wells, had a grand collection of acers and other plants, in which a large number of varieties were represented. Messrs. Pulham and Son, Broxbourne, succeeded admirably in their hastily-made representation of a rock garden, and the rock, pool, stone paths and plants looked as if they were quite permanent fixtures. It is hard to say whether topiary work is admired in these days, but whether this is so or not, quite an interest was displayed in the fantastically cut box trees shown by Messrs. W. Cutbush and Sons, many of which were undoubtedly quite unique. Mr. Maurice Prichard, of Christchurch, exhibited a very pretty collection of alpine and hardy herbaceous plants and flowers that came in for favourable comments.

Messrs. Barr's pigmy trees were closely inspected by a host of people who were much interested in the small but ancient specimens, many of which were trained in peculiar if unnatural forms and shapes.

British ferns formed the background of Messrs. H. B. May and Sons' interesting exhibit, and in the front were baskets containing verbenas in variety, Lobelia Waverley Blue, coleuses, ivy-leaved pelargoniums, pansies, and dwarf roses. This was a highly interesting exhibit.

Messrs. Castle, Westminster, S.W., sent specimens of their garden furniture in the shape of teak wood tables and seats, and, needless to say, the latter were taken full advantage of by people who sought rest after the somewhat tiring walk through the tents.

Paris Spring Show.

The annual spring show of the National Horticultural Society of France was opened on May 22, and continued till the 29th. There was a large and representative gathering of all branches of French horticulture, and most of the well-known nurserymen were exhibitors in their various specialties.

On entering the grounds there is a fine promenade leading to the two large greenhouses, in which the shows of the society have been held since 1900, but in which they will cease to be held after next November, the municipal authorities having decided on the demolition of these fine glass structures. It is only to be hoped that some other suitable provision will be made for these important displays. Along the promenade we noticed groups of hardy plants and flowers by various exhibitors, and a fine collection of trained fruit trees by M. Nomblot-Bruneau, and another by Messrs. Croux et Fils.

As the visitor entered the first large greenhouse a blaze of colour greeted him. Roses, begonias, and zonal pelargoniums, besides other showy subjects, were here in great profusion. Messrs. Leveque et Fils had a large and distinctly imposing array of the flower with which their name is inseparably connected, and there was a large collection of standard roses. M. George Boucher was also an exhibitor of roses. M. Ad. [illegible] is another who set up standards in a long row alongside the greenhouse. We [illegible] our old friend M. Aug. Nonin had several interesting groups, one of roses, including Robert Levavasseur, Hiawatha, [illegible] Dorothy Perkins, Blush Rambler, and many more in the different sections.

There were two rooms set apart in the greenhouse for the orchid collections, [illegible] and various in the productions of such well-known growers as Messrs. Beranek, [illegible] A. Regnier, Maron et Fils, and R. [illegible] Passing onwards we noted the magnificent sheets of colour produced by the different displays of zonal pelargoniums arranged, as is usual here, in beds on the ground [illegible] M. E. Poirier had several composed of varieties essentially French, all with big trusses and arranged in masses of white, salmon, pink, and crimson. Standard zonals were [illegible] staged by the same exhibitor. M. [illegible] Charmet and M. Paul Feron exhibited each a fine batch of novelties. In fancy pelargoniums M. Barillet is an important exhibitor.

Tuberous begonias and the Rex varieties were strongly in evidence. M. Billard always makes a fine display of his single and double-flowered varieties. M. E. [illegible] Ferard, and M. Guillois entered in the [illegible] class. There was a magnificent display of Gloire de Lorraine by M. Rob. [illegible] whose huge pots of well-flowered plants [illegible] visible all over the show.

In the large corridor uniting the two greenhouses there was a large square [illegible] entirely with rhododendrons and azaleas from Messrs. Croux et Fils. Some of the specimens were giants in size, and [illegible] in profusion. Messrs. Moser et Fils [illegible] an excellent show of the same kind and dimensions.

Here also was the enormous display from Messrs. Vilmorin Andrieux and Co., comprising a collection of hardy plants and flowers arranged in numerous beds of every-varying design. Large numbers of stocks, lupins, verbenas, ageratum, poppies, columbines, petunias, mignonette, asperula, sweet peas, etc., were displayed, but the piece de resistance was certainly the charmingly arranged water scene, which evoked the keenest interest. In the distance was a rockwork, with water falling over the rough masses of rock into a winding stream beneath. On each side was a green turf lawn, dotted here and there with numerous plants, aquatic and otherwise, the whole occupying a considerable space, and forming a work of art in artificial garden construction.

We can only briefly notice a few of the other exhibits. M. Geo. Truffaut staged on a neatly arranged little grass lawn a handsome display of roses in vases, and a huge central exhibit of carnations. Oriental and other poppies were staged by Messrs. Cayeux and Leclerc, Toreador, Proserpine, Olga, Mahony, Leandre, and Hy. Cayeux were fine examples. The same firm had hardy flowers in another group. A large batch of Anchusa italica, edged with yellow calceolarias, pyrethrums, funkia, heuchera, centaurea, in variety, etc. M. Ch. Molin had tulips in great variety, pæonies, lilacs, iris, etc., also an exhibit of nymphæas in tanks. M. Dessert showed pæonies in over 100 varieties. M. René Guillois had gloxinias, M. Aubert Maille a fine batch of a new white anthemis called Perfection. M. Thiebaut Legendre hardy plants, M. Jobert Maxime put up a big group of Primula obconica, and M. Férard had quite a number of groups of hardy plants in various parts of the show. Pansies came from M. E. Falaise, tulips ard anemones from Messrs. Angel et Fils. In a miscellaneous group M. Aug. Nonin showed some fine specimen begonias, viz., Deliciosa, Lucerna, Gigantea, Jean Lotte, General Lianley, and Alleryi. Cactus, amaryllis, hydrangeas, and bougainvilleas also figured in quantity. An interesting group of Iris Kæmpferi was sent by M. Tabar.

Fruit was, of course, less plentiful than at the autumn show, but there were several interesting lots staged. The Forceries de la Seine sent peaches and nectarines. The Grapperies de Somain had, in neatly arranged baskets, some grapes, such as Frankenthal, Foster's Seedling, and Gros Colman. Another grape exhibitor was M. A. Mercier. An imposing display, artistically arranged in six handsomely constructed glass cases was staged by Messrs. Cordonnier et Fils. Some fine examples of plum The Czar were sent. Grapes comprised Black Alicante, Madresfield Muscat, Foster's White Seedling, Frankenthal, etc.

Vegetables in season were largely shown by Messrs. Vilmorin, Andrieux and Co. Beans, peas, lettuces, radishes, celery, leeks, onions, carrots, endives, artichokes, asparagus, tomatoes, etc., were displayed in endless variety in four large beds arranged on the steps leading down to the banks of the Seine, and at the bottom was another large display of the same kind from the Société Mutuelle des Jardiniers et Horticulteurs.

Bristol Gardeners' Association.

The first meeting of the summer session was held on Thursday, May 28, at St. John's Parish Rooms. Mr. A. O. Shelton presided over a very good attendance.

"Herbaceous Plants for Small Gardens" was the subject of the address by Mr. J. C. House, who said there are many disadvantages with small gardens, but better times were, he believed, coming, as many things point to the provision of larger gardens. Mr. House gave much useful advice on the formation and arrangement of gardens, and also a list of suitable plants, these including doronicums, trollius, geums, centaureas, heucheras, iris, poppies, pyrethrums, aquilegias, pæonies, delphiniums, gaillardias, and phloxes. With a little management the flowering season could, he said, be considerably extended.

Mr. House was awarded a special certificate for a splendid collection of cut flowers, which included some of the newer varieties of oriental poppies. A medal and three framed certificates were presented to the four under gardeners making the best attendance during the past session. For two pots of schizanthus, Mr. Morse, gardener to Sidney Humphries, Esq., was first, and Mr. Perry second.

H. W.

The Royal National Tulip Society.

The fifteenth annual Southern Exhibition of this society was held on Tuesday, May 26, in the Lecture Room of the Royal Horticultural Society's hall, Vincent Square, Westminster, and, owing to the great show at the Temple Gardens absorbing the attention of visitors, the gathering was almost completely forgotten by many who are interested in the tulip. The exhibits were just sufficient to fill the tables placed round the sides of the room named, and there were entries in all the classes, some of the competitors travelling long distances to bring their productions to the show.

The flowers shown were generally bright and clean, but in several cases somewhat lacking in size and substance, but, taking the exhibits as a whole, they made a beautifully varied display, with both brilliant and soft tints in due proportion.

Taking the classes in the order of the schedule, the following were the winners of the prizes, and the principal blooms staged. With twelve dissimilar rectified tulips, two feathered and two flamed of each class, there were four competitors, Mr. C. W. Needham, Kelmscott, Hale, Cheshire, the hon. treasurer of the society, won the first prize—a silver cup—with handsome examples of these varieties arranged in the following order: Back row, Sir J. Paxton, Stockport (the premier feathered flower), Annie McGregor, and Samuel Barlow; middle row, Talisman, Mabel, Royal Sovereign, and Nimbus; front row, Mrs. Lea, Masterpiece, Talisman, and Sarah Ann. The second prize—a silver medal, went to Miss Willmott, Great Warley, Essex, whose blooms were very close in merit to the first, and the colours excellent. Mr. J. W. Bentley, Stakehill, Middleton, and Mr. Peters, Cambridge, were third and fourth respectively.

In the corresponding class for six tulips, one feather and one flamed in each class, Mr. Bentley took the lead, his flowers comprising Talisman (two blooms), Sir J. Paxton, Aglaia, Garabaldi, and Julia Farnese. Again Miss Willmott was second with good flowers, followed by Messrs. Needham and Peters. With three feathered blooms the prizewinners were Messrs. Needham and Bentley, Miss Willmott, and the Hon. A. H. T. de Montmorency, Carrickmines, in the order named; while in the corresponding class for three flamed flowers Mr. Bentley and Miss Willmott were first and second, Messrs. Needham and Peters being third and fourth.

Breeder tulips were represented in two classes, and constituted a very beautiful portion of the show. Miss Willmott won the chief award—a large silver medal—for the best six breeder blooms, two in each class, and her exhibits were the following: Annie McGregor (premier breeder bloom), Alfred Lloyd, Goldfinder, Talisman, Leach's No. 1, and Mrs. Barlow, a grand lot of flowers of the richest and most charming colours. The remaining prizes went to Messrs. Bentley, Needham, Peters, and A. D. Hall, Harpenden, all showing extremely well. For three breeder tulips Miss Willmott was again first, followed by Messrs. Bentley, Needham, and Peters.

In single bloom classes the exhibits were numerous and good, the prizes going in this order, the varieties following each name. Feathered Rose.—Mr. Needham, first with Alcestes, and third with Andromeda; Miss Willmott, second with Mrs. Collier, fourth with Sarah Headley, and fifth with Miss Nightingale.

Flamed Rose.—Mr. Bentley, first with Annie McGregor; Mr. Peters, second with Mabel, and fourth with Heroine; and Miss Willmott, fifth with Sarah Headley.

Feathered Bizarres.—Mr. Needham, first with William Annibal, second with W. Wilson, and fourth with Attraction; Mr. Bentley being third with Masterpiece, and Mr. Hall fifth with Richard Headley.

Feathered Byblœmens.—Mr. Needham was first with Mrs. Hepworth, second with Stockport, third with Bertha, and fifth with Mary Agnes, Miss Willmott being fourth with Bessie.

Flamed Byblœmens.—Mr. Bentley took the first four prizes with these varieties in the order named: Adonis, George Edward, Talisman, and Chancellor, Miss Willmott being fifth for Miss Jackson.

Flamed Bizarres.—Mr. R. W. Hall, Cambridge, was first with Samuel Barlow, Mr. Needham second for the same variety, Mr. Peters third with Sir Joseph Paxton, and Miss Willmott fourth and fifth with Dr. Harvy and Lord Stanley.

Bizarre Breeders.—Mr. Needham, first and fourth with Alfred Lloyd, and Samuel Barlow, Miss Willmott taking the second, third, and fifth prize with Cyrano, Goldfinder, and Sulphur.

Byblœmen Breeder.—Miss Willmott secured the first, fourth, and fifth prizes with Northern Light, Grania, and Leach's No. 1; Mr. Peters was second with Diarmid, and no name was attached to the third prize flower. In the rose breeder class Mr. Peters was first for a seedling, and Miss Willmott fifth for Rose Hill, no other names being given.

The Samuel Barlow prizes for the best pair of rectified tulips, one feathered and one flamed of any class, were awarded in this order. Silver-gilt medal to Mr. Bentley for William Annibal; a silver medal to the Hon. Montmorency for Julia Farnese, a neat bright bloom; the third and fourth prizes going to Miss Willmott for Sir J. Paxton, and to Mr. Needham for G. Hayward.

Five classes were appropriated to growers of less than 400 flowering bulbs of English tulips, and the exhibits were of considerable merit throughout, the chief honours being adjudged to Mr. R. W. Hall; Mr. J. F. Kew, Southend; the Hon. Montmorency; Mr. Leonard S. Loat, Oxford; and Mr. H. P. Bartleet, Shooter's Hill.

A delightful part of the show was that devoted to the classes for garden tulips, and for twelve varieties Mr. Loat won first honours with handsome flowers, the most notable varieties being Rosette, large rose; Picotee, white, edged pink; Parisian Yellow, Primrose Beauty, Gesneriana major, Leghorn Bonnet, yellow; Emerald Gem, La Merveille, and Gesneriana lutea. Darwin tulips were also well shown by Messrs. Bartleet, Loat, and Montmorency, and Mr. Loat had a beautiful mixed collection of species and varieties.

Altogether the exhibition was a satisfactory one, and the arrangements were well managed by the hon. secretary, Mr. W. Peters.

The British Gardeners' Association.

The annual meeting of the above society was held on May 27 in the Essex Hall, Essex Street, Strand, when Mr. Chas. Foster presided over a gathering of about 100 members. These, with a few exceptions, were residents in the Metropolitan district, and it was a subject of regret that provincial members were not more numerously represented, since the latter constitute a large majority of the total list.

After the secretary had read the minutes of the previous annual general meeting, the report for 1908 was taken as read, and the Chairman proceeded to move its adoption by the members in an exceptionally able, calmly-reasoned speech. He congratulated the association on the remarkable progress made in the past four years, but especially in that dealt with by the report. To obtain a membership of nearly 1,300 in so short a time was an exceptional result, and few horticultural bodies could point to so conspicuous an advance. The B.G.A. desired to prove that it was not only their object to benefit their members, but it was also thought that the interests of employers would be best studied by providing them with qualified men. It was hoped that better understanding would be promoted between employer and employed by keeping to a quiet, reasonable policy. No more striking proof could be afforded that the course adopted was regarded as satisfactory by a large number of gardeners, than by what occurred at the last meeting of the Executive Council, when 78 new members were elected.

Referring to the "B.G.A. Journal," the Chairman remarked that it was now well established as a monthly organ of the association, and it had already done a great amount of good in helping forward the work in hand. The pages were open to all members to express their views, and it had helped to bring those in widely-separated districts in closer touch and sympathy with each other. In one point particularly it had done useful work, for the subscriptions had certainly been paid more promptly since the issue of the paper.

Mr. Foster proceeded to refer to the educational matters the B.G.A. have in view, and especially to the provisional scheme of examination which had been brought forward. He was of opinion that when this had been thoroughly discussed, it would, in an amended form, prove of great service, if carried out carefully. Some expense must be incurred to do so, but the status of gardeners would be raised, all the younger men encouraged to improve their knowledge, thus demonstrating their fitness for more ample consideration in wages and other matters.

In referring to the work of the B.G.A. provincial and Metropolitan branches, Mr. Foster commented on the fact with marked approval that some of these, particularly the more recently-formed ones, were applying themselves to the educational requirements of gardeners with excellent effects. If, as the branches increase in numbers, the same feeling is carried out generally, the association as a whole, and members individually, will be substantially strengthened.

The question of appointing a permanent paid secretary, the Chairman said, had been thoroughly considered, and the conclusion was that, in view of the work before the Executive Council, the present state of the finances would not admit of the suggested expenditure. Excellent work had been done under the present system upon most economical terms, and it was impossible to see how any plan could be substituted that would be more advantageous to the association.

The adoption of the report was seconded by Mr. E. F. Hawes, who entered fully into an explanation of the financial statement, and emphasised the fact that the work had been conducted upon a satisfactory and economical basis. The expenses had amounted to £209 6s. 3d., leaving a balance of £260 12s. 10d., only £1 of which was owing to the association, and the liabilities were nil. The income from members' subscriptions during the past year had been £141 1s. 6d. The secretary's honorarium for 1906 and 1907, the payment of which came within the financial year just closed, amounted to £47, and the payment to the editor of the "B.G.A. Journal" was £8 12s. 1d.

After several questions had been asked and answered, Mr. W. Watson (Kew) opposed the adoption of the report, as he did not consider the B.G.A. was carrying out the programme set down in "the plea" originally distributed, and which he proceeded to read. This led to some interruption, and criticism from several members, and as the general opinion appeared to be against any prolonged discussion, it was decided to put the adoption of the report to the meeting, when it was carried by a large majority, only four voting against it.

The scrutineers—Messrs. R. L. Castle and E. F. Hawes—next presented their report of the ballot for the election of members of the Executive Council, from which it appeared that the eight who had secured the highest number of votes were: Messrs. Chas. Hill (211), Donald Campbell (201), E. Skelton (198), T. W. Sanders (172), A. Lampard (157), A. T. Little (153), W. C. Modral (147), and C. P. Raffill (138). The ratification of the ballot was then carried by a large majority.

The Chairman stated that Mr. E. F. Hawes had resigned the office of treasurer, which all would regret, and he expressed the thanks of the members for the services he had rendered. Mr. Thomas Winter was then duly proposed and seconded as treasurer, and the motion was carried unanimously, Mr. Winter acknowledging the compliment in a few appropriate words.

Mr. Foster referred to the appointment of secretary, and recommended the re-election of Mr. J. Weathers, who had had experience and had performed much useful work in an admirable manner. Mr. Witty seconded the proposition, which was also supported by Mr. Brown, of Chertsey, and others. Mr. W. Watson nominated Mr. Little, of Kew. In the result, Mr. J. Weathers was re-elected by a large majority. Mr. J. Harrison Dick was elected one of the auditors, in the place of Mr. Tinley, who retires in accordance with the rules, and after some minor business had been transacted, the meeting concluded with a unanimous vote of thanks to the chairman.

Kew Guild.

The annual meeting of the Kew Guild is always held on the eve of the Temple Show, and the venue is the Holborn Restaurant. There was a moderate attendance, presided over by Mr. W. Watson. The report presented gave ample evidence of the prosperity of the Guild, as the life members now number 254. The chief feature of the report was the recommendation of the sub-committee that the policy of the guild should be changed, and that one of the objects of the body should be the advancement of its members. It was suggested that this recommendation should be submitted by circular letter to every member of the guild, and should only become operative if two-thirds of the members voted for it.

Several speakers evinced some anxiety as to the scope of the recommendations, and strongly urged that nothing approaching trades unionism should be adopted. Rash statements by young men newly arrived in India and the colonies were deprecated, and so, later in the evening, were the statements issued at the instance of the Kew branch of the Government Employees' Union, statements regarded by many as tending to belittle the influence of Kew as a horticultural educational establishment, and, consequently, tending to depreciate Kewites.

The balance-sheet showed income amounting to £64 5s. 2d., and a balance in hand on the year's working of £20 9s. 2d. It may be added that Mr. Watson and Mr. W. J. Bean become vice-presidents, Mr. W. W. Pettigrew, of Cardiff, president for the ensuing year, and it was hoped that Mr. H. H. Thomas would accept the post of treasurer.

The annual dinner was presided over by Mr. W. W. Pettigrew, who was supported by the officers of the guild, a number of old Kewites, including Mr. Lane from Calcutta, and Mr. Derry from Singapore, and most of the present Kewites.

After dinner the loyal toast was duly honoured, and the President proposed the toast of "Success to the Kew Guild," and in doing so he strongly urged present Kewites to cultivate each other's friendship while at Kew, as he had found that such friendships were helpful in after life, and by them old memories could be easily revived. He also paid tribute to the great educational value of the Kew lectures, and of a stay at Kew, but he suggested that the certificates should be granted after an examination if they were to be of any real value. He further strongly urged that the guild should use its influence upon Kew and other authorities for the purpose of securing State and University recognition of horticulture, just as agriculture is recognised, as he believed such recognition was deserved, and would aid horticulture materially and raise the status of horticulturists.

The response to the toast was from Mr. Daydon Jackson, in the unavoidable absence of Mr. W. Botting Hemsley, F.R.S. Mr. Jackson agreed with the President's remarks anent the cultivation of friendships by the young men at Kew, and also the educational value of Kew, and State recognition of horticulture.

In proposing the toast of "The Chairman," Mr. R. Hooper Pearson pointed out Mr. Pettigrew's capabilities as a landscape gardener in the construction of Roath Park, Cardiff; as a good gardener, as seen in the splendid upkeep of the Cardiff parks under his superintendence; as an educationalist in his efforts to instruct those under him in all pertaining to their profession, and he urged that these virtues well qualified Mr. Pettigrew, as a good guilder, to occupy the chair, and become president for the year.

The toast was most heartily received and accorded with musical honours, and Mr. Pettigrew modestly responded.

During the evening Mr. Watson referred to several notable absentees, especially alluding to the unavoidable absence of Mr. Hemsley, and of their good old friend Mr. G. Nicholson, who, the members were glad to hear, was a little better, and could be taken out into his beloved Kew Gardens in a bath chair. The musical part of the programme was efficiently rendered by Miss Isabel Watson, Mr. Watson's elder daughter, who played and sang admirably; Miss Walter and Mr. Briscoe, the latter an old Kewite. Many old friendships were renewed and new ones made during the half-hour interval or "half-time" always allowed after dinner, when those present rise from the tables and mingle with each other.

Dutch Bulb Growers' Society.

At the meetings of May 4 and 11 the following awards were made by the Narcissus Committee:

First-class Certificates to: Narcissus Alaska, broadly opened trumpet, deep yellow and deep yellow perianth; narcissus Van Waveren's Giant, an enormous flower with deep yellow trumpet and pale sulphur perianth; narcissus John Pope, with deep yellow trumpet and clear yellow perianth; narcissus President Wentholt, broadly opened trumpet, deep yellow, and yellow perianth; narcissus Robert Sydenham, a strong grower with deep yellow trumpet and yellowish perianth; and narcissus Incomparabilis Winifred, with broad, elegant cup and white perianth.

Awards of Merit were given to: Narcissus Harry Veitch, a clear yellow trumpet daffodil in the way of Emperor, but larger; narcissus Cornelia, a self-coloured yellow trumpet daffodil; narcissus Theba, a deep-yellow trumpet daffodil of fine form and great substance; narcissus White Pioneer, pure white trumpet, narrow tube-shaped and starry perianth; narcissus Incomparabilis Louise, pure white perianth and lemon-yellow cup, a distinct flower of medium size; narcissus Incomparabilis cristata with peculiarly crested cup of yellow colour, perianth cream-white; narcissus poeticus Bianca, pure white, very fine round flower; narcissus poeticus Glory of Lisse, a fine round flower with rather large cup; and narcissus poeticus Verdi, with large crown, broadly bordered deep orange.

In addition to the awards mentioned above, a gold and a silver-gilt medal were given to collections of new narcissi.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (June 6) contains the following:

WHAT TO GROW IN A FOWL RUN.
USING SURPLUS MILK.
SHALLOW PAN CREAMING.
HORSES' LEGS WEARING.
WEAKLY PIGS.
DRAFT EWES.
COLONY HOUSES.
OUTDOOR TOMATOES.
BEE KEEPING NOTES.
REPORT OF BATH AND WEST SHOW.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET,
London.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for [illegible] in the GARDENERS' MAGAZINE. He will be greatly obliged by correspondents sending [illegible] of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

ARUMS AND HEDYCHIUMS.—J. C., Southampton: The arums that remain dormant during the winter should be potted up directly they show signs of growth. They need warm greenhouse treatment at this period, and great care must be taken not to overwater them until root action is brisk. Hedychiums love a moist atmosphere, brisk heat, and bright sunshine in their earlier stages of growth, if they are to attain the largest size, and flower abundantly. They are not really hardy, although they will survive an ordinary winter if protected, and in a warm locality. Give the plants the warmest and brightest corner of the house, and if the pots are well filled with roots give frequent doses of liquid manure. After they have flowered they may be placed out of doors in a sunny spot to ripen up. Repotting is best done as new growth commences.

CUCUMBERS.—H. G., Hereford: The cultivation of cucumbers for market is dealt with in "Mushrooms, Cucumbers, and Tomatoes," the fourth of the "Farm and Garden" series of handbooks. The book is 1s. 2d. post free in paper boards, and 1s. 9d. post free in cloth binding, from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.

SUMMER BEDDING.—G., Kent: It would be possible to produce a very fine effect with the seven large beds, provided one prepared a design at the end of the summer, and made arrangements for propagating a stock of plants especially for the design. A day in the London parks would give you many ideas suitable for carrying into effect at home. We do not know what the surroundings are like, but unless there is some very strong reason against it we should alter the arrangement of the beds. Seven huge circular beds in a row do not appeal to us. If the central bed were a [illegible] one, with square ends, and the second bed from each end of the same shape, the general effect would be better, and you would have more scope in planting. However, the thing to do at present is to make the best of the conditions and materials. A few of the largest pyramidal fuchsias would do for the central bed, with Calceolaria amplexicaulis planted thinly among them, and with heliotrope for a groundwork. The beds on either side of this might well be of Plumbago capensis, ivy-leaved pelargoniums, and Hyacinthus candicans. For the two end beds we suggest the standard fuchsias rising over the dwarf calceolaria, with ivy-leaved pelargoniums alternating with the fuchsias, and kept at about half their height. The remaining two beds should be reserved for the [illegible] with the herbaceous lobelias rising [illegible] and above them. A few of the eulalias, if they are very light plants, and not dense [illegible], could also be used here. If you need an edging to any of these beds, then use a [illegible] that contrasts rather sharply with the general tone of the bed. The two raised beds should, if we understand the conditions rightly, be filled with plants with light and [illegible] foliage, or those bearing bright flowers, because of their proximity to the [illegible] and the not far distant shrubs. [illegible] marguerites, variegated abutilons, eulalias, cannas, Streptosolon Jamesoni, and Calceolaria amplexicaulis, suggest themselves as suitable, but we do not know what your stock of plants is for this purpose. It is essential in the case of raised beds that the groundwork be well chosen and well grown, otherwise the soil surface, being nearer the eye than usual, will be unpleasant.

FAILURE WITH STRAWBERRIES.—A., Sussex: There is a considerable difference of opinion as to whether galvanised wire-netting is injurious to crops beneath it or trained upon it, or not. If the wire is painted no evil results follow its use; but where it is unpainted there are, sometimes, failures that can only be attributed to the wire which becomes oxidised, and an oxide is carried to the plants below by the rain, to their injury. We cannot say whether your strawberries are suffering as a result of the wire covering or not; but we hardly think the wire is the real cause of failure, because we know of plantations of gooseberries, etc., and also of bush apples, covered in with galvanised wire, and without any evil consequences. Soil, climate, and cultivation may all be more or less responsible for the failure, but as you give us no information in regard to those matters we cannot help you as we could wish; nor do you say how high the netting is. Try a few strawberries without the net covering, and closely observe the difference between them and those under cover.

PREPARING FOR ROSES.—R., Walsall: Trench the ground two spits deep, and place a good layer of cow manure in the bottom of the trench, and a layer of older cow manure between the two spits of soil. Leave the surface rough, and do not permit weeds to grow. In the autumn, a little while before planting, choose a fine day for forking the soil over, previously adding a good dressing of wood ashes and burnt earth—not ballast—as these will supply the potash, of which your soil is deficient. The other materials you suggest had better be left alone for the present. Order your plants early, and plant as early in October as possible. Write us again at planting time, and remind us of the page in which this reply appears.

FLOWERS FOR MARKET.—D. A. S., Abbeyleix: A very large number of flowers sent to market are put up in dozens, and the flowers are arranged to all face one way. The bunches are tied firmly but not sufficiently tight to cut or bruise the stems. The blooms are all arranged to face one way, as packing is thereby rendered easy, and there is little injury. Firm packing is necessary, and a little practice will show how closely flowers in bunches may be packed in the shallow wooden boxes now so largely used for them. In the majority of cases the only packing material used is white, or whitey-brown paper. Most of the salesmen supply boxes to those who forward flowers to them, but the large growers use their own boxes, either returnable or non-returnable. So far as we are aware there is no book dealing with the packing of flowers for market. You would find it well worth your while to attend a flower market very early in the morning to see how flowers are packed, handled, and sold; indeed, a visit to Covent Garden Flower Market would, in your case, fully repay the cost incurred. Write to Mr. D. Ingamells, Flower Market, Covent Garden, London, W.C., who will gladly send particulars.

CLUB ROOT.—F. G., Southampton: It will be quite safe to plant out next month on ground that was gas-limed in March. If the gas-lime was fresh and used freely it should have killed every bit of vegetable life, and all the pests it came into contact with, consequently the club infestation should be materially reduced. It would have been far better could you have given the plot a rest from greenstuffs for at least a clear year. Before planting dip the roots of each plant in a mixture of soot and lime in equal parts, mixed with water to the consistency of thin mortar, and with a little flowers of sulphur added. Reject every plant that shows the slightest tendency to swell at the roots. Afford ample room, plant firmly, and hoe freely.

BENGER'S Food
for Infants,
Invalids,
and the Aged.

The particular and important feature of Benger's Food is that it can be prepared to suit any degree of digestive power, according to the directions on each tin. In this way it wins back health and strength.

The "Lancet" describes it as "Mr. Benger's admirable preparation."

NAMES OF PLANTS.

E. H., Cottingham.—Berberis Darwini.

M. B., Ticehurst.—1, Cytisus hispanica; 2, Ceanothus thyrsiflorus; 3, Piptanthus nepalensis.

W. M. C., Hanley.—1, Dianthus alpinus; 2, Opuntia ficus-indica; 3, Sparmannia africana; 4, a garden form of Iris Germanica.

O. R. G., King's Lynn.—1, Hemerocallis fulva; 2, Berberis Darwini; 3, Pelargonium crispum; 4, probably Pelargonium pumilum.

J. W., Winchester.—1, Maianthemum convallarioides; 2, Orchis maculata; 3, Anemone sylvestris; 4, Achillea ageratifolia; 5, Rubus deliciosus.

R. E. S., Somerset.—1, Magnolia grandiflora; 2, Euonymus japonicus latifolius albus; 3, Cytisus monspessulanus; 4, Viburnum tomentosum; 5, Pittosporum undulatum; 6, not recognised, send when in flower.

H. W., Shepherd's Bush.—The small piece sent is insufficient for identification, but we feel almost certain it is a tiny shoot of an anthericum. As it is impossible to say what species it is, until we see flowers, we suggest you keep it in the greenhouse. So far as we are aware, there is no red-flowered anthericum, and we fancy your friend has made a mistake. Give the plant fairly rich, light soil, and a sunny place, in an airy greenhouse, and let us have a piece of the spike when it flowers.

TRADE NOTE.

At the Bath and West of England Show, held at Dorchester, Messrs. E. Webb and Sons, Stourbridge, had a very large exhibit of the wheats and barleys for which they have become famous. Grasses and potatoes were largely staged, and fine strains of cinerarias, calceolarias, schizanthuses, and gloxinias added much to the effectiveness and brilliance of the display.

The Culture of Flowers, Fruit, Vegetables, etc., at a glance.

Bound in Cloth. PRICE **3/6** NET. By post **3s. 10d.** 454 Pages.

TWELFTH EDITION—With 22 pp. Addenda.

ENCYCLOPÆDIA OF GARDENING.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening," etc.

A COMPLETE DICTIONARY OF FLOWERS, FRUITS, VEGETABLES, PLANTS, TREES AND SHRUBS.

CONTENTS.

Planting.—When and How to plant.

Position.—Where the plants are best grown—whether in sun or shade.

Soil.—The exact soil required by each genus.

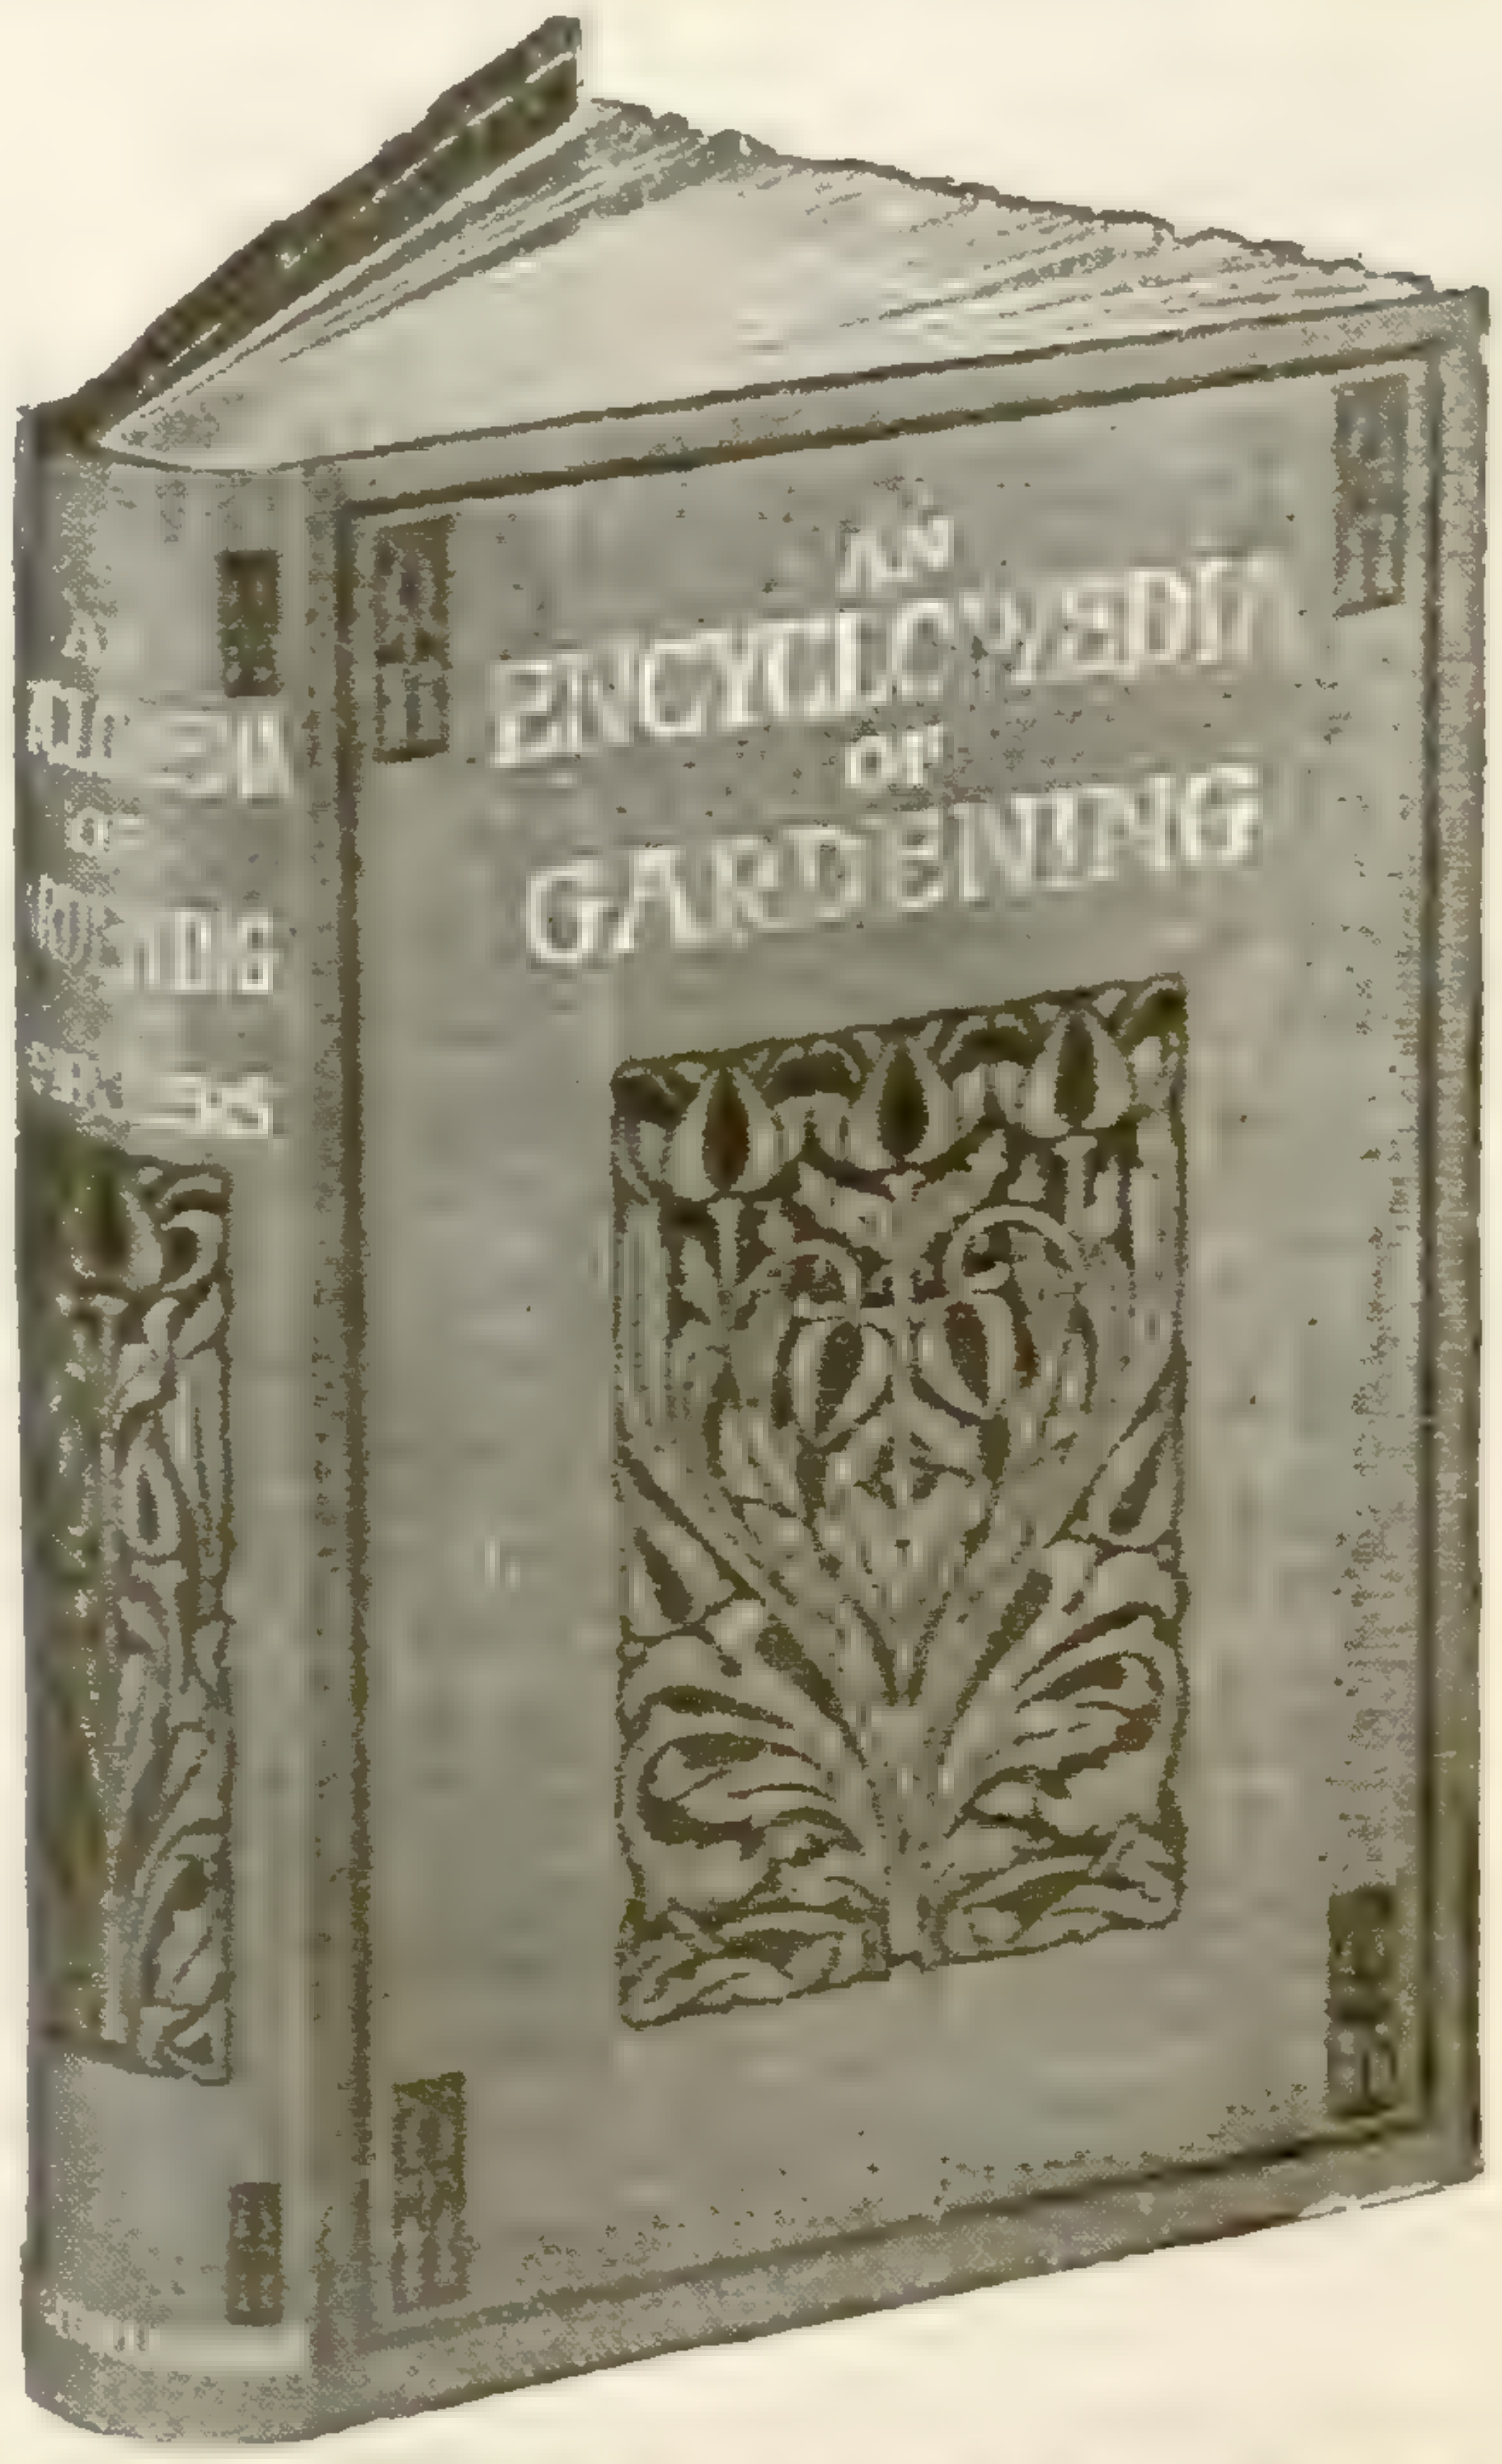
Watering.—Whether much or little moisture is required, and when; also if plants require syringing or otherwise.

Temperatures.—What artificial heat is required at various seasons for greenhouse and hothouse plants, including orchids.

Manures.—The best artificial and other manures for each genus of plants.

Common or Popular Names.—The popular or English name of every cultivated plant, etc., grown in British gardens.

Botanical Name.—The generic or scientific name.



CONTENTS.

Propagation.—How and when to propagate each genus of trees, plants, etc.

Forcing.—Temperatures and hints on forcing plants, fruits, etc.

Pruning.—The pruning of trees, shrubs, fruits, etc., concisely described.

Height.—Average height attained by each species.

Duration.—States whether the genus described are annuals, biennials, perennials, etc.

Native Country.—Gives the native habitat of each species.

Date of Introduction.—When first introduced into Great Britain.

Natural Order.—The botanic family to which each genus described belongs.

Species Cultivated.—The number of species, hybrids, or varieties in cultivation.

ORDER FORM.

deners' Chronicle" says:—

The aim of this useful book is eminently practical—to give in a small compass the principal details which an amateur is likely to want."

NOTES OF THE WEEK.

Tornadoes.

Fortunately for Great Britain it is but seldom visited by those terrific aerial vortices of which we so often hear in the United States, but that we are not quite immune from them is obvious by the havoc caused recently in Bushey Park by what was evidently nothing other than a true tornado. The cause of these phenomena appears to be but little understood. They differ essentially from ordinary gales or hurricanes by being much more restricted in area and by their even greater violence due to concentration. They occur, too, entirely without warning, sweeping across the country at a great speed, and commencing apparently by an eagle-like swoop from above, a veritable "bolt from the blue." A peculiar feature is that they usually occur during an otherwise dead calm, and in hot weather, and this fact possibly gives a clue to their genesis. We may, for instance, assume on a perfectly still day that an enormous layer of hot air is formed over the sunlit soil, and that this layer being lighter than the cooler atmosphere above, a gradual strain is set up until at some point in the upper atmosphere the heated air finds a vent and pours upwards, while simultaneously an equal body of cooler and heavier air rushes down to take its place. The result is inevitably that a vortex is produced, at first high up, producing a dense cloud by the condensation of moisture due to the cooling of the heated air, and then from this cloud the vortex as it increases in power descends until it reaches the earth, across which it whirls with irresistible force, sucking up and shattering every obstacle in its path. All the phenomena of a tornado proper point to some such cause as we have indicated. Waterspouts may be likened to small tornadoes bred by inequality of aerial tension over the surface of the sea, the results being again a spiral whirl of air within which the velocity of rotation breeds a vacuum which the sea water rushes in to fill, and is thus sucked up aloft to be distributed in showers elsewhere. In the centre of a tornado there is obviously also a vacuum formed, for it has been noticed that houses struck by one are not merely blown down, but actually exploded, doors and windows being driven outwards by the sudden expansion of contained air when the ordinary pressure is removed. It is in fact sucked out instantaneously with shattering results to the edifice. Cyclones and hurricanes differ, as we have said, from tornadoes, in their wider range, and may, indeed, be classed as mere gradations of ordinary wind, though the causes which underlie them are still mysterious. We have to imagine a vast ocean of air enveloping a globe whose surface is greatly varied, large areas of ocean alternating with land masses great and small, and these land masses varying greatly in superficial character, mountainous and flat, forest clad or desert, and so on. This globe is also constantly revolving and being alternately exposed to the sun and deprived of its light and heat. Air varies in volume, and consequently in weight according to its temperature, and the warmer it is the more water it can hold in invisible suspension as vapour. The nature of the land surface determines absorption or radiation of the solar heat and cools or warms the air accordingly. Water and land generally differ greatly in their susceptibility to heating. We see, therefore, that there are a vast number of factors at work tending to keep the air in motion by unequal warming, and in this way currents are bred which vary from gentle zephyrs to strong winds, all of which tend to restore disturbed equilibrium. Given, however, vast level plains such as the American prairies, and, as we have suggested, the absence of any local cause of disturbance permits a strain to increase, and the catastrophic tornado is the final result Outside all these terrestrial conditions, however, we have what we may term cosmic ones, solar, and electric, and these lead to colossal atmospheric disturbances which find expression in the cyclone and hurricane aforesaid and invade enormous areas of land and sea with their immeasurable aerial whirlpools, whose formation and movements we are happily enabled to some extent to measure and anticipate by means of the barometer.

MR. W. H. MORTER,

Superintendent of the Birmingham Public Parks and Gardens.

Mr. William H. Morter is one of the most genial and one of the best known of the Parks Superintendents in the Midlands. He has for several years been superintendent of the Parks and Open Spaces belonging to the city of Birmingham, and Canon Hill Park has received his special and personal attention. Mr. Morter is still a young man and, therefore well able to put abundant energy into his very large task. Spring and summer bedding are carried out on a large scale, and most successfully, as our columns have testified, at Birmingham; and enormous quantities of bulbs are planted each year, and extensive stocks of bedding plants propagated. In round figures the area under Mr. Morter's supervision runs to about 450 acres, the largest parks being Canon Hill, Victoria, Aston, Calthorpe, Adderley, Summerfield, Lightwoods, Highgate, Queen's, and Ward End, and the Rednar and Bilberry Hills. There are eight small parks and open spaces, besides those mentioned. Mr. Morter brings experience and skill to bear upon his work, and with these he combines good taste and organising ability, and an urbanity that has made him exceedingly popular in the great Midland city.

The Whitsuntide Holidays were spent in the open-air by millions of holiday folk. The earlier part of Whit Monday was dull, and in many parts of the Metropolis a little rain fell towards midday, but scarcely enough to lay the dust, while during the afternoon and evening the weather was beautiful, and altogether the day was one of the most enjoyable Whit Mondays known for many years. Kew Gardens were visited by no fewer than 85,000 people, Hampton Court had 18,374 visitors; Finsbury Park, 14,000; Clissoid Park, 12,000; Windsor Castle, 10,000; Waterlow Park, 10,000; Barnet Woods, 8,000; Highgate Woods, 3,000; Highbury Fields, 5,000; Alexandra Palace, 45,000; and Wimbledon Common and Putney Heath about 20,000. It is estimated that about half a million people visited the Franco-British Exhibition.

Lieut. - Colonel Holford.—The gentleman whose collections of orchids at Westonbirt, Tetbury, Gloucester, are the admiration of all horticulturists, was gazetted on Tuesday last as Lieut.-Colonel of the 1st Life Guards. Major, now Lieut.-Colonel G. Holford, C.V.O., C.I.E., is one of the most popular of British horticulturists, but he does not confine his attention to orchids. He has a magnificent arboretum at Westonbirt, and he has the finest amateur's collection of amaryllis in the country.

The Scottish Fruit Crop.—Our Aberdeen correspondent writes: With the advance of the warm weather Scottish fruit growers are now estimating the season's crop. Since the middle of May fruits have made rapid growth. The result is that the fruit crop promises to be an early and heavy one. The strawberry crop is looking extremely well, and a good yield is anticipated. Red currants—the best disease-resisting fruit we have—promise to be specially good, but black currants will be scarce. The latter is very subject to the black currant mite, and the loss and damage to this crop in recent years in Scotland has been so great that many growers are grubbing up their bushes of this particular fruit. Last year the crop of gooseberries in Scotland was so great that it was with the greatest difficulty a market was found for the fruit, and, from the growers' point of view, it would be a blessing in disguise if this year's crop were not so heavy. At present the prospects are that there will again be an abundance.

Poisonous Compounds for Horticultural and Agricultural Purposes.—Mr. G. H. Richards writes: The horticultural trade should now bestir themselves and approach their Members of Parliament and obtain support to Clause 2 of the Poisons and Pharmacy Bill when it reaches the House of Commons. The final issue between the Traders in Poisons Society and the chemists monopoly is fast approaching, and every effort should be made to secure a victory for fair trade. The Bill has this season passed its second reading in the House of Lords, and Clause 2, which will make it lawful for nurserymen, florists, and agricultural agents to stock and retail insecticides, weed killers, sheep dips, etc., has been recommended by a Joint Committee to go forward. It is anticipated that the Bill will reach the House of Commons, from the House of Lords, within the next few weeks, and it is most important that support for the Bill should be obtained at once by the horticultural trade by writing to their Members of Parliament, claiming support of Clause 2, as the chemists are opposing most strenuously and canvassing Members of Parliament. All information as to the way to go to work can be obtained from Mr. T. G. Dobbs, solicitor, Worcester (secretary of the Traders in Poisons Society).

French Horticulturists Visit to London.—A party of horticulturists, members of the National Horticultural Society of France, will pay a visit to London on the 22nd inst. for a week. They will visit the Franco-British Exhibition, Kew Gardens, Windsor, the leading sights of London, the parks, nurseries, etc. The party is limited to 200 persons.

Horticultural Club.—The next house dinner of the club will take place on Tuesday, June 23, 1908, at six p.m., at the Hotel Windsor. After dinner Mr. H. Hitchcock, of Victoria, Australia, has promised to lecture on "The Development of Gardening in Victoria during Recent Years."

Gardens Round Perth.—In the issues of the GARDENERS' MAGAZINE for June 27 and July 4 we shall give a fully illustrated account of some of the more noteworthy gardens in the vicinity of Perth. The gardens that will be dealt with include those of Dupplin Castle, Freelands, Moncreiffe House, Dunkeld House, Kinfauns Castle, Seggieden, Pitfour Castle, Meikleour House, Ballathie, and Murthly Castle.

A New Rose.—It is not often that we have to chronicle the appearance of a new species of rose, although garden varieties come in dozens yearly. On Tuesday last, however, Messrs. J. Veitch and Sons, exhibited a new species named Rosa Moysi, a very spiny kind, with elongated pinnate leaves that are spiny along the main rib. It is from China, and has rounded blooms of a deep rich rose-red hue, the shape and substance of the blooms being especially notable. Although as a garden plant it may not make hosts of friends, there is little doubt that its capabilities as a parent of new roses will soon be put to the test.

British Gardeners' Association Outing.—The members of the London branch of the B.G.A. will meet to-day, Saturday, June 13, at Portland Road Station, N.W., at three p.m., when Regent's Park, and the Royal Botanic Society's Gardens will be inspected under the guidance of Mr. E. F. Hawes. Members are requested to bring friends with them, whether members of the B.G.A. or not.

Ealing's Garden Suburb.—In connection with the garden suburb of about forty acres extent, formed at Ealing by a co-partnership society known as the Ealing Tenants, Lim., there were great doings on Whit Monday when the Right Hon. John Burns, M.P., President of the Local Government Board, accompanied by Mrs. Burns, paid the estate a visit for the purpose of opening the recreation ground of 4½ acres set apart for ever for the use of the tenants. In opening the ground and congratulating the tenants Mr. Burns pointed out that each season the London County Council provided 500 cricket pitches on which 25,000 matches were played, and 500 tennis courts on which no fewer than 60,000 games were played.

Orchard Pruning Competition.—The Gloucester Root, Fruit, and Grain Society instituted an orchard pruning competition a few years ago and offered prizes for the best managed orchards, with a view of improving hardy fruit culture in the county of Gloucester, especially in orchards attached to farms. Mr. G. H. Hollingworth, the County Council lecturer in horticulture, has acted as judge during the past three years, and though he has to deplore the comparatively small number of entries, he reports that the improvement shown during the three years has been most marked, and is, therefore, an encouragement to the society and the donors of special prizes. Sir William Marling, Bart., presented the prizes to the successful competitors a few days ago, in the presence of a company of influential gentlemen who are doing all they can to improve agriculture and horticulture in the county.

Exhibition of Forced Bulbs in 1909.—In connection with the special prizes for hyacinths and tulips to be competed for on Tuesday, March 9, 1909, at the Royal Horticultural Society, the Council have expressed a wish that this date might be made a general one for the exhibition of collections of forced spring bulbs, specially with a view to showing which varieties (of daffodils for instance) are best suited for forcing. The Council invite the exhibition of small collections from amateurs as well as from the trade.

Prizes for Orchids at Manchester.—For the session 1908-9 the Manchester Orchid Society has been offered some handsome prizes, open to amateur members. Messrs. Charlesworth and Co., Heaton, offer a fifty guinea cup to the amateur who makes the highest number of points with plants not previously dealt with by the society. Messrs. Sander and Co., St. Albans, offer a fifty guinea cup for cypripediums, but this has to be won three times ere it becomes the competitor's property. Messrs. Hugh Low and Co., Enfield; Mr. Z. A. Ward, Northenden; and Mr. H. J. Bromilow, Rainhill, Liverpool, all offer special prizes. Full information can be obtained from Mr. P. Weathers, White City, Manchester.

"The Botanical Magazine" for June contains illustrations and descriptions of the following interesting plants: Pandanus Houlleti, a strong growing Screw Pine that grows thickly in the southern part of the Malayan Peninsular, and was first introduced in 1865, and flowered at the Jardin des Plantes in 1868; Rhododendron micranthum, a small growing Chinese species with creamy-white flowers borne in racemes; Bulbophyllum Fascinator, a curious species collected by Micholitz in Annan, with crimson and green flowers; Chirita barbata, a gesneraceous stove plant, that is treated as a biennial at Kew; and Genista glabrescens, an alpine shrub from the Lake Como district, quite hardy, and yellow flowered.

Honour to M. P. de Vilmorin.—We are pleased to observe that the well-known French horticulturist, M. Ph. de Vilmorin, who has many friends here in England, has just been honoured with the cross of Chevalier of the Legion of Honour. Ever since the death of the late M. Henri de Vilmorin, M. Philippe has everywhere endeavoured to fill the gap created by the sudden death of his much-respected father.

The International Botanical Congress to be held in Brussels during 1910 promises to be a big affair. Baron de Moreau has been appointed president of the Organising Committee, with Dr. E. Wildman as general secretary. The congress will be sectionalised, the various committees dealing with particular subjects.

The Pollination of the Olive. It appears that no one has very closely observed the method by which the olive is pollinated. Professor Cockerell, of the Colorado University, writing to "Nature," says: As Knuth's great work on flower pollination, compiled from all available sources, says nothing whatever about the olive, I recently asked Professor J. E. Coit, of Arizona, to look out for insects upon the flowers. He carefully examined many olive trees in flower at Tucson, and did not find a single insect at the flowers, with the exception of a thrips (apparently Euthrips occidentalis, Pergande), which occurred in great numbers. He kindly sent me some twigs with the euthrips upon them, and I was able to observe that these insects were profusely dusted with pollen. No bees were seen at all. Professor Coit adds: "Olive pollen is formed and shed in such enormous quantities that I think the wind among the branches is the chief agent in pollination. If you jar a large branch of olive while it is in full bloom, a perfect cloud of green pollen will be seen to float away on the breeze." Arizona, however, is not the original home of the olive, and the purpose of this note is to suggest that those who have an opportunity to see the plant in bloom in Mediterranean and other countries should make some observations.

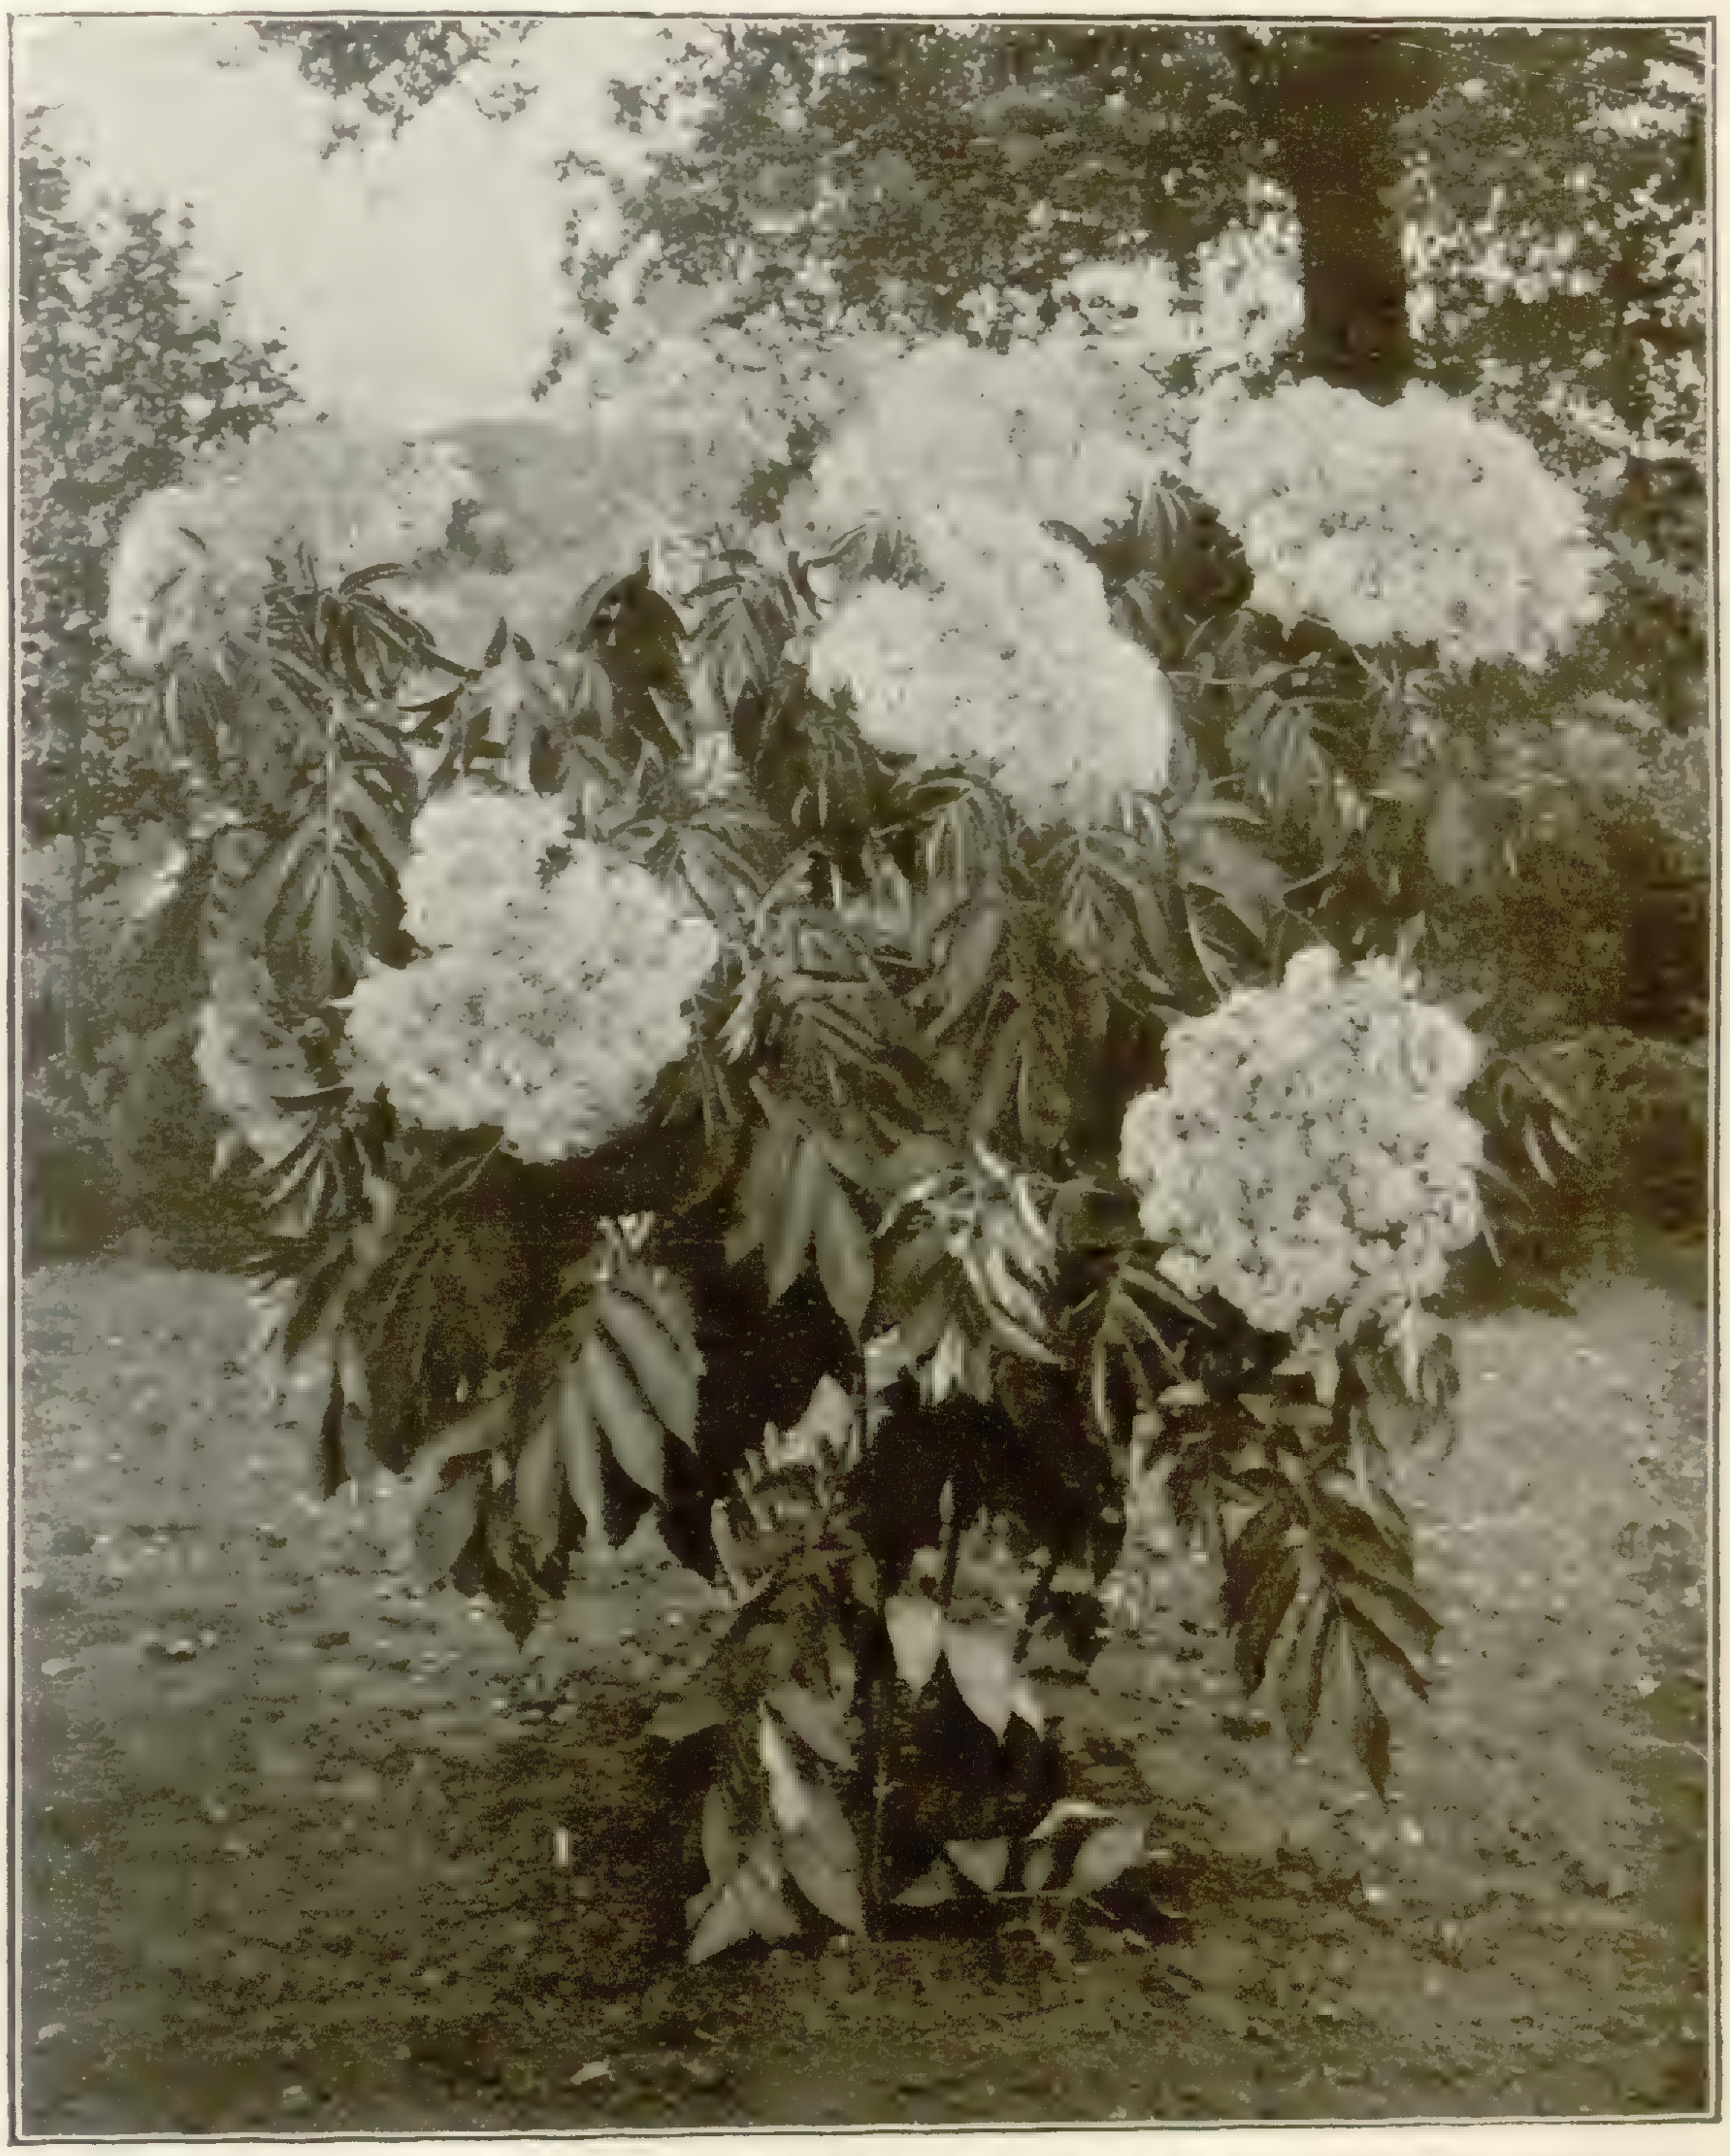
Nitrate of Soda and Sugar Production.—One result of the manurial experiments conducted on sugar plantations in the West Indies is the discovery that nitrate of soda gives a larger yield of sugar than the more popular sulphate of ammonia. Another and even more important discovery, though one that was fully anticipated, is that one of the newly-raised varieties of sugar-cane has yielded 2,000lbs. more saccharose per acre than the commonly grown White Transparent variety.

Enemies of Fruit. — At the monthly meeting of the Farmers' Club, Mr. E. S. Salmon, F.L.S., gave a lecture on the fungoid diseases with which fruit growers for market and home supplies have to contend. The lecturer said the subject of fruit growing was so wide in its scope that he found it necessary to confine his lecture to the fungi injurious to fruit trees, which, in so many instances, inflicted heavy losses upon growers. Mr. Salmon then proceeded, with the aid of lantern slides, to describe the "black spot" or "scab" in apples and pears, "brown rot" in cherries, plums, apples, and pears, and "cherry-leaf scorch" in cherries. Following his description he gave particulars of the measures that in his opinion should be taken to ward off the attacks of the diseases and prevent their spread should they make an attack. Spraying the trees with Bordeaux mixture was, he said, the most inexpensive and efficient remedy, and instances were quoted of the benefit that had accrued from its use. Every fruit grower was urged to carry out systematic spraying operations regularly, but, in order to eradicate the various diseases, co-operation amongst growers and legislative assistance from the State were both urgently needed. In Mr Salmon's opinion there should be a special sub-department created at the Board of Agriculture to deal with all matters connected with the fruit-growing industry. When once fungoid and insect pests had been eradicated, it lay with the growers themselves to adopt methods of grading, packing, and marketing their fruit in order to compete with equality with those countries from which the fruit supply was mainly drawn at the present time. In the discussion, Mr. W. W. Berry cordially supported the suggestion that a special sub-department for the fruit industry should be formed at the Board of Agriculture, and he emphasised the importance of the most careful attention being paid to grading, packing, and marketing. Mr. W. G. Lobjoit directed attention to the importance of good cultivation as a means of keeping fruit trees free from diseases of fungoid origin: and he expressed the hope that scientific men had not said the last word to fruit growers when they spoke of spraying, which he regarded as an expensive process.

New Park for Aberdeen.—Active steps are being taken by a number of leading citizens of Aberdeen to urge on the City Council the advisability of establishing a park in the west end of Aberdeen, and the movement is being followed with much enthusiasm in the districts more immediately concerned. A remit on the subject is at present under the consideration of the Links and Parks Committee of the Town Council. The proposal is to acquire from the City of Aberdeen Land Association ground at the Rubislaw Beachfield, extending to about 25 acres. The terms offered by the association are regarded as exceedingly favourable. The stipulation is that not less than 15 acres must be acquired at £400 per acre. The ground is delightfully situated, is supplied with an abundance of running water, and could at comparatively little cost be made suitable in every way for the purpose of a park.

SAMBUCUS CANADENSIS VAR. MAXIMA.

The accompanying illustration gives a good idea of this plant when growing under satisfactory conditions. Its principal attractions are its handsome foliage and enormous inflorescences, which quite eclipse in size, not only those of the type, but those of all other hardy elderberries also. The species is a native of North America, where it is known as the Canadian elder. It has been in cultivation for about 150 years, but it is only within recent years that the variety under notice has become generally known. As will be seen in the picture, the pinnate leaves are large, and usually composed of from nine to eleven leaflets. The flowers are white, and produced in enormous inflorescences, often a foot or more across. The blossoming period is later than that of most elderberries, the blossoms being at their best during July and August.



SAMBUCUS CANADENSIS MAXIMA.
In the Coombe Wood Nurseries.

The common golden elder of gardens, though often included under Sambucus nigra, appears to correspond much more closely with the Canadian plant. Like other elders, the one under notice thrives most successfully in good loamy soil, in a rather moist situation, where it is shaded from the full glare of the sun.

W. Dallimore.

ROSE MARECHAL NIEL UNDER GLASS.

Those who have never seen the Maréchal Niel growing under the best conditions can hardly be aware of the possibilities of this splendid rose. It is, of course, the most favourite variety with all who try to cultivate roses for cut bloom under glass, although with some the Niphetos is equally popular. But it would be safe to assert that the Maréchal Niel has never yet been surpassed as an all-round rose for greenhouse culture, and it is very doubtful if there is another which can really be said to equal it. In the hands of many people, however, the Maréchal Niel is by no means so great a success as it should be, simply because its requirements are not properly understood.

This rose is not really fastidious in its tastes, but it must have one or two things to make it thrive. The most important of these is depth of soil, and the next plenty of room for its branches. Those who cannot supply these two essential requirements should not attempt to grow under glass a rose that is so free in habit as the Maréchal Niel. There are many others which are better suited to confined spaces, and it is much better to have one of them, even if not quite so good, rather than court failure and disappointment by attempting things that are beyond one's facilities.

For Maréchal Niel cultivation any ordinary greenhouse will suffice if it be roomy and not crowded with a host of other things. It need not be of any particular dimensions, but the longer that it is in proportion to its width the better. The border may be inside or out so long as it is not occupied with plants which will interfere in any way with the treatment of the roses. Most people want to make the best of the inside space at their disposal, and the outside border is, perhaps, therefore the best. A span-roofed house is much the most suitable, but a lean-to will do if the roses are planted, as in the span-roof house, so that they can be trained near the glass and not against the wall. In the latter position they seldom do so well, and it is difficult to provide them with all the light and air that they need. A span-roof greenhouse should run north and south, and a lean-to east and west, especially for rose-growing, although, of course, fairly satisfactory results can be obtained with other aspects.

It is quite possible to grow other things in conjunction with roses—tomatoes in the summer, for instance, and chrysanthemums in the winter—but the best success will be attained by those who are able to devote their house entirely to the roses. Some people grow ferns and arum lilies, or some such moisture-loving things, under their roses, but the practice is not to be recommended for several reasons. It is impossible under such conditions to give the trees the periodical rest that they require; and secondly, the state of the atmosphere is difficult to regulate so that it may be suitable to each kind of plant. There is nothing more easily spoilt than a good crop of roses, and the question of temperature and atmosphere are very important when the trees are coming into bloom.

A rose border need not necessarily consist of clay, either wholly or in part, as so many people seem to imagine, a good fibrous loam being quite satisfactory for the purpose. If a little red clay can be procured it will help to give substance to a light soil and the roses will benefit thereby, but they will thrive perfectly well without it if the soil employed is already compact and firm. Previous to making up the bed, which must be not less than eighteen inches in depth, and preferably deeper, the subsoil should be roughly broken up to the depth of a foot or so, and suitable drainage provided. This is best supplied by laying down a quantity of old brickbats, large stones, or clinkers from the furnace. Upon these the soil can be laid, placing the roughest of it underneath, and filling up with the loam and some old rotten cow manure in the proportion of five to one.

The trees should then be planted at the same depth as when they were growing in their previous quarters, and the soil rammed firmly round them. In the case of a house of very wide span the trees can be set much closer than in a narrow one, because in the former case the long shoots can be trained straight up the roof to the apex instead of towards each end of the house. It is a good plan to have wires fixed in both directions, so that in order to economise space and fill the roof with strong young wood the shoots can be trained either way as occasion requires. The wires should not be fixed direct to the rafters, but to supports which project from the glass to a distance of six or eight inches.

In purchasing Maréchal Niels one should be very careful to select only those which show signs of active growth, for stunted and pot-bound trees will not be satisfactory, and these are a bad bargain at a gift. Once planted, attention to temperature, ventilation, watering, and pruning covers the chief points of cultivation. Placed in their permanent quarters, the trees should not be allowed to put out growth of any consequence till early in the following year, and if all artificial heat can be dispensed with till then so much the better. The thermometer, with fire heat only, should not rise beyond 60 degrees Fahr. at first, or above 70 degrees later on.

As soon as the young dark-coloured growth begins and the spring sunshine raises the temperature of the house, the fire must be damped down during the middle of the day, and a light shading of tiffany provided on bright days. Plenty of air must be given whenever the outside temperature is not too low, but direct draughts must be avoided, or mildew—the most troublesome of rose ailments—will surely make its appearance. If this occurs remove the affected parts and paint the pipes with a sulphur wash towards evening once or twice a week, but prevention is better than cure, and mildew is a difficult thing to get rid of once it has established itself.

Watering, whenever needed, must be done with tepid water, and the roots should be mulched with rough manure during the summer. Syringing is a most important operation, and must be carried out assiduously in the early morning and again at night from the moment that the sap begins to rise. Water of the same temperature as that of the house itself must be used, and if the work is carried out regularly, blight should give no trouble. When the colour of the first blossoms begins to show syringing may be discontinued and a drier temperature maintained, with plenty of air. No pruning will be required beyond the removal of superfluous or weakly shoots until the trees have bloomed, when the flowering stems should be cut back to within a couple of eyes of the main rods. The latter must not be shortened except when it is absolutely necessary for want of space, and they will sometimes extend to the length of 20ft. or 30ft. in the course of a season or two.

Marked evidence of falling off in powers of blossoming should be the signal for the removal of a main rod, but if the tree is in good health there will very soon be another to take its place. One should also have in reserve a few plants to replace those which show any signs of canker, to which dread malady nearly every Maréchal Niel that ever grew has fallen a victim sooner or later. But disease is not much to be feared so long as the trees are kept growing by proper treatment and sufficient feeding from the surface, and if the foregoing directions are carried out no one should have much difficulty in securing a profusion of bloom from February to April every year.

F. B.

SUMMER TREATMENT OF STOVE AND GREENHOUSE PLANTS.

A large number of plants thriving in the conservatory and greenhouse benefit very considerably by living an out-of-door life from the middle of June until the end of September, and nothing but good can accrue from it, provided they are placed in suitable positions. We have distinct proof that it tends to the longevity and general all round improvement of plants. The growth made in the open is robust and hard, which fits them to undergo and withstand the adverse conditions of the dull season.

Many amateurs possess tree ferns, large palms, and musas, and a secluded, sheltered and somewhat shady spot should be found for them. Direct sunshine affects palms by turning the leaves a dull yellow, and while in some instances they revert to their original colour when shaded, it is not advisable to render them unhappy. Great care must be exercised in the selection of a site for the tree ferns, somewhere between belts of shrubbery, which will effectually break the force of winds and south-western gales; and, further, the plants must be securely guyed or fastened to prevent them being blown over. It is hardly necessary to say that due attention must be paid to watering, not forgetting that evaporation is much more rapid in the open than under glass. The stems, too, must be well syringed once a day at least, and in very hot weather, morning and evening. Many ferns of comparatively small growth, too, find a place underneath them, such as Asplenium bulbiferum, a large number of the pterises, the Elk's Horn fern, and many others, and I have seen them utilised to render the hardy fernery still more pleasing and attractive, the pots being plunged to the rim.

Eucharises are usually given a rest of three or four months after flowering, and full exposure to the sun will strengthen them considerably, and the same applies to clerodendrons and stephanotis after the growth is completed, thoroughly matured and ripened wood being the result. The Indian azaleas, vallotas, ericas, camellias and oleanders should have a position of doors for some time, and last-named utilised in the decorative portion of the garden, as they profusely in a sun-bathed situation. Further, many orchids revel in the during the period mentioned, and some species of oncidiums, vandas, dendrobiums and lælias may be arranged suspended the summer house or trees of thin growth, such as laburnums, etc.

WALTER H. AGGETT.

HARDY PRIMULAS—No. I.

Hardy primulas are a generous race of plants, for the most part neat and orderly in growth. They consist of many species, with several varieties of distinguished merit that collectively form one of the brightest groups of plants that we can employ for furnishing borders or rock gardens, and in some instances they are singularly at home on the margins of lake and stream, or in the swampy marsh.

It is worthy of passing notice that five species of primulas are indigenous to Britain; our earliest recollections are indelibly associated with the primrose of childhood, and though wider knowledge teaches us that other lands yield species to an extent we little dreamt of, our reverence for the humble harbinger of spring still remains. To the wild primroses we are indebted for that floral wealth which adorns our gardens in spring with the highly-developed forms of primrose and polyanthus, and which are now indispensable in all well-conceived spring gardening; and what conscious pride we exhibit when pointing to P. farinosa as a genuine native, whose dainty form and bewitching flowers are in no way inferior to those Chinese and Himalayan kinds.

Primulas have a wide geographical distribution, scattered representatives occur in North and South America, but their central headquarters in the East appears to be the Himalayas, passing into China. From this latter country, P. Cockburniana, with its fiery orange flowers, has but recently been given us, and it has already exercised a potent influence in cross-fertilisation which augurs well for the continued interest and prosperity of the genus.

Outside the Asiatic species those common to Europe occupy the position of greatest prominence in rock gardens, as it is scarcely possible to accommodate such a dwarf as P. minima unless some special provision is made for it, and in like manner P. Allioni is a continual source of disappointment unless we comply with the exacting nature of the plant, insisting as it does upon root moisture in abundance, yet abhorring water upon the leaves. These are extreme instances which can scarcely be accepted as typical of the genus, for the cultural requirements of the majority of primulas are simple in the extreme. Briefly, they require rich soil, largely composed of humus and having plenty of grit added, which ensures perfect drainage and a cool rooting medium, for, although delighting in abundant supplies of moisture in summer, most of the rock species are impatient of saturated conditions in winter, and I have frequently observed the crowns of P. japonica rot out before spring when planted in too close proximity to water, yet they invariably winter safely when the crowns are well above the water level, though the roots may be largely submerged.

Bogs and marshy ground form ideal positions for such species as P. denticulata, P. japonica, P. Sieboldi, P. sikkimensis, and P. rosea, and under such conditions, and where the surroundings prove acceptable, they often colonise themselves from self-sown seed. These are all Asiatics of unquestioned beauty. P. denticulata is the earliest to flower, and produces closely packed globular heads of flowers, carried on 15in. stems; P. Cashmeriana is a splendid form, having deeply crinkled leaves which are densely covered with a yellow powder on the under side of the leaves, the flowers are bright lilac, several shades clearer than in the type. There is also an albino form which is strikingly effective in a colony.

Closely related to P. denticulata is a fine violet primula named P. capitata. It closely resembles P. denticulata in the form and build of the flower, though it appears to prefer the driest part when grown in a bog, and it is valuable on account of flowering in late summer. Primula rosea is the brightest jewel in the bog in spring, the clear rosy-red flowers impart a charming and refreshing patch of colour which is welcome at this season; try as you like you cannot resist the charm of this pure colour, and can only wonder how such a lovely thing comes to grace our gardens and endure our climate in spring; yet travellers tell us how these fragile stems burst up from the snow and ice on the Himalayas and greet the earliest spring days with that luminous colour which, seen under conditions such as these, must be greatly intensified. However, P. rosea grows strongly and increases, and is quite one of the easiest to deal with, sending up sheaves of its lovely flowers every year during March and April.

Walmsgate. **Thomas Smith.**

CHRYSANTHEMUM ULIGINOSUM.

As Pyrethrum uliginosum this chrysanthemum has long been known as a useful border plant. Nor has the change of appelation affected its good qualities, for, all things considered, there is not a better or showier subject in the herbaceous border in September and October.

Not one whit particular where or in what it is planted, this good old perennial thrives in town as in country, in sand as in clay, though it prefers a medium loam to either. The single plant of this autumn may well be a dozen plants next flowering season, for every lead, every flowering stem, will make a good plant in a single year if at all liberally treated.

A rough and ready way of increase is to chop an old plant up with a spade, but this is inartistic and bordering on unkindness to so good a servant. Far better pull it carefully to pieces with the hands, reject weak or sickly central growths, and plant the strong outside ones nine inches to one foot apart in a large clump. If the site is double dug and some manure finds its way between the upper and lower spits then the appearance of that clump in autumn will be a revelation.

From such newly-formed clumps one may cut sprays of flowers four feet or five feet long, the flowers large as crown pieces, and of the purest white. For church decoration, harvest festivals, etc., it has no rival as a cut flower, a few fronds of dead bracken, a few boughs of early yellowing beech, and, above all, some nicely coloured sprays of Virginian creeper, completing an arrangement as effective as it is easily arranged. Plants may be bought and put in at any time up till March.

E. J. K.

CHRYSANTHEMUM ULIGINOSUM.

A handsome late-flowering hardy perennial of tall growth and bearing pure white flowers.

APPLE FRENCH CRAB.

With reference to the remarks made by Messrs. W. Seabrook and Sons, relating to the above apple (page 403), I fear they have not read up Dr. Hogg on Northern Greening, for if their apple is the same as ours it is not Northern Greening at all, but Winter Greening—(French Crab, of Hogg's "Fruit Manual," fifth edition, page 244). Any novice may recognise Northern Greening by the fleshy swelling on one side of the stalk (see "Fruit Manual.") I send you fruits from our tree, but they are only half their usual size owing to the cold, dull season here. I trust your correspondents will also send you fruits for comparison.

Straffan. **Fredk. Bedford.**

THE PRIVATE GARDENER.

We found ourselves reading the following essay with such great interest that we feel sure, while it was written for American gardeners, it cannot fail to interest and help our British readers. It is from the pen of Mr. Robert Craig, one of the foremost of America's horticulturists, and it was read by him before the Massachusetts Horticultural Society in February of the present year:—

I choose the subject because I conceive that it is one of more importance than is generally assigned to it, and that the private gardener is likely to play a part of continually growing importance in American life. His influence on the future of horticulture is powerful for good or for evil. If he be a capable, energetic, and honest man, he will do such work as will make his employer a patron of gardening, and if he be ignorant, careless, and dishonest he will not only ruin himself, but will damage the cause he misrepresents. Allow me to recite a couple of instances occurring in my own neighbourhood which illustrate this point:—

Success Stimulates Interest.

I was well acquainted with a wealthy gentleman who built new greenhouses and started to improve the grounds surrounding his fine mansion. He was fortunate in securing a fine English gardener, newly arrived in this country; his place rapidly improved under the new gardener's care, and after two years' work, when the owner saw he was getting good results, he became greatly interested, and invested freely large sums to carry on the improvements. Everything prospered and was a source of great pleasure to the owner and his friends, when suddenly the good gardener was stricken with an incurable disease and had to give up work. The place was then put in charge of his first assistant, a young man about 26 years old, who was given a fine opportunity to make a name for himself, but he could not stand even a little prosperity! and, during a spree, an accident to the boilers resulted in the entire stock of plants being frozen. The owner, who had plenty of money to spend in gratifying his tastes, lost all interest in gardening, and became a liberal patron of other fine arts. His collection of paintings and sculpture are known far and wide, but the greenhouses are empty, the garden neglected, and it is not likely the owner's interest in these will ever be revived.

Another instance coming under my immediate observation interested me still more. One of the wealthiest men in the neighbourhood of Philadelphia built one of the finest mansions in the State, employed the highest talent in landscape gardening, and in a couple of years had the new place greatly improved. He employed a young German gardener who had previously, at a salary of only 60 dollars per month, made a good name for himself, gave him entire charge, and he worked with such intelligence, industry, and honesty, that the employer built for him additional ranges of glass at a cost of 50,000 dollars, and allows him to spend annually a large sum in improving the place. Only last summer he took a trip to Europe at his employer's expense, with power to purchase such rare plants as he might select. His salary is now quite satisfactory to him. Oh, but you say, this was a rare case. Perhaps it was, but I am sure at the rate wealth is increasing in this country the number of such places will steadily increase. I like to quote Lord Bacon on this point: "When ages grow to civility and elegancy men come to build stately, sooner than to garden finely, as if gardening were the greater perfection."

The Gardener's Education.

The problem of how a gardener should set about preparing himself for his life work is, in this country, a serious one. In the older countries of Europe, opportunities to acquire a thorough knowledge of all departments are plentiful. There are so many estates on which the grounds are admirably planned and planted, and where there are numerous houses adapted for propagating and growing everything for the garden, that a man may get a thorough knowledge of gardening in all branches; and there are many commercial places which carry on all lines and where boys may go and learn the business as they grow to manhood. There are only a few such commercial places in America. In this country almost all the trade establishments cultivate specialities, as roses, carnations, or palms. Nearly all of our good, all-round gardeners get their training abroad, and it is well for any young man who can get a chance to learn gardening under such a man, either on a large private place or in a park.

Some of our colleges now have facilities for teaching gardening. I wish that all of the colleges would follow the example of Cornell, where they have six greenhouses, in which students may gain a practical knowledge of plant growth, learn how to prepare soil and manure, and have opportunity to gain a general knowledge of advanced gardening. Many of the colleges have now a course in forestry, and I understand that young men getting diplomas, if otherwise fitted, can readily procure employment at fair salaries. It seems to me that the time is now ripe for all the leading colleges to build ranges of glass and have courses in practical horticulture. Graduates from these classes would have an advantage over uneducated men in securing the best positions. The recent establishment of classes in landscape gardening by the Florists' Club of Boston is of great value to those near enough to take advantage, and is an example for all similar institutions everywhere to imitate.

Be a Reader.

To the gardener who wants to improve himself, books are a paramount necessity. Nicholson's "Dictionary of Gardening" and Bailey's "Cyclopedia of American Horticulture" should be in the possession of every gardener; they describe nearly every plant in cultivation, and their cultural notes are of great value. I will not attempt naming all the good books, but cannot refrain from mentioning Jenkin's "Art of Propagation and Improvement of Cultivated Plants"; Taft's "Greenhouse Construction"; Hunt's "How to Grow Cut Flowers"; Henderson's "Practical Floriculture"; Falconer's "Mushrooms"; Ellwanger and Reynolds Hole on "Roses"; "Downing's "Fruits and Fruit Trees"; Peter Henderson's "Gardening for Profit"; Mrs. Van Rensselaer's "Art Out of Doors"; "The Principles of the Harmony and Contrast of Colours," by M. E. Chevreul; Herrington and Smith on "Chystanthemums."

Cultivate a love for books; it is a habit that grows by indulgence. Subscribe for one or more of the trade papers, and get your names on the lists of the agricultural stations, so as to get up-to-date information, the results of the latest experiments along all lines. The seedsmen's catalogues are great educational factors; I know of no greater improvement horticulturally than in the character and contents of these valuable publications.

Every garden may be made more interesting by excelling in some speciality. Every gardener should have a hobby. By saving your own seed, carefully selecting, year after year, the finest, it is astonishing how you can improve the varieties in any species. You will find in a few years your constant and careful pursuit of your hobby will result in making you, and the place you represent, more or less famous. As Emerson says, "If you make shoes better than anyone else you will have a path beaten to your cottage door."

How New Varieties Come.

It is profoundly interesting to study how new varieties come. Nature works, often we know not how, in bringing new varieties. The influence of heredity undoubtedly prevails to some extent, and instances are not wanting to show that it does. Let me give you just one in own experience. Three years ago we made a number of crosses in carnations, using Harlowarden as one of the parents. You will recollect that this sort had a long, desirable stem, and we noticed about one-fifth of these seedlings had Harlowarden stem, but there were teristics developed in a number of lings which had no visible connection either of the parents. Sometimes, ever, the influence of both parents can distinctly traced. Many of you will lect the introduction of the Daybreak nation, a charming variety which had many stems, but these were long and stiff and every shoot produced a flower. the same time was introduced Tidal Wave which produced many stems, but lacking in length. The crossing of these varieties produced the famous Lawson which inherited the good points of varieties. Among the seedlings with son blood has been found Enchantress, which I think has more good qualities than any other variety, and following along this line has resulted in producing a free blooming, vigorous type, which made Mr. Fisher famous.

The results of Mr. Walsh's work roses of the Wichuraiana type are little short of marvellous; the man who does such things is a public benefactor.

But, while man can do something in breeding from types, Nature is always at work and often produces, we know how, valuable breaks in seedlings sports, which are frequently lost because the gardener fails to recognise merits, and propagate and perpetuate them. Private gardeners have done much in the past to preserve and propagate good new things, and should be ever the alert to take advantage of any tunities along this line which kind Nature may afford.

Importance of Vegetables.

One of the main branches of work the private gardener is the growing vegetables. There should be an abundance of vegetables for spring, summer and fall, and where the facilities for their culture, in winter also. dinner is complete without fresh tables, and many of the finest, most cious and delicately flavoured, cannot purchased in the markets, because do not pay to grow commercially. If can furnish your employer a regular ply of these dainties, you will find self in close touch with him, and likely to help you in any of your plans.

Industry and Courage.

Now, a few words on the importance industry. From the earliest times, great men have extolled the value of dustry. "Go to the ant, thou slug- consider her ways, and be wise," served for the text of many a power sermon. The expression that "ge only an infinite capacity for work" been endorsed by many thinkers. N leon said: "I have never found the of my capacity for work." In short men who have made their mark world have been at a loss for wo express themselves strongly enough the subject. Don't be afraid of work don't forget that "folks who nev more than they are paid for, nev paid for more than they do." Let amount of pay be your main con- tion; rather see how much and how you can do the work. The real [illegible] holds out for work is the increased capacity to do more and better work, and consequently greater satisfaction and enjoyment. The man who wants an easy life is not fitted for a gardener. Many good men fail to do their best for want of courage and faith in themselves, and from lack of energy and ambition; there are not so many failures from want of capacity. Herrick says: "The great man is not so great as folks think, nor the dull man so stupid as he seems."

The late Peter Henderson, a great gardener, close observer, and successful business man, often said that he did not think there was so much difference in the mental capacity of men as in their energy, ambition, and industry. Have faith in yourselves and loyalty to your employer. I am fond of the saying of Fra Elbertus: "If put to the point, an ounce of loyalty is worth a pound of cleverness." Don't be afraid to undertake all the time bigger things; your ability will grow in your earnest attempts to accomplish; and don't be afraid of manual labour if occasion require; it will not lessen, but increase your mental power. A stiffening and strengthening of the spinal column begets no weakness in the mind: "A sound mind in a sound body." The advantage of outdoor exercise is recognised everywhere. The orator in the English Parliament exclaimed: "The battlefields of England were won on the cricket fields of Eton," and there was much force in the rejoinder of the Irish member: "They were won on the bogs of Ireland."

Compensation for Gardeners.

The problem of compensation for gardeners is an interesting one. Most gardeners think it is a poorly-paid work, and perhaps it is, considering how much has to be learned. I think, however, the money reward rests largely with the individual. There can be nothing like a uniform scale of wages. I had, for instance, paid my foreman about 1,200 dollars a year, but I must say that one to whom I paid 2,000 dollars per annum was the most profitable one to me.

I think, on the whole, the outlook for first-class gardeners is good. Never in the history of nations has wealth increased so fast as in the United States during the last quarter of a century, and a majority of the wealthy men will, in the future, I venture to say, find their highest pleasure in developing their gardens and country estates. Gardening is the most healthful of all occupations; it is one of the fine arts. Ruskin has defined fine art as any occupation in which the head, hand and heart work together. I cannot see why the gardener cannot take as much pleasure as the owner. "He who admires is the real possessor." "There is no ancient gentlemen, but gardeners."

"Let fools their gold and knaves their
  power,
Let fortune's bubble rise and fall;
Who sows a field, or trains a flower,
Or plants a tree, is more than all."

Hedera dentata variegata.—Last year at Holland Park Show an Award of Merit was given to this beautiful variety of the well-known large-leaved Hedera dentata. It has the handsome foliage of the typical kind, but, instead of the uniform rich green of the ordinary form, the leaves are very freely variegated with white. As it is of free growth with ample leafage, this ivy should ere long become very popular. Much as ivies are grown, we scarcely recognise to the full their various possibilities, for, apart from their value for covering walls, pillars, stumps of old trees, etc., they form admirable screen plants if grown in large pots or tubs and trained on a trellis. Ivies grown in this way may be employed as screens in cold, draughty corridors, and for similar positions where more tender subjects would be liable to injury.—W. T.

CROCUS MALYI.

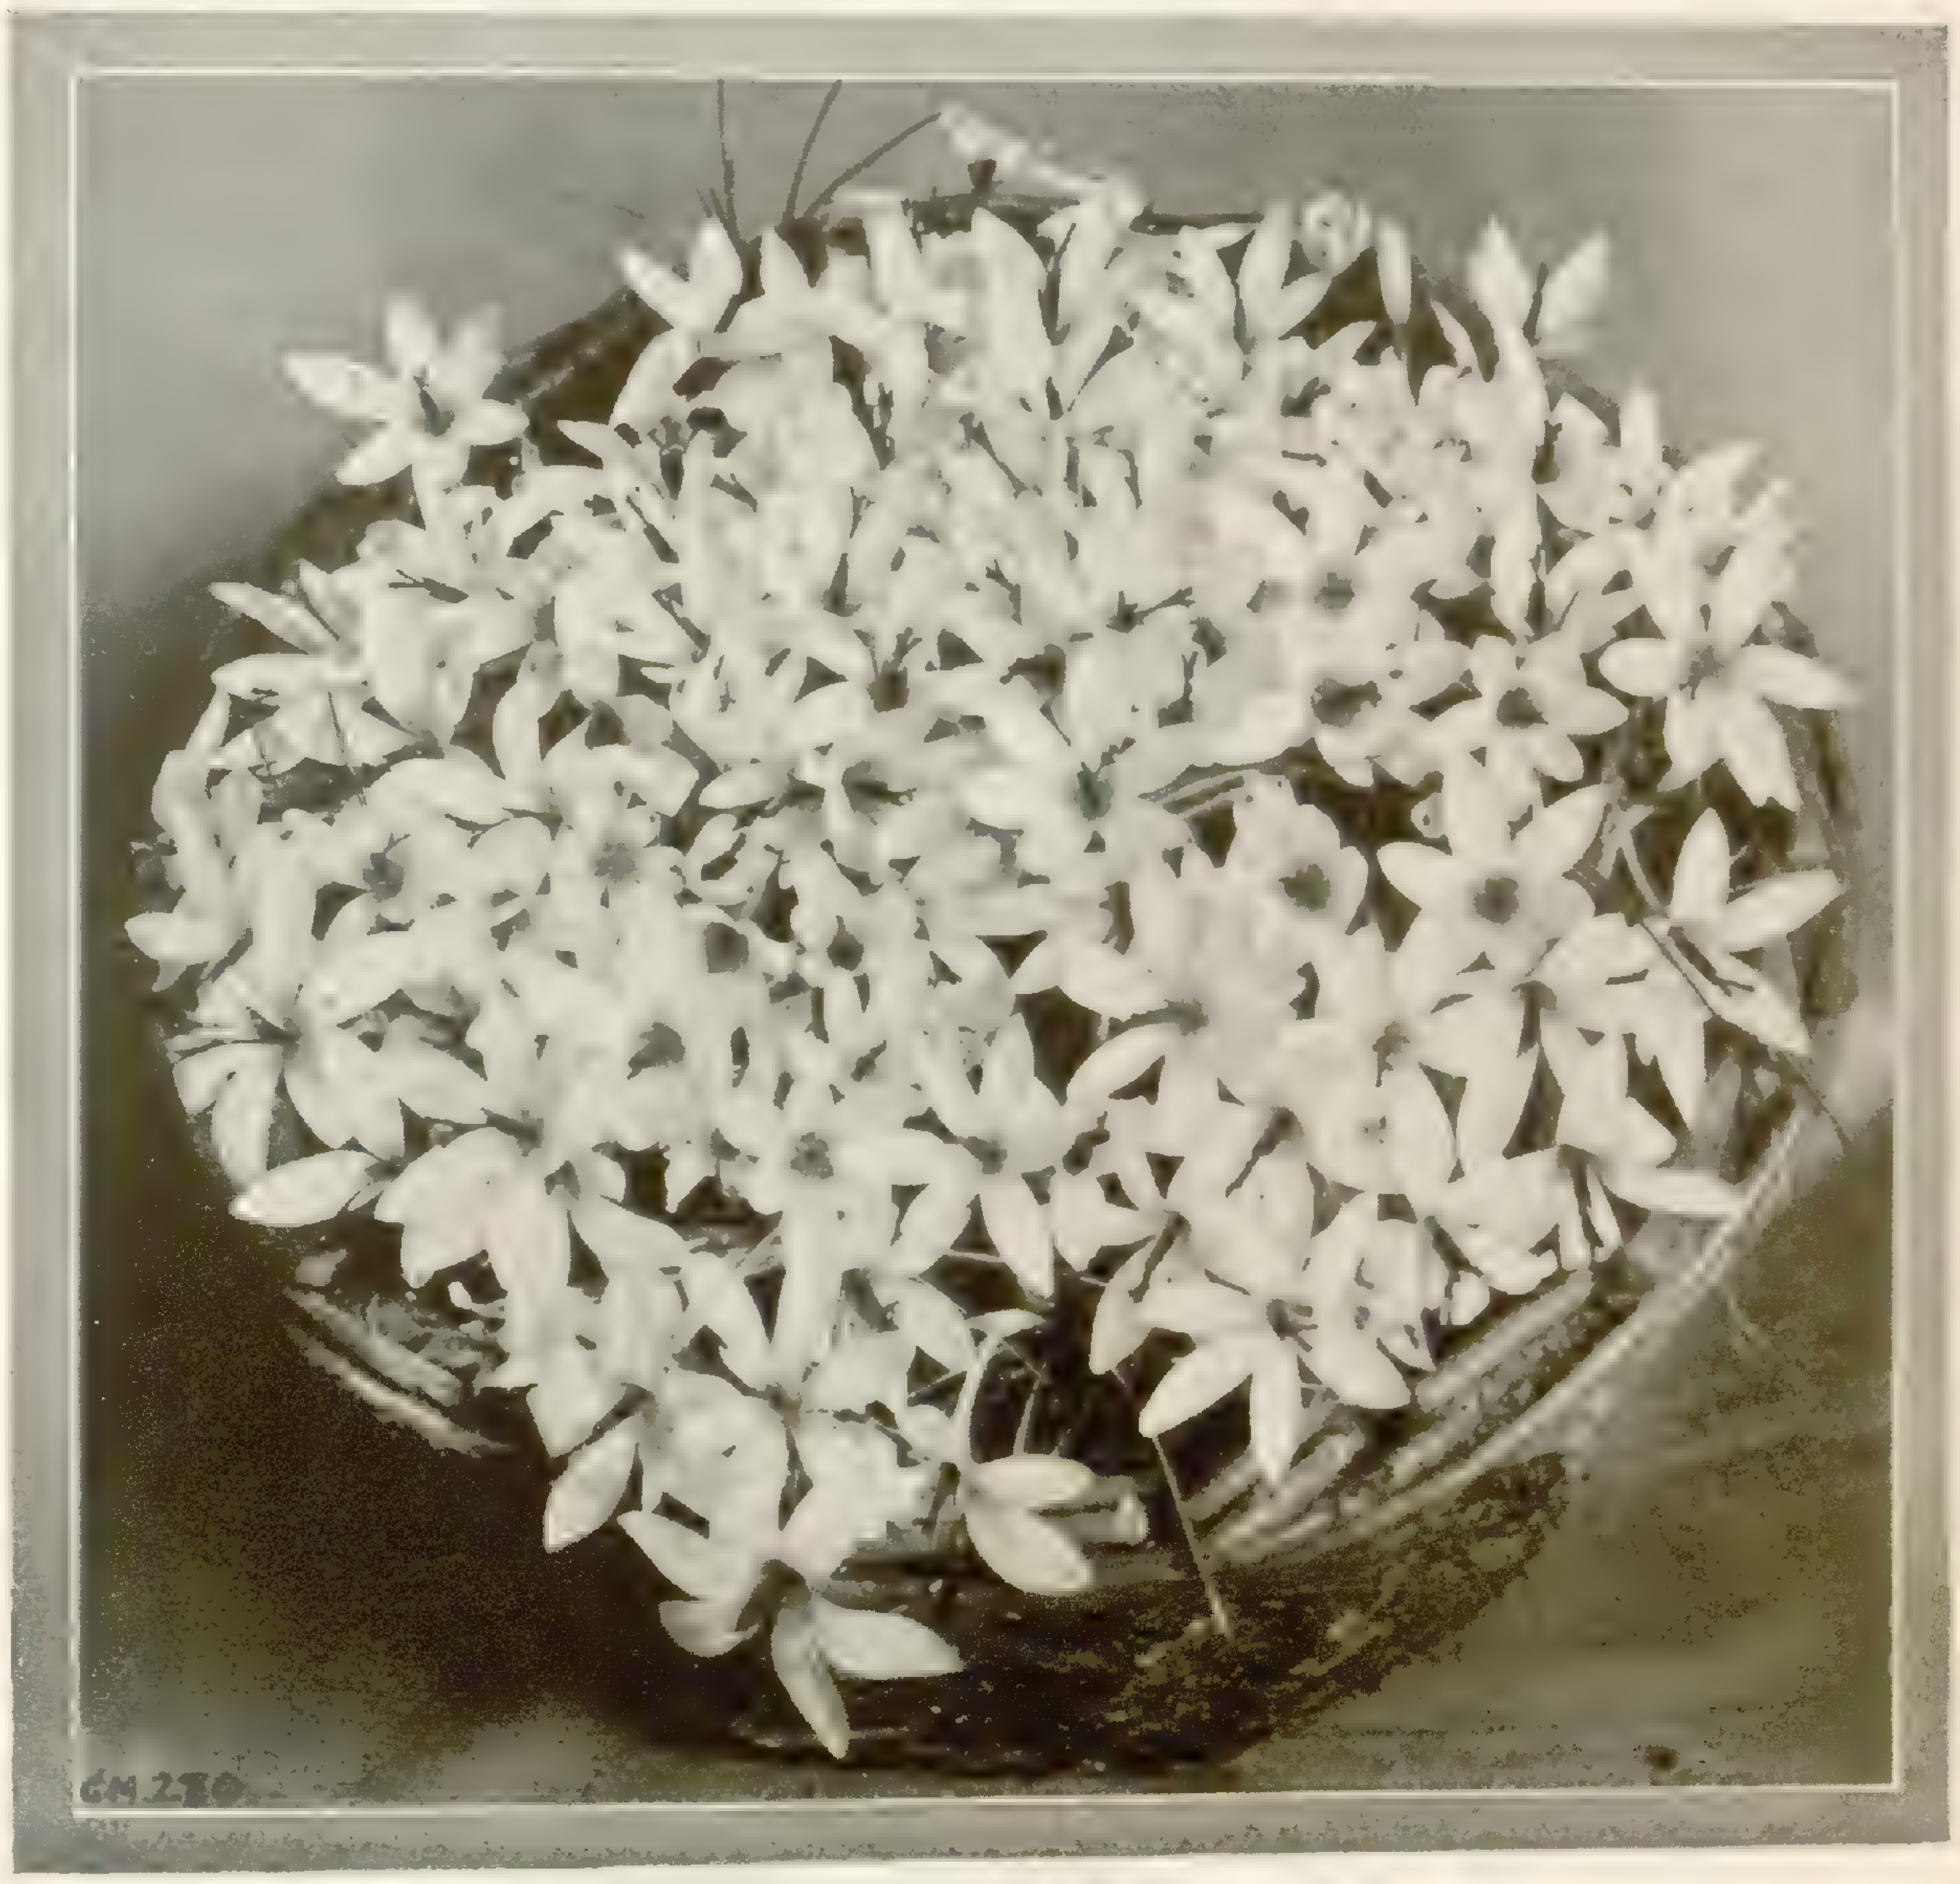
Spring without the crocus would be deprived of one of its most beautiful flowers, and it is little wonder that year by year this typical plant of the season increases in favour, and becomes more appreciated by the lover of gardens and flowers. This increasing favour is displayed not only in the greater quantity of the ever-popular Dutch and golden yellow crocuses which are cultivated, but also in the additional appreciation with which the species of crocus are being viewed. The autumnal species are in greater favour than ever before, and even the opulent charms of the best-known varieties of Crocus vernus cannot well restrain the advance of the other species.

One of the prettiest of the spring-flowering species of crocus is that named C. Malyi, a beautiful little flower, which, although moderate in price as prices go for such flowers, is but little cultivated, save by a few. The illustration gives an idea of the beauty of a mass of this flower when open in the sun. It is that of an exhibit made by Messrs. Barr and Sons, London, at one of the meetings of the Royal Horticultural Society last spring; this firm making a special feature of these crocus species.

Although a coloured plate would be required to do justice to this basket of flowers, it is easy to realise the effect of this mass of pretty white blooms, with a yellow throat, opened wide as they appear in the photograph. The exterior of the segments is also white, occasionally with a few purple markings, yellow at base, and with a yellow tube.

Crocus Malyi was first discovered by Herr Maly—in honour of whom it was named—on Monte Vermaz and Monte Orjen, above the Bocco de Cattaro, Dalmatia, at an altitude on Monte Orjen of 7,260 feet; and it is perfectly hardy with us. It was described by Professor Visiani in the supplement to his "Flora Dalmatica," and is figured and described in Mr. George Maw's magnificent monograph, "The Genus Crocus," pp., 127-8, plate xviii. It belongs to the section Involucrati, and to the division with parallel fibres on the corm tunic, the yellow throat and the parallel fibres distinguishing it from C. vernus. It is a good doer in this country and can be successfully grown in ordinary soil, not too heavy. It flowers with us in March. This beautiful crocus ought to be noted by those who admire these lovely flowers of the spring months.

S. Arnott.



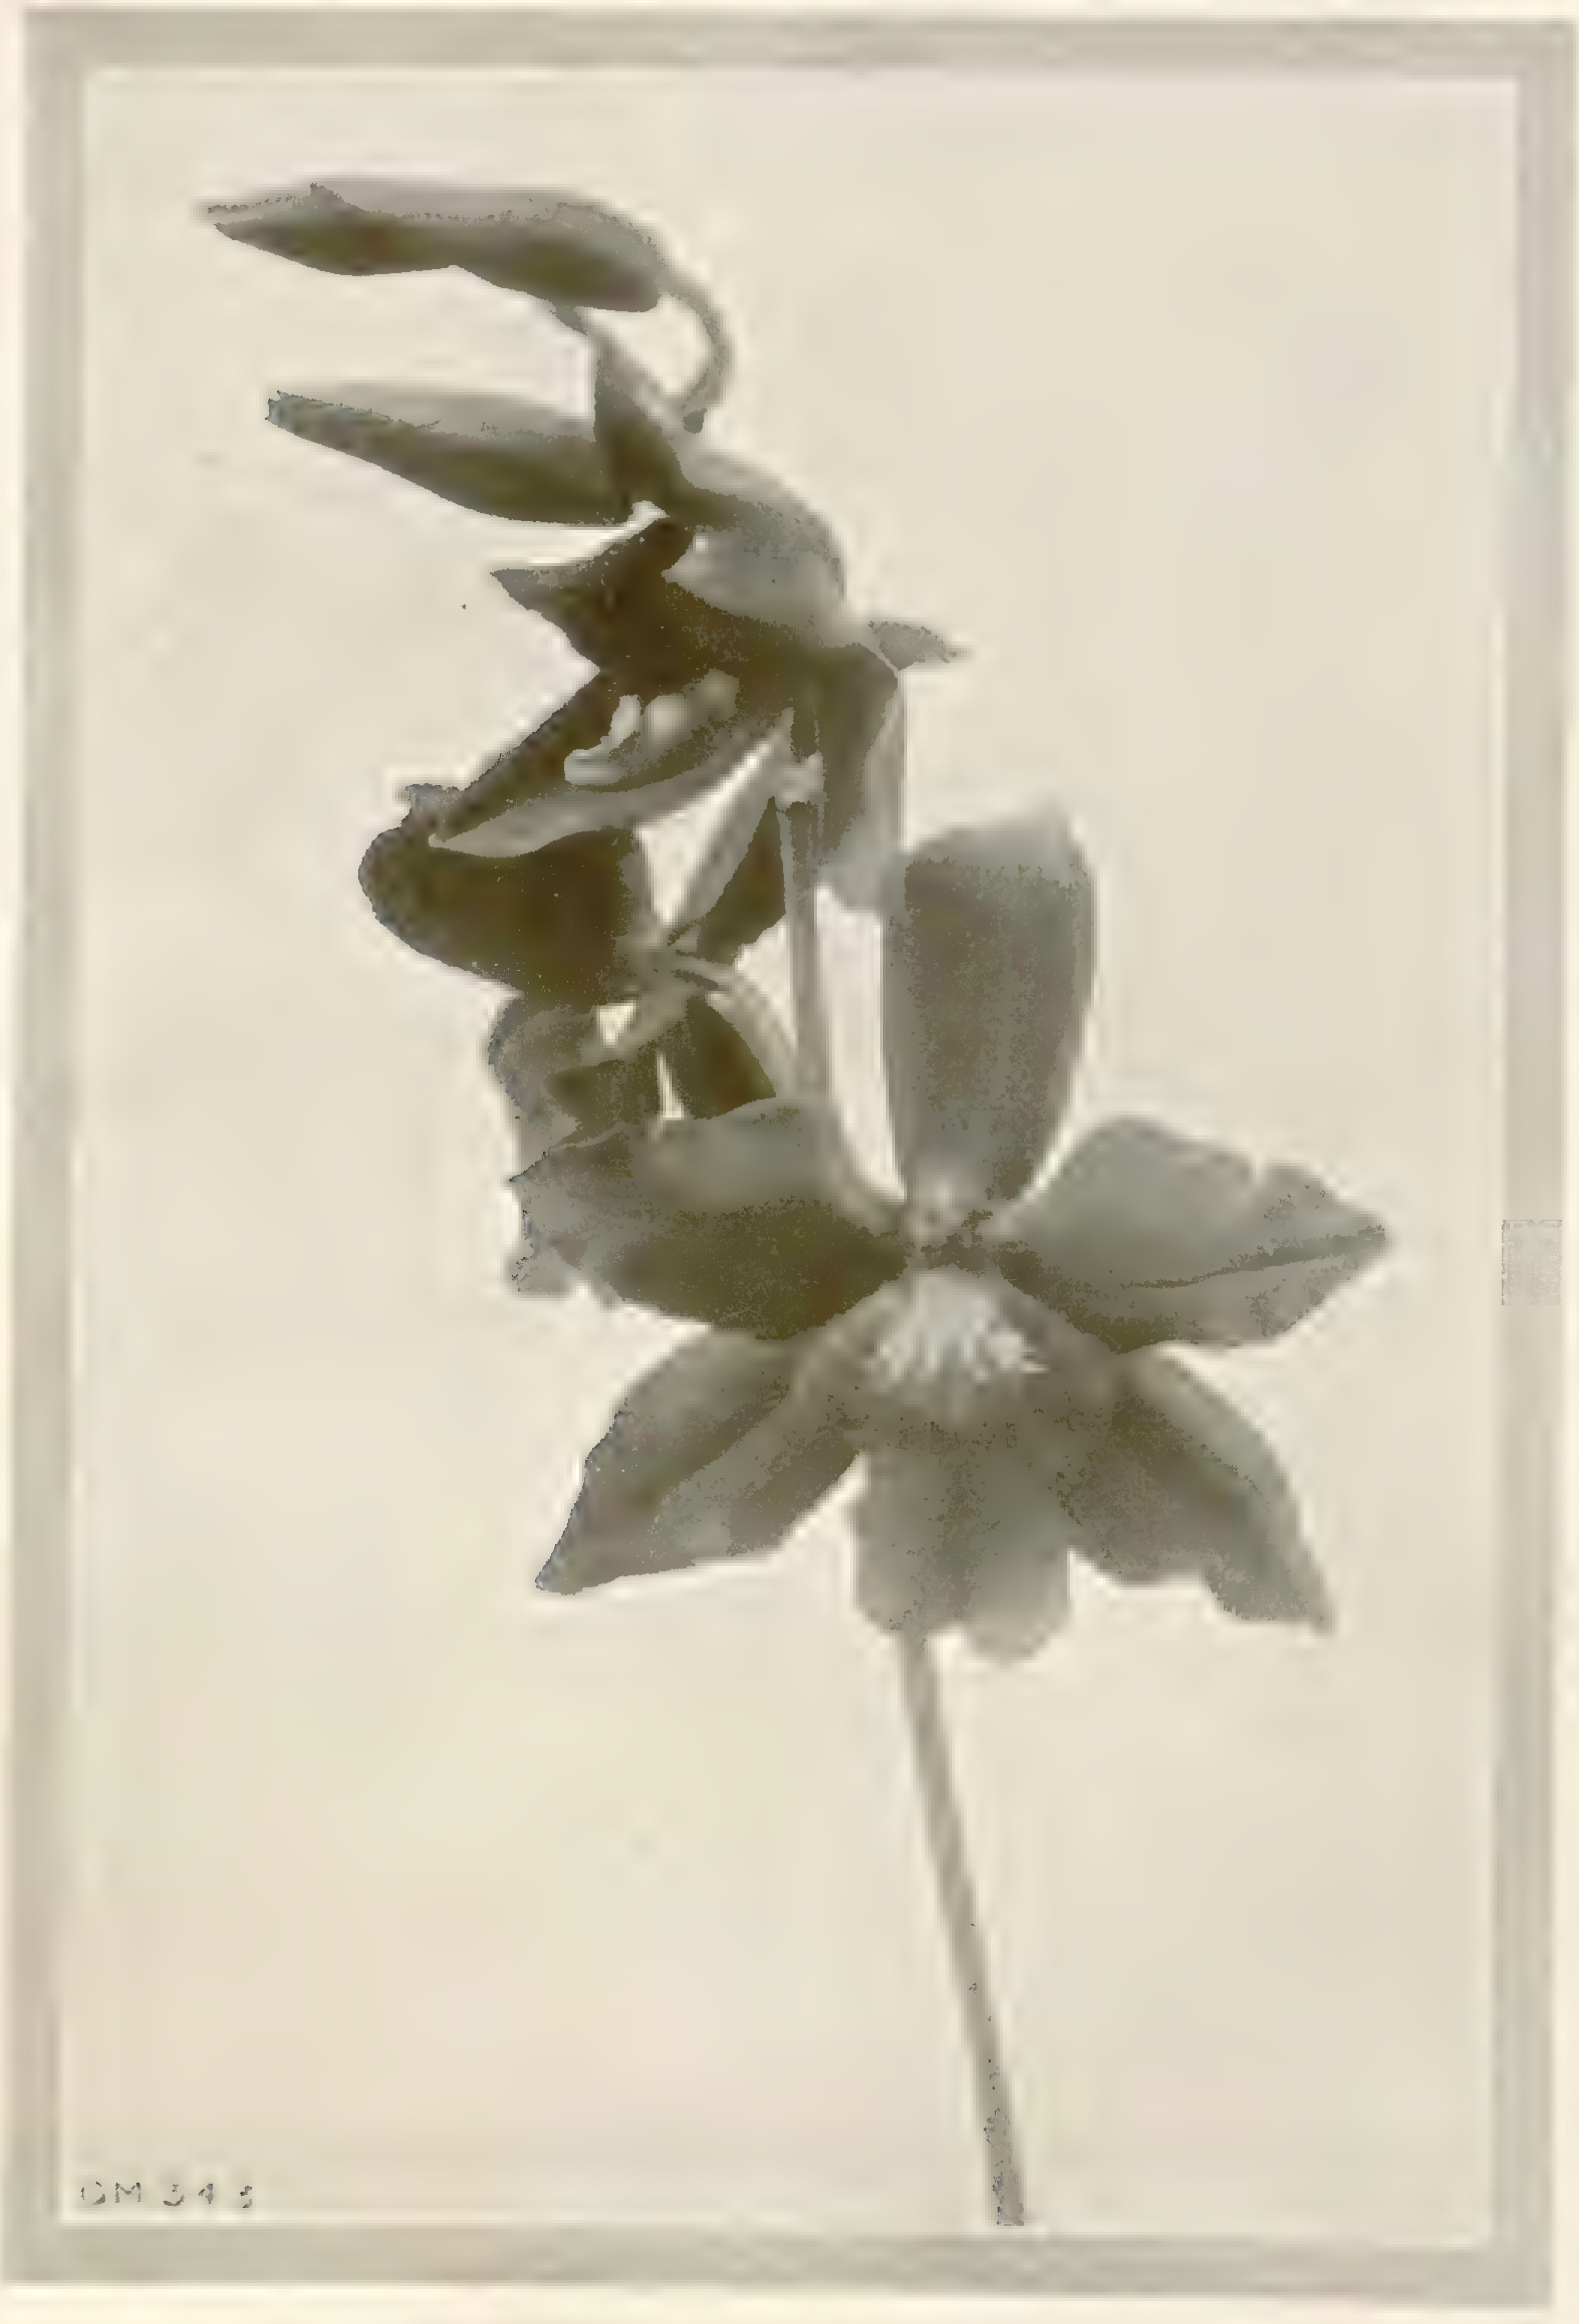
CROCUS MALYI.
As shown at a R.H.S. meeting by Messrs. Barr and Sons.
Flowers white, with yellow throat and tube; exterior sometimes marked with purple.

Cœlogyne Dayana has, perhaps, more attractions for those not used to orchid culture than for orchid specialists, but when grown in the manner we used to see it in Baron Schroder's group at the Temple Show, is a subject worthy of every consideration. Later than usual this season, the plants are now advancing their flower scapes. I consider that when in this state every encouragement should be afforded them. The temperature of the East Indian house or plant stove suits the species well at this period. If removed to cooler conditions as soon as the spikes have fully developed the flowers last in perfection for some weeks. Repotting is best attended to immediately after the plants have passed out of flower. They should not be disturbed unless the compost is decayed or more space is needed. Annual top-dressing will often serve for several seasons. The plants are best accommodated in baskets, and the potting compost should consist of equal portions of fibrous peat and sphagnum moss. — H. J. Chapman, Oakwood Gardens.

ESHER PLACE, SURREY.

This delightful place, the residence of Sir Edgar Vincent, is situated in one of the prettiest parts of Surrey. Though only about 14 miles from town, and near the main Portsmouth road, it is well secluded, and quite free from all the motor traffic nuisance which now does so much to spoil roadside residences.

The mansion, which is a fine one, is reached by two drives, the one leading from the village of Esher, and a new one of considerable length, near the station. The park is of some magnitude, and beautifully timbered with very fine specimens, notably of beech, oak, and Spanish chestnut. The fine grove of Scots firs, which is known to many who visit Sandown Park, stands out conspicuously, and adds much beauty to the landscape. Some charming views are to be had from near the house. With the naked eye one can see Harrow-on-the-Hill, Windsor Castle, Southall, and Elstree.



ODONTIODA CHARLESWORTHI.

The most remarkable orchid exhibit at the recent Temple Show. It was a baby plant flowering for the first time, and it carried four flowers and two buds. The brilliant, solid, crimson-scarlet hue attracted general attention, and the rumour that the specimen had been sold for £1,000 lent it additional interest. It was exhibited by the raisers, Messrs. Charlesworth and Co., Heaton, Bradford, and is described in detail on p. 439.

The River Mole winds its way sinuously through the grounds, and much has been done to encourage the naturalisation of many beautiful spring-flowering plants along its banks. The historic Wolsey Tower is still preserved in the grounds, and forms an object of much interest to visitors. Tradition says—and it is generally believed in by the villagers—that an underground passage used to exist between the tower and Hampton Court.

Sir Edgar Vincent has largely extended and beautified the pleasure grounds near the house, the work being carried out by Mr. Thomas Gibbons, who has had charge of the gardens for some years, in a most pleasing and satisfactory manner. The Dutch garden is well thought out and tastefully arranged; there is a fine terrace and croquet lawn, and during the past winter quite a novelty has been carried out in the form of an amphitheatre. Several tiers of seats have been cut out, and formed with turf.

Large quantities of roses have been planted in masses, and were looking remarkably well. A wonderfully fine tulip tree, Liriodendron tulipiferum, the finest specimen I have yet seen, stands near the house, and, judging from its size, must have been planted soon after its introduction. The girth of the bole four feet from the ground is 23 feet, the spreading branches have a circumference of 300 feet, and the height of the tree is 90 feet to 100 feet. It is in splendid condition, and has apparently never been damaged by severe weather.

The glass department is not extensive, but it is well managed, and fully occupied. Large quantities of such plants as Plumbago capensis, Hydrangea hortensis, and the better varieties of cannas are finely grown for the ornamental vases and tubs in various parts of the grounds.

The kitchen garden is clean, and well stocked, and the fruit trees give great promise of an abundant supply. My visit, which was a brief one, was extremely interesting, owing to the courtesy of Mr. Gibbons, and not having seen these gardens for over 30 years, I can testify to the great improvement which has been brought about during that period in every department, and, with the keen interest which Sir Edgar and Lady Vincent take in the gardens and estate, and the energy displayed by their able gardener, one expects these charming gardens to develop in the future as in the past.

E. Beckett.

PEACH AND NECTARINE FLOWERS.

Once more the flowering of the peaches and nectarines is over, and each recurring season I am asked by different people why some of the varieties have such large beautiful flowers and others such small ones with no beauty in them.

This raises a very interesting subject, and it is about as easy to reply to as to determine the cause of some varieties of lettuce producing black seeds and other varieties white seeds. Of course, we do not know the cause, but the fact is there nevertheless.

Among peaches and nectarines some of the best varieties produce small flowers, for instance, Royal George peach and Elruge nectarine; though, on the other hand, some, perhaps equally excellent varieties produce large beautiful flowers, such as Noblesse peach and Pitmaston Orange nectarine. By some people considered to be the finest peach grown, Gros Mignonne also produces beautiful large flowers. It has been suggested to me that it would be better to grow all large-flowered varieties, as they are such a lovely sight when in full bloom. There is reason in the suggestion, as we find from experience the large-flowered varieties set equally as well as the small-flowered, the fruit is just as good when ripe, the trees require exactly the same kind of culture, and, moreover, give us such a feast of colour when in flower.

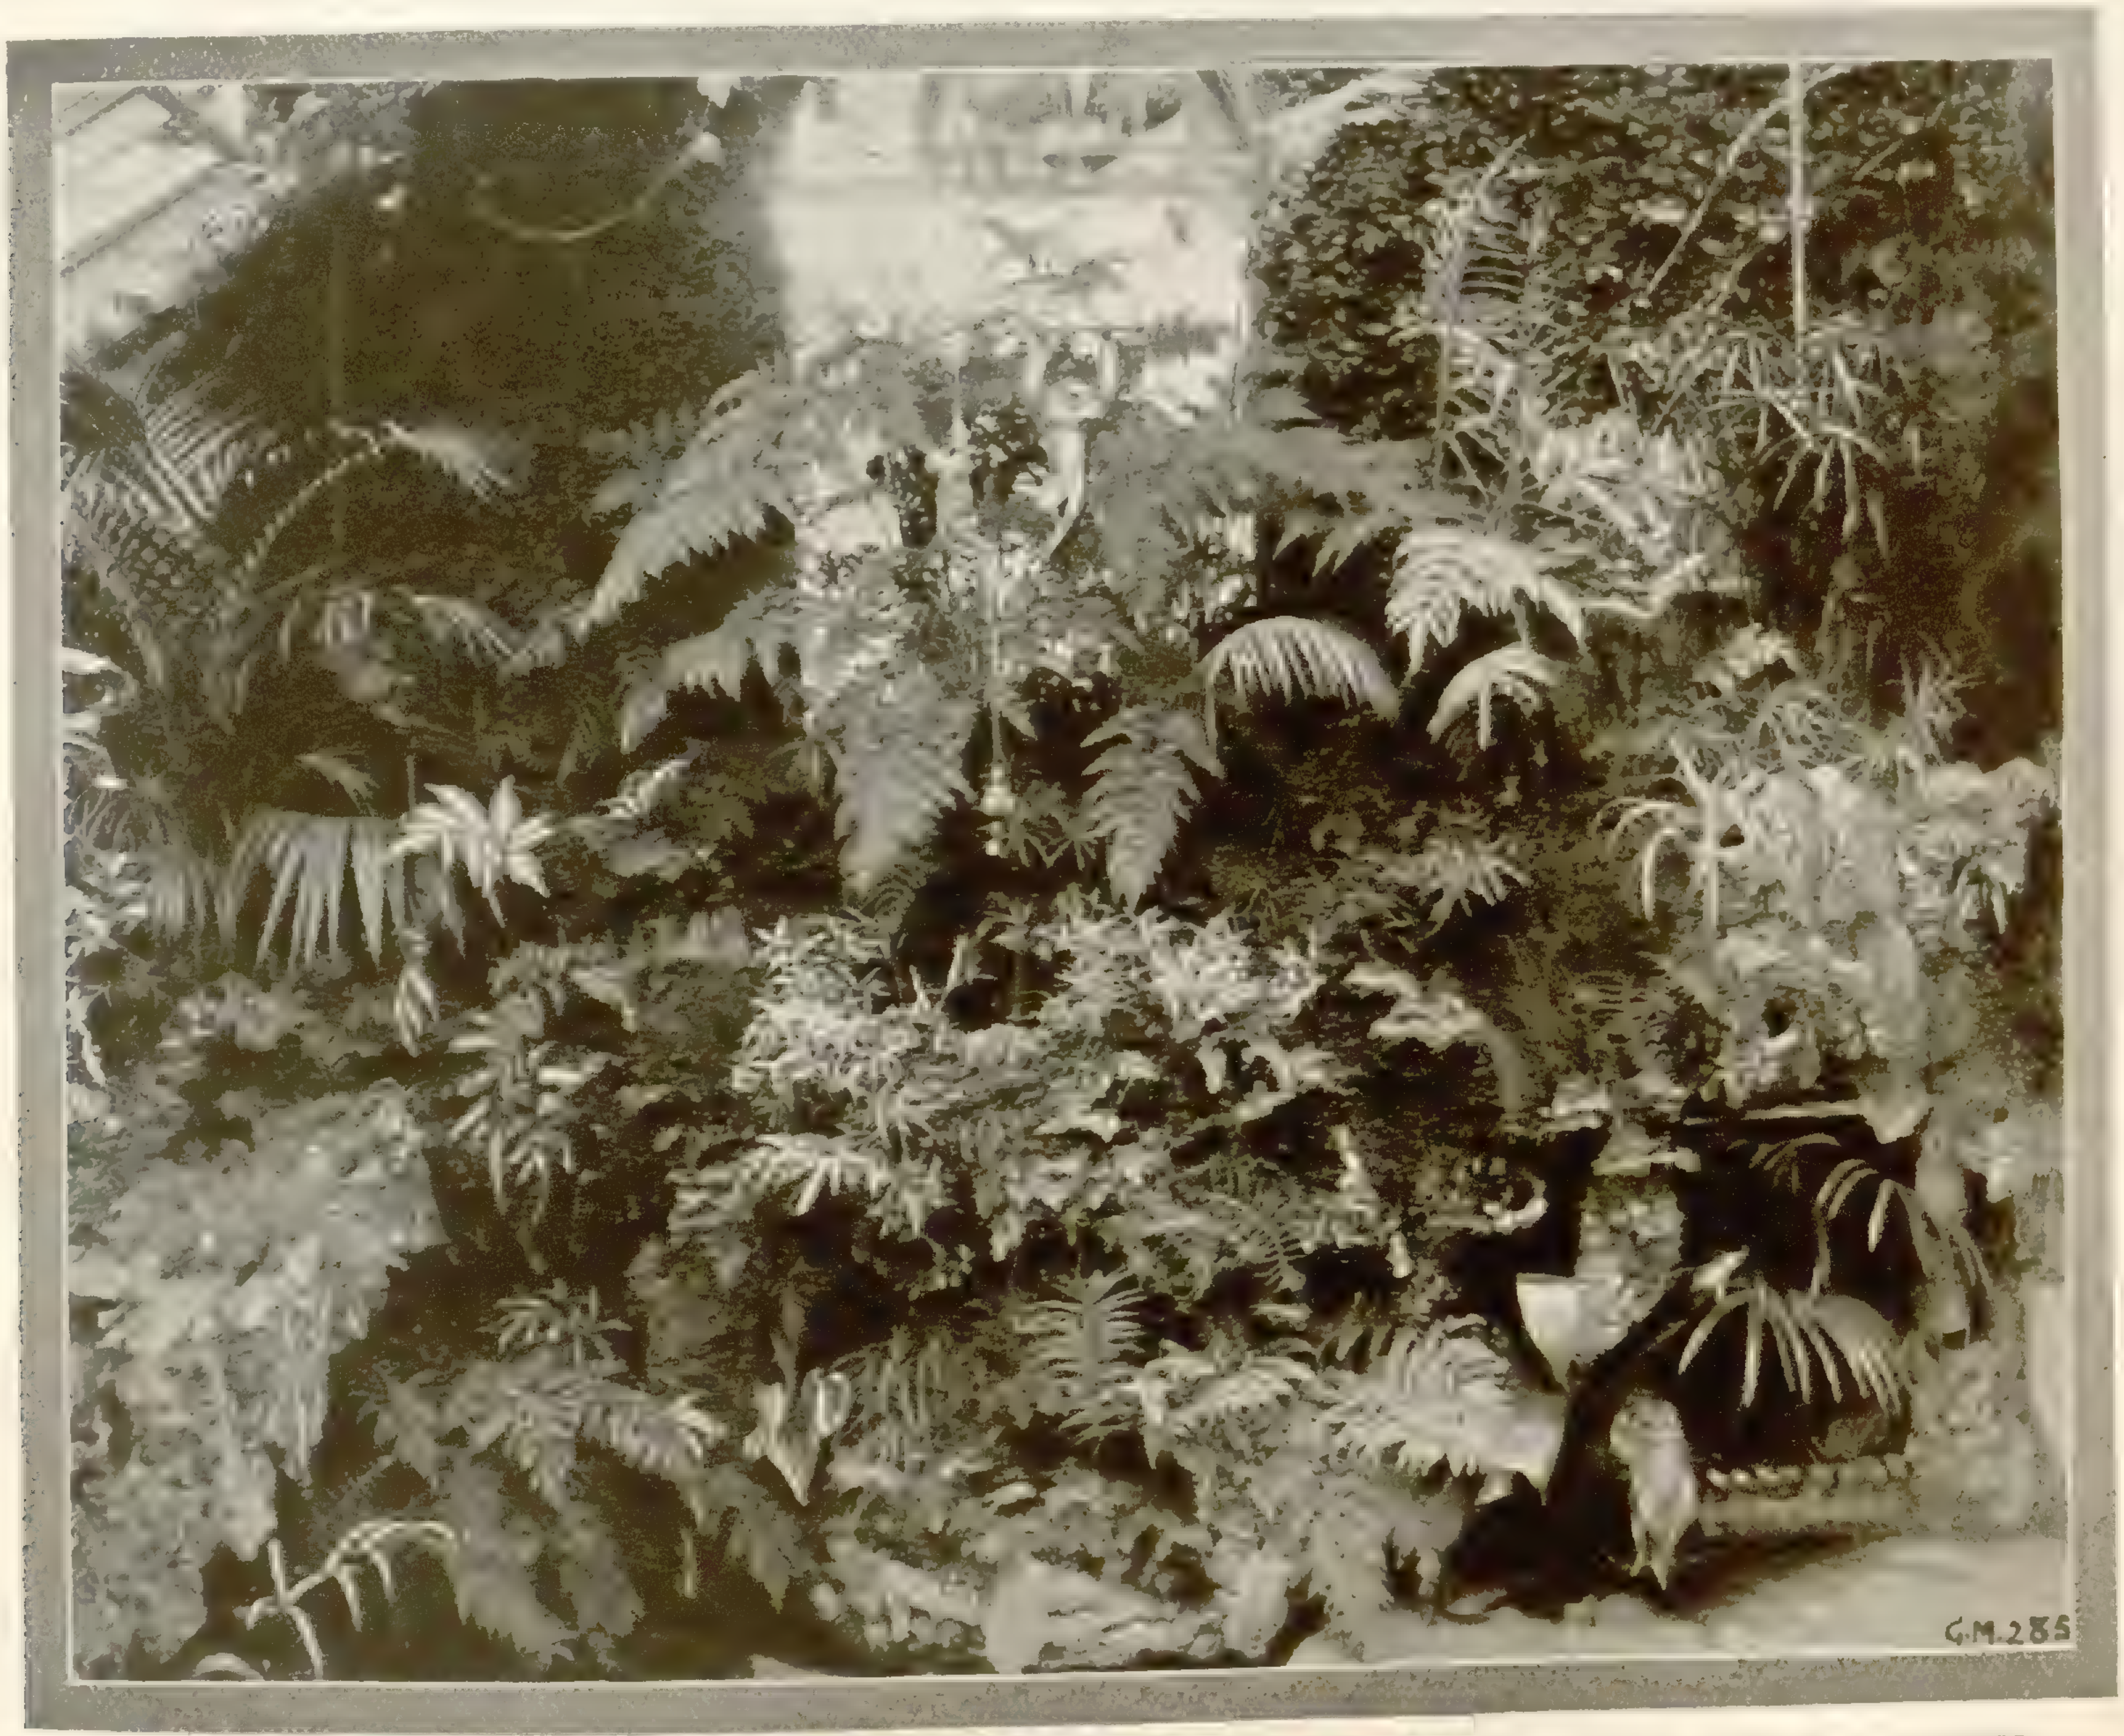
I would suggest that when nurserymen are compiling their descriptive catalogues of fruit trees they indicate whether the peaches and nectarines they include in their list bear large or small flowers. In the old gardening books peaches and nectarines were sub-divided into three classes—large-flowered, medium-flowered, and small-flowered, but for all practical purposes two classes, large and small-flowered, are sufficient.

Cheshire. W M

Colewort Cabbage.—If a sowing is made now of seeds of coleworts the resulting plants will be just large enough for planting out on ground that has been occupied by early potatoes. The plants should be put out about twelve inches apart each way.—T. W. B.

SHADY CORNERS OF CONSERVATORIES.

Where space under glass is too limited to admit of devoting a house or houses to ferns and other shade-loving plants, many of these latter may be well and effectively grown in the shady portions of conservatories or other houses in which a greenhouse temperature is kept up. There is no doubt that many ferneries are kept too hot and close for the majority of ferns in order to suit those species which require a higher temperature, much to the detriment of the cool species which, under the more forcing conditions, keep on growing when they should be resting, and make soft fronds which are easily injured and without stamina.



A SHADY CONSERVATORY CORNER PRETTILY PLANTED IN A TEIGNMOUTH GARDEN.

The cool species generally enjoy a plentiful supply of fresh air, and they can be well accommodated in the ordinary conservatory, provided they get the requisite shade. In such a structure general effect has to be studied, and to my thinking ferns never look so well as when planted out in rockeries, which, if built with an eye to providing suitable pockets for the plants, can be rendered very effective. It is not my province here to go into cultural details, but I may say generally that in rockeries built for ferns the pockets are frequently made too deep, and that the foundation of the structure is generally a mound of soil, which has a tendency to become sour, instead of broken stone or brick ends which have an absorbent nature, and which provide just what is wanted for any roots that may find their way beyond the pockets proper. The latter, too, should generally be shallow, the soil peaty, and well incorporated with broken bricks, etc., to render it and keep it sweet and open. When we consider the great number of ferns, including all the adiantums, which have rhizomatous and surface loving roots we may readily see that depth of soil is not what they want, and that deep pockets are a mistake.

I have under my charge a corridor planted with ferns in tufa rockwork, and where the temperature is low and the circulation of air is ample. In this corridor we find Cyrtomium falcatum the fern which can be depended on to do well in all positions, and it is the one used for portions where others refuse to grow, and I may say that no position comes amiss to it. Many of the adiantums do well here, notably A. Mariesi and A. fragrantissimum, as also do the Aspleniums, of the A. flaccidum type, Davallia canariense, most of the Nephrolepis, including the two beautiful additions to this family, N. todeaoides and N. Whittmanniana; Phlebodium Mayii, Balantium culcita, and Osmunda palustris, one of the most beautiful cool house ferns imaginable, which, unlike the better known but less beautiful (under glass), O. regalis, is evergreen, the young fronds being of a beautiful rosy hue, and in form they are much like those of a strong growing adiantum. I must not overlook the Stag's-horn fern, Platycerium grande, which, as grown on the face of the tufa, is very attractive. Many of the stronger growing pteris formerly did well, but I would suggest these being used with great caution, and only when one is thoroughly satisfied they are free from the wretched little begonia mite which, from the havoc it makes among the pteris, might well have its name changed to that of pteris mite.

In the fernery proper, where the conditions are more those generally chosen for ferns, i.e., warmer and closer, we are able to grow greater variety. Here, too, the ferns are planted out in tufa rockery, and in addition to those already mentioned Adiantum formosum, A. digitatum, A. cardiochlœna, and A. concinnum are excellent as well as Blechnum brasiliense, Didymochlœna lunulata, Asplenium erectum, and A. longissimum, and the very pretty, small growing Lomaria Herminieri, with its rose-tinted fronds. All these are in the first-class for decorative purposes, but perhaps scarcely suited to the airy conditions of the conservatory.

One need hardly point out the value of begonias of the Rex type for use among ferns and palms for these shady nooks, especially where the subjects may be planted out in rock work. Among foliage subjects entirely adapted to the purpose, and most decorative where plants of a larger type cannot be planted, is the beautifully marbled Peperomia Saundersii, one of the cleanest and most attractive plants that can be grown as a sub-setting to most of the subjects mentioned earlier.

Another valuable set of plants requiring very little soil or attention are the creeping ficus in variety. These have a habit, though, of encroaching on their neighbours root and branch, and should be carefully watched and cut within bounds at least once a year.

In the illustration given it will be seen that many other subjects beyond those I have mentioned have been introduced to form an attractive group under conditions not suited for the majority of flowering plants, but which can vie with their gayer neighbours in grace of form, habit, and general attractiveness. J. C. Tallack.

Shipley Hall Gardens.

FRAGRANCE OR SCENT IN THE GARDEN.

All the senses are rich in the power of association, and none of them is more so than that of smell. A writer in "Scribner's Magazine" some time ago said: "A few notes of a buried song, a perfume of trodden grass, the odour of a flower, an old familiar word or two, even commoner things have at times enough magic in them to uncover long-forgotten faces, disclose distant lands or vanished scenes, although in one's memory a mould has covered them for years."

That is a good description of the association of ideas. Some may not have thought of it before, but having it brought to notice everyone will think of instances of it in his own experience—how the smell of box in spring, that box which Oliver Wendell Holmes tells us "breathes the fragrance of eternity," carries him back to the box edgings of some old-fashioned garden he was familiar with in his boyhood, or how the sweet freshness arising from the transplanting or dividing of primrose roots recalls the getting of primrose roots from the woods and ditches. So Thackeray, in "Esmond," says: "Esmond's mistress knew he would like to sleep in the little room he used to occupy; and it was made ready for him, and wallflowers and sweet herbs set in the adjoining room." Miss Gertrude Jekyll speaks in "Wood and Garden," apropos of dividing primrose roots, of "the luxuriously fragrant heap of refuse leaf and flower stem, and old stocky root" which rises in front of her as she sits on a stool in her copse pursuing her idyllic occupation.

Mr. Harry Roberts, in his "Book of Old-Fashioned Flowers," says that there is probably no pleasure so democratic as that yielded by the fragrance of flowers and leaves, for whereas the colour and form of plants require a little attention for their appreciation, their odour overwhelms our senses whether we attend or no. The power of smell can be cultivated, and there is no doubt that we miss pleasure in our lives which—like other gifts of nature—lies ready to hand and only awaits our fitting ourselves to receive it. Browning says:

> "There is a world of capability
> For joy spread round about us,
> Meant for us, inviting us."

One would almost feel inclined to say that the rule "degustibus non disputandum" (tastes barred from discussion) might be suspended when discussing the odours of flowers, taking it for granted that every one enjoys the smell of sweet flowers. Yet one comes across amazing instances of divergence of opinion on this matter. The scent from a field of beans in flower, when wafted across the country, is to many one of the sweetest odours in nature, and yet some dislike it, while sweet peas are positively objectionable to some. Perhaps it is more intelligible that some dislike the scent of May and pear blossom. The smell of violets is found by some professional vocalists to be harmful to the voice, while a momentary smell of tulips gives some a headache. Lilies of the valley are said to be harmful to the sick, and perhaps the scent of many flowers is so when in too concentrated a form. The world of animals and insects has similar likes and dislikes, for while cats love Nepeta cataria (Cat Mint) and Valeriana officinalis, the latter producing an effect almost akin to intoxication, the smell of cloves, rosemary, and lavender is a useful deterrent to moths. Mr. William Robinson, in his "English Flower Garden," says that "a man who makes a garden should have a heart for plants that have the gift of sweetness as well as beauty of form or colour." We do not realise how bountiful Nature has been in endowing plants with sweetness, some mainly giving off their scent by night, such as Nicotiana affinis, night-scented stock, and œnothera, and others by day; some through their flowers and others through their leaves; some only at the time of early spring growth, as in the budding larch, and some of the pines, some only when decaying, as in the case of strawberry leaves, and some, with a little provocation the whole year round, such as lavender, bay, and the herbs. We are apt to set so much value on mere display in our gardens that we neglect plants which only provide us with fragrant foliage, which is there all the year round, to be enjoyed alike at Christmas and at midsummer.

There are many flowers which are not generally recognised as sweet-scented because the scent is so delicate, but if we take a number of blossoms together the scent is very apparent, and all the more ethereal. Pansies are an instance, though some are sufficiently strong for one flower alone to give a rich fragrance. Wild hyacinths, wood anemones, and even primroses, only smell collectively, while heather and furze, which have no noticeable smell in a small piece, yet, on the moors, especially in Cornwall, where the dwarf autumn-flowering furze is common, they give that incomparable wildflower air which, once smelt, is always remembered.

To the garden lover it is a bountiful provision of Nature that there are so many sweet-scented things in every class of plant. If he makes a speciality of shrubs and shrubbery plants he has lilac, mock orange, weigela, roses, may, honeysuckle, sweet bay, winter sweet, lavender, sweet gale, rosemary, southern wood, white jasmine, myrtle, and many others. If he devotes himself to annuals, the choice of fragrant plants is as great, and we need only mention sweet peas, stocks, mignonette three things no garden should be without—sweet sultan, scabious, Nicotiana affinis, rockets, and so on. And when we come to perennials, then surely we have the sweet-scented garden in its highest perfection, and so full of sweetness is it that its fragrance overflows its boundaries and gives pleasure not only to the neighbours, but to those who pass by. It is these which make the delight of the old-fashioned garden with their borders of pinks, carnations, and lilies of the valley, their primroses and auriculas, white lilies and sweet-scented day lilies (Hemerocallis flava), violets (the wild wood violet, sweetest of all), iris, pæonies, arabis, and aubrietia in the early spring sun, and, perhaps sweetest of all, a "sun-baked bank of wallflowers." The flora of warmer climates has of late years added to our immense selection of sweet-scented flowers, but it has given us nothing sweeter than these.

Having then such wealth let us make up our minds not only to have abundance of fragrant foliage in our gardens, but to have some sweet-scented flowers all the year round. This is quite possible, for the winter heliotrope, winter sweet, daphne, Czar violets, Iris stylosa, and I. reticulata last long enough to see the first primroses and pansies take up the succession, and even before these we have the delicate freshness of the snowdrop and the crocus, while wallflowers may with a little trouble be had in flower from October to May.

The more we enjoy the sweet scents of the garden the more enjoyment they will be capable of affording us, and thus we shall be laying up a store of enjoyment for our old age. I may fitly conclude this article by a quotation from the English classics, and that from no less a writer than Lord Bacon, in his essay entitled "Of Gardens": "Because the breath of flowers is far sweeter in the air (where it comes and goes, like the warbling of music), than in the hand, therefore nothing is more fit for that delight, than to know what be the flowers and plants that do best perfume the air. . . . That, which above all others, yields the sweeter smell in the air, is the violet, especially the white double violet. . . . Next to that is the musk rose, then the strawberry leaves dying, with a most excellent cordial smell. Then the flower of the vines . . . Then sweet briar, then wallflowers, which are very delightful to be set under a parlour or lower chamber window. Then pinks, especially the matted pink, and clove gilly-flower. Then the flowers of the lime tree. Then the honeysuckles, so they be somewhat afar off. Of bean flowers I speak not, because they are field flowers. But those which perfume the air most delightfully, not passed by as the rest, but being trodden upon and crushed, are three, that is, burnet, wild thyme, and water mint. Therefore you are to set whole alleys of them to have the pleasure when you walk or tread."

Alger Petts

SEDUM KAMTSCHATICUM VARIEGATUM.

The stonecrops of Easternmost Asia are generally better garden plants than European ones, thriving apace in the ordinary soil of borders, and giving a dis in late summer and early autumn w most species have passed their b Typical S. Kamtschaticum has been w us for a long time, and did not make h way, but the variegated form leaped popularity at once, and is now rega as a model rock plant, ever present and in summer and autumn capable forming the prettiest group in the garden. Like most stonecrops it pos a strong, almost unkillable cons tion, and in a light free soil it qu grows into patches 2ft. or 3ft. square leaves and flowers combining in a scheme of white, green, and gold that cannot fail to please.

The lengthy trails are thickly studded with oval leaves whose colouring varies from grey-green to white and yell growths terminating in a flattened of bronze-gold buds that are in the s superlatively attractive. The tra from buds to flowers and from flowe seed capsules is slow, and almost i ceptible, for all retain the bron colouring, but there is more gold bronze when the flowers are fully op plant of this description deserves a pe nent place in the rock garden, and one can suggest further uses, that of furnishing the bases of sun-dials, pillars, vases, and other ornaments of stone or ware. It readily grows in gravel, and the growths root as they lengthen. The plant has received the Royal Horticultural Society's Award of Merit, and I think everyone w it in good condition invariably ad

THE VALUE OF WHITE FLOWERS.

"Blossoms white as driven snow
Blush beneath the sunset glow,
Spread, and drape in fashion grand,
Cloaks of silver o'er the land."

The garden that lacks sufficient white flowers will never be satisfactory, and it is the absence of this colourless colour, which is a combination of all colours, that makes many a home landscape perplexingly unpleasing. This age of red brick demands more white blossom than did former times, when houses were mostly cream or grey; the white-painted woodwork that adorns modern villas is the architect's attempt to subdue the brilliance of scarlet, but the gardener must further carry out the effort in beds, borders, and shrubberies if the appearance of the dwelling is to be artistic.

Nature always gives white bloom as well as coloured, whether in woods, fields, or hedgerows, cornfields or commons, at all the floral seasons of the year; the anemones of spring, and daisies among autumn's wear being noteworthy instances.

In our gardens arabis is a great boon early in the year, with the white varieties of narcissi, tulips, and hyacinths: it is as summer brings a wealth of gorgeous hues that white becomes more rare, and then it is that by bedding out we should introduce it in considerable quantity. Marguerites, stocks, asters, pelargoniums, and nicotianas are the ordinary plants ready to hand, with candytuft and sweet alyssum among the popular annuals. Seldom are the giant candytufts grown to perfection, so it is not too much to say that their beauty and size will astonish all who treat them well. The Empress variety is perhaps most effective, the Spiral being more elegant.

By a little care we can arrange exquisite beds of all white flowers, without using any of these invariably-patronised subjects however: the white giant verbenas can scarcely be surpassed for loveliness, and if plants of white single cactus dahlias are set at wide intervals over this carpet of pegged-down verbena there will be plenty of flowers on a high as well as a low level.

Other first-class bedding plants obtainable in white are begonias, clematises, lobelias, petunias, violas, zinnias, sweet sultan, and giant centaureas, poppies, cornflowers, Phlox Drummondi, dianthus, godetias, cosmeas, balsams, scabious, carnations, campanulas, hydrangeas, zonal pelargoniums, lupins, Lavatera trimestris, linarias, gilias, daturas, cerastiums, clarkias, collinsias, annual chrysanthemums and antirrhinums.

It should be remembered, too, that white variegated or silvery foliaged plants give the same cool effect as white flowers, and ought to be well represented. Perpetual white masses are, of course, of yet more value in the garden, but though they cannot be added until autumn, it is during summer that the zealous gardener will make notes as to the exact localities thus to be cooled, and at the same time lightened in appearance, while visits to shows and to florists' grounds will suggest numerous novelties and reminders of old forgotten favourites.

For sunny places pinks, Chrysanthemum maximum, Japanese anemones, and early chrysanthemums prove successionally attractive; for shady ones the summer and autumn phloxes thrive best, though chrysanthemums, Japanese anemones, hollyhocks, campanulas, and Michaelmas daisies often do very well. Perhaps the chief shady garden beauty of spring is the aquilegia, and of early summer the spiræa, dwarf as well as shrubby.

Window boxes in full sunshine can be admirably filled with miniature polyantha roses, such as White Pet, a fact of which enough use is never made. Verbenas again prove useful, with the marguerite as an unfailing standby.

A lawn bed that is to be seen from a good distance, across park land, for instance, shines out best of all if massed with white flowers; indeed, a hill-top bed of white is visible, like a snow cap, beyond many an acre.

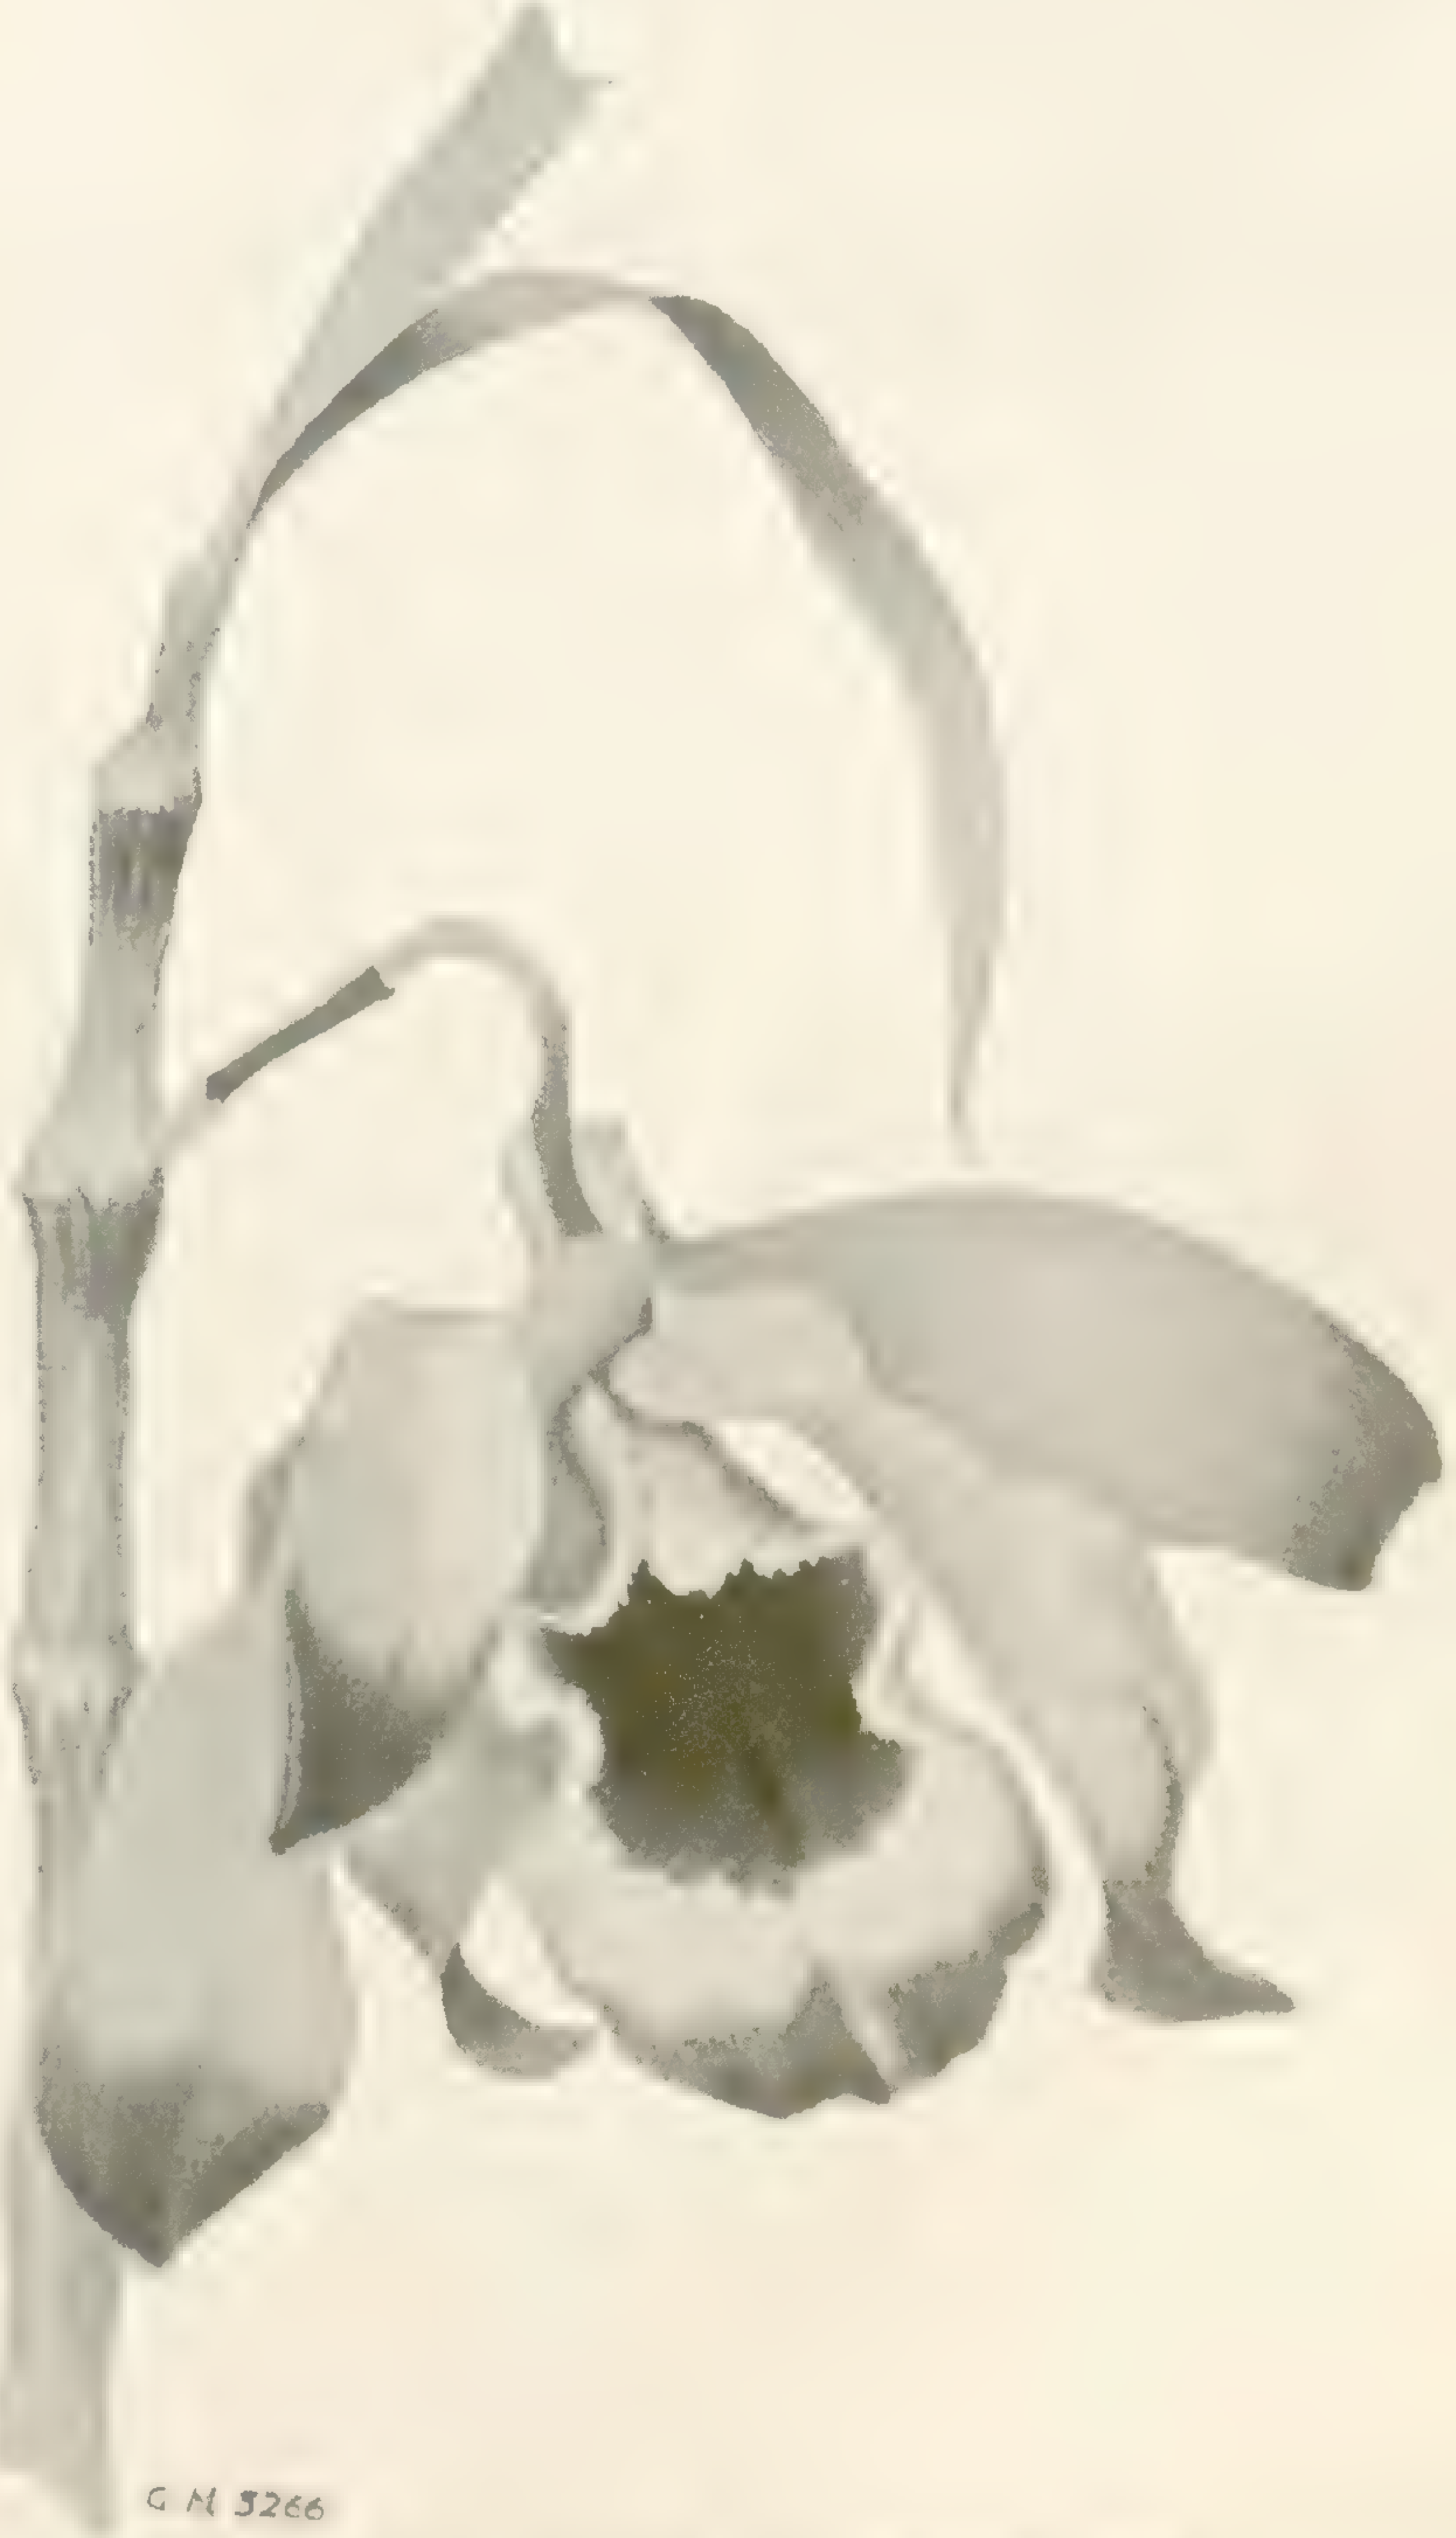
White roses up red walls are perfect, but it is wise to plant white-variegated ivies as well, in order to keep up the effect when rose blooms are absent; any time during summer I have planted ivies successfully, giving copious supplies of water and a mulch of leaf-mould to keep the roots cool. White lilies cannot be too highly praised, and should be divided and replanted after blooming if the clumps are too thick, so the gardener has another summer chance to increase the living snow of the beds and borders. M. H.

Autumn Displays. — Where an autumn effect only is required, and borders are suitable, pleasing displays can be made by planting annuals and herbaceous plants in clumps or masses rather than mixing them. Select the autumn bloomers of both sections, and arrange them according to height. A further sowing of mignonette may yet be made, and should there be any biennials not sown no further time should be lost in sowing them.—E. F. H.

DENDROBIUM VENUS GRANDIFLORUM.

Among the many hybrid dendrobiums which Mr. Norman Cookson has been successful in raising and introducing, D. Venus (Falconeri and nobile) is undoubtedly one of the finest. The typical D. Venus was exhibited by Mr. Cookson on April 14, 1891, at the Royal Horticultural Society's meeting, and received a F.C.C. The subject of the accompanying illustration, D. Venus grandiflorum, was raised among the original batch of seedlings. It is to D. Venus what the best forms of D. nobile nobilius are to the typical D. nobile, altogether larger, finer in substance, and the deep rosy-purple of the tips of the sepals and petals is extended almost to the base of these segments. In growth also it is much stronger, and flowers annually in profusion. It was exhibited at the R.H.S. meeting on April 21, 1903, and was awarded a First Class Certificate. Dendrobium Venus does best when grown under stove conditions, with a cool rest, and only sufficient moisture is required during the dormant season to keep the pseudobulbs plump. It is advisable not to remove the plants after the flower buds are formed until the whole have become fully expanded. Like its parent D. Falconeri, the flower buds usually damp and fail to expand when the plant is moved before the blooms have become expanded.

H. J. C.



DENDROBIUM VENUS GRANDIFLORUM.

Flowers rose, with rose-purple tips to sepals and petals, and dark blotch on the lip.

THEORY VERSUS PRACTICE.

At some time in his career every gardener encounters this controversy. It is frequently debated with much warmth and less benefit. Although at first sight the two may seem to be diametrically opposed they really are not. It is supposed that the theorist cannot do practical work, and the really practical man scorns theory. In point of fact, we do not find such men. We do find men differently endowed with a love of practical work or theoretic study, and, to a large extent, this is a matter of temperament and environment.

Theory here means that portion of experience or knowledge which is gained by means other than actual work. Reading garden literature, attending lectures, and studying sciences may be regarded as coming under theory. How any of these can disqualify a man for ability and success in actual work I cannot conceive. The theorist is regarded among gardeners much as is the idealist in social life. Yet all reforms have been inspired by idealists. Paradoxical as it may seem, only the idealist is a practical man, for until a person has an aim and destination there can be no purposeful progress. As in real life the idealist is often half a century ahead of his fellows, so is the garden theorist, for theory often begets practice. In men of horticultural repute it will be found that a due blending of theory and practice form the basis of success.

Practice is the actual work of gardening, but how this will ensure progress without the stimulant—theory—I cannot understand. The man who believes only what he finds by actual experience to be true will find himself scantily furnished with knowledge. Theory and practice represent the mind and matter—one might well say the soul and body—of gardening.

The arguments which can be adduced to show how irrational it is to despise theory possess force and solidity sufficient to break the bottom of an ironclad.

How can a man take an intelligent interest in his work if he is not conversant with the elementary principles of gardening, and how is he to obtain that knowledge in a clear, concise form unless he consults some recognised text book or attends lectures? Nor let it be imagined that the study of these principles is of no importance—that a man can become a good gardener without "all this rot." No man can become a good gardener who is unacquainted with the principles which govern his practice. He may have gained his knowledge in an unorthodox way, but possess it he must, or success can never be his. A knowledge of the bedrock principles of the profession is imperative, and I have yet to discover a simpler method of acquiring it than by reading, study, and observation.

The matter may be better explained by illustration. As a young gardener changes places he will have to take charge of fruit and plant houses with ventilating gear and heating apparatus of various kinds. Now if he has accustomed himself to act as a mere machine, to give a certain amount of ventilation at a certain time, and to be very chary of using his brains as if fearful of exhausting the supply, he will find himself in difficulties. If, however, he has made himself master of the fundamental principles, he will experience no difficulty in applying them in these varying circumstances.

Again, let a young man of the mechanical type, who has been trained in places fortunately free from certain pests, obtain a situation as foreman where the plants are a prey to many insect and fungoid pests. Imagine his difficulty, and think how much more confidence he would have if some portion of his spare time had been spent in reading the experiences of others.

We will suppose that a vinery is to be cleaned and started. At about the same time other gardeners will be starting theirs, and an article on the subject will probably appear in the garden papers. What possible harm can be done to a young man by reading such an article and comparing the writer's method with that prevalent in the place he works at? It is this power of comparison which stimulates reflection and favours progress. The very process of comparison sets the thinking apparatus in motion, prevents it becoming rusty, and favours the development of sound judgment which is an attribute of unparalleled usefulness.

Let me, however, warn readers not to imbibe all that is written as if it were established truth. I have no wish for them to do so in the present case. No writer has yet given proof of infallibility, and however true his statements and correct his methods, the dissimilarity of circumstances must be considered. Scientists recognise as an axiom that the like conditions will give the like results, but there is often a difficulty in ensuring precisely the same conditions. "Slowness of belief and mistrust are the sinews of wisdom," is an aphorism I would commend. To follow the methods of another implicitly is folly, but to experiment cautiously in that direction is the height of wisdom.

That is undoubtedly the safest attitude to adopt on the question of theory and practice—to learn as much as possible by theory, and at the earliest opportunity verify it by practice. It is by carefully blending the two that successful gardening is evolved. The man who loads his mind with theory without proving it by practice will find himself in a deplorable muddle. The dreamy theorists and the severe practitioners are the two extremes between whom lies virtue—and horticultural success.

William F. Rowles.

Rock Garden.—This, where it is a success, will continue beautiful and interesting. Primulas, ramondias, saxifragas, achilleas, potentillas, geraniums, dianthuses, and a host of other flowers follow each other in good succession. Keep a close watch on all, so that nothing becomes damaged or killed by its stronger-growing neighbours, or is allowed to suffer through droughts. The meconopsis are not proving quite so robust as we had hoped. Of M. integrifolia we have lost all our stock.—E. F. H.

Tulipa biflora major.—One of the earliest of my tulips this season has been the one known as Tulipa biflora major, a many-flowered variety of the Two-flowered Tulip, T. biflora. It came into flower very shortly after T. Kaufmanniana, and this, though it was established in a half-shaded position, while the other was in a more open and sunny part of the garden. Indeed, I was quite surprised when I came upon it rather unexpectedly towards the end of March, as I little expected it quite so early after such a cheerless and wet winter. No one can call this a showy tulip, as its flowers are small, white, with a yellow eye in the interior, and of a greenish-brown outside. The number of flowers on the stalk varies from two to four, and it is a most interesting plant in many ways, not the least because it, and the typical T. biflora, are said to be the connecting link between two classes of tulips, the true Tulipa and the section Orithyia. This variety has not been long in cultivation, but the type was introduced in 1806 from the Caucasus.—S. Arnott.

TULIPS AT COLCHESTER.

To those who visit the exhibitions and meetings held in May, or who read our reports on these gatherings, it is a matter of common knowledge that Messrs. R. Wallace and Co., of Colchester, have for many years past devoted special attention to the tulips flowering during that month, and contributed materially to the high degree of popularity to which they have so worthily attained. It will, therefore, not be necessary in recording our impressions of the magnificent display in the nurseries and grounds of the firm when we had an opportunity of visiting them just previous to the Temple Show, to refer to the work Messrs. Wallace have accomplished in connection with the popularisation of the cottage and other tulips that bloom at the same time. It will suffice to say that they have constantly kept a sharp look-out for varieties possessing a high order of merit, they have added them in liberal numbers to their comprehensive collection, and grown them successfully, and presented them to public notice in such manner as to enable visitors to form a correct estimate of their merits, as compared with well-known varieties in similar lines of colour. In this way they have rendered services of much value in connection with garden tulips. With a clear impression of the large collection of finely-grown tulips the firm has shown during the past season, as in previous years, we are disposed to place a very high value on the work they have accomplished in bringing before cultivators the many beautiful tulips that are now in cultivation.

The comprehensive collections that annually form such conspicuous features at the spring shows will have given the proof of Messrs. R. Wallace and Co. as large cultivators of tulips; but one can only obtain an adequate idea of the extent of the culture by a walk through those parts of their extensive grounds that are devoted to tulips. We shall not enter into details as to the numbers grown, but as the collection comprises several hundred varieties, and the majority of these are represented by thousands of bulbs, it will not be difficult to understand that many acres are occupied, and that the display during the is remarkable for its effectiveness. May-flowered tulips may, for convenience of reference, be divided into three sections, the first to comprise the cottage, the second the Darwins, and the third the species which, broadly speaking, bloom during March and the two following months.

The most important of the three sections is that comprising the cottage, or May-flowering varieties, and as one walks through the quarters, notebook in hand, it is easy to resist the temptation to make somewhat lengthy selection. Possibly may have made note of more varieties may be considered necessary for any garden. To those who may be of opinion we would say they are all highest merit, and that a selection readily made from those enumerated ing those giving the colours for which is the greatest preference. Highly tive in the collection was Afterglow, a of the largest size and of fine form, and colour deep golden-yellow, passing to son-bronze with age; Cardinal Manning handsome flower of a rose-violet hue, valuable for its distinct colour; Coronation Scarlet, a strong-growing variety, with elegantly shaped rich scarlet flowers; Don Pedro is a handsome dark flower, the colour purple-maroon, shaded bronze, and valuable for the fine contrast it gives to the brighter shades; Eurasian, a tall grower, bearing elegant flowers, attractively coloured reddish-pink, shading at the margin with yellow, is at once distinct and good; Flame well deserves its name; the flowers are large and the colour orange-scarlet, brilliant in hue, and very effective; Glaucopis is a charming little tulip, the colour bright rose with blue base; Hammer Hales is one of the most effective varieties in the section, the flowers are large, and the colour bronze-yellow; Inglescombe Pink, Inglescombe Scarlet, and Inglescombe Yellow form a trio of quite exceptional value; they all have flowers remarkable for their large size and fine shape, and the colours are indicated by the names. Very distinct and pleasing is Innovation, the flowers large and finely formed, lightly flecked with carmine on a cream-coloured ground: John Ruskin, apricot, flushed with rose, is worthy of the distinguished name it bears: Kathleen is a lovely pale yellow flower: La Merveille has large flowers with petals that elegantly reflex, as in Tulipa retroflexa, and the colour is bright coral-red, shaded rich apricot; Mrs. Moon, rich yellow; Orange Beauty, deep red-bronze; Primrose Beauty, pale yellow, are of much merit in their respective lines of colour. Scarlet Emperor must be mentioned as one of the very finest of the scarlet tulips flowering in May: The Fawn, a distinct variety, the flowers of large size and superb form, and the colour fawn with deep yellow shading; and Walter T. Ware, a superb flower of a rich golden hue. The last-named received the distinction of a F.C.C. from the Royal Horticultural Society at the last Temple Show.

The Darwins now constitute a large group, and it is satisfactory to have evidence of their continuously increasing popularity. There is in all of them some formality in shape, a characteristic that strongly appeals to those who have a proper appreciation of perfection of form, but in no case is the formality such as to detract from their charms, even in the eyes of the most æsthetic of the admirers of the tulip. The large, finely formed flowers of the Darwins produce a fine effect in the garden, and are extremely beautiful when lightly arranged in rather tall vases for indoor decoration. Anthony Roozen, one of the earliest of the section, has deep rose-coloured flowers, with a blush margin to the petals; Clara Butt, rich rose-pink, may be described as the finest in its colour in the section; Claude Gillot, glowing vermilion, is very effective; Mr. Farncombe Sandars is the finest of the crimson Darwins, and is well shown in the foreground of the illustration of tulips at Colchester; Fra Angelico, dark maroon, is remarkable for its depth of colouring and fine form; Hippolyte, bright lilac, is valuable for its distinct and pleasing shade; King Harold, rich ruby-crimson, has flowers of superb form and exceptional size, and must be described as one of the very best; La Tulipe Noire also has flowers of fine form, and the dark black-maroon is valuable for contrasting with lighter shades; Margaret is a medium-sized flower, of a soft rose colour, and exquisitely beautiful; Mellicette, lilac; Millet, deep crimson; Professor Rawenhoff, cherry-red; Suzon, pale pink, Van Poortvleit, rich rose; and Zulu, purple-black, are also exceptionally meritorious.

Messrs. R. Wallace and Co. grow the major portion of their tulips in their extensive grounds on the east side of the railway, and therefore in the direction of the town of Colchester. They also grow a comprehensive collection in an enclosed garden near the offices on the west side of the railway, for the convenience of visitors who may wish to see the varieties with as small an expenditure of time as possible. We give herewith an illustration of a corner of the garden, and in this the variety in the foreground is the handsome Mr. Farncombe Sandars. We might add that the cultivation of tulips, as carried out by Messrs. Wallace, is of the very best, and as one result the plants did not suffer from the adverse influences to which these flowers were this year subject until within a short period of their reaching the flowering stage.

A CORNER OF MESSRS R. WALLACE AND CO.'S GARDEN OF CHOICE TULIPS.

The variety in the foreground is Mr. Farncombe Sandars.

SWEET PEAS TO PERFECTION.—The new work, Sweet Peas and their Cultivation for Home and Exhibition, by C. H. Curtis, hon. secretary, National Sweet Pea Society, contains full information as to the selection, planting, and general management of sweet peas. The price is 1s. net (by post, 1s. 2d.), or bound in cloth, 1s. 6d. (by post, 1s. 8d.), from W. H. and L. Collingridge, 148, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

GENERAL REMARKS.—The more favourable weather of the past two or three weeks has been most beneficial to growth in all divisions of the orchid houses. The warmer divisions have undoubtedly benefited to the greatest extent, and the rapidity of growth has been the more pronounced, perhaps, because growth was more or less retarded by previous unfavourable climatic conditions. Where growths are advancing rapidly there is always a danger of their becoming drawn and weakly. Care must therefore be taken to afford ample ventilation, and all the available light should be given, taking care that the old foliage does not become discoloured or scorched by excess of sunlight. In fine, bright weather, the cattleyas and allied genera will be benefited by being sprayed overhead once or twice a day.

DENDROBIUMS, especially where grown under strong light, should be freely syringed overhead, but care must be observed to see that the foliage is permitted to become dry before the cool evening temperature is reached. Care should be taken to use rain water for syringing purposes, as hard water will be found to leave a white deposit on the leaves, which gives an unsightly appearance to the plants.

VENTILATION.—I have for years advocated ventilation early in the morning whenever there is a prospect of a bright day. There can be no doubt that early ventilation has a considerable effect on the inside temperature during the hottest parts of the day. There is an equal advantage derived also from closing early, and damping should be done at the time of closing the ventilators, and by removing the roof blinds at the earliest possible moment the humidity and light thus obtainable are not only beneficial to the plants but the heat thus obtained dispenses with a considerable amount of artificial heat. Only sufficient fire-heat should now be used to keep the temperature about normal; a warm circulation in the pipes the last thing at night is desirable, as it affords opportunities of opening the ventilators, and thus changing the atmosphere.

IN THE COOL DIVISIONS the greatest difficulty is in keeping the temperature low. I think most present-day growers have departed from the hard and fast lines of cold treatment for odontoglossums, and we are thus perhaps not so precise about the temperature rising above the normal as we used to be. In fact, where the more robust growths and larger pseudo-bulbs are found, it is impossible to produce satisfactory results at the flowering season unless more light is given to mature the greater bulk of growth, and with more light there must naturally be warmer conditions. It is a good plan during the warmest part of the year to whiten the roof with a thin permanent shading, in all cool houses excepting those with a northern aspect: This permits the blinds being taken off earlier in the afternoon, and their use later in the morning, and the plants are thus able to obtain considerable advantage from light. I find considerable benefit from syringing lightly overhead once or twice a day in bright weather; ample moisture must also be maintained in the atmosphere at all times, with a free circulation of air through the lower ventilators whenever the outside conditions permits.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PELARGONIUMS AND HELIOTROPES. —It is sometimes very difficult to know with what to clothe the back wall of a vinery or peach house, and it is not too much to say that in two or three years such a position can be made of much interest and beauty by planting pelargoniums and heliotropes. The present is a capital time to plant, and the border which the plants are to occupy should be drained well, and be filled with good turfy soil. To this add some old mortar rubble. With good plants and a little attention a fair amount of the wall space will be covered by the autumn. Water well during the growing season. The only other thing necessary is to thin out a few of the weak shoots before growth commences early in the year. I find the old Pelargonium Vesuvius, and the pale blue Heliotropium peruvianum, answer well for this purpose.

GLOXINIAS.—Plants raised from seed sown early in the year should be well looked after. By the beginning of September they should be good flowering plants. These grow best in low-roofed houses, where they can be placed near the glass and obtain plenty of light. Weak applications of guano and soot water will encourage the development of large leaves, good crowns, and abundance of flowers.

FOLIAGE PLANTS, such as caladiums, will now be in fine condition, and there will also be plenty of flowers. Streptocarpus hybrids will make very pretty groups in a moderate temperature, and they are easily cultivated. Achimenes, again, make pretty specimens when well grown, and are charming for baskets, and when well established they should be taken to the conservatory. The training of the summer-flowering climbers must have frequent attention to bring their young shoots up to the light.

FREESIAS.—Those who wish to have a succession of these flowers from December onwards should soon make preparations for potting the first lot of bulbs. The earlier they are potted the better, and the longer will be the season of growth, and, therefore, better results may be expected. Freesias are not difficult to grow, provided they have cool treatment, a sandy soil, and well-drained pots. Take care to keep the bulbs in their respective sizes, otherwise when the plants are fully grown the results will be somewhat disappointing, tall and short growths will intermingle, and half the flowers will be hidden. If the same sized bulbs are placed together a much more uniform potful of plants will be obtained, and all the flowers will show to advantage. Freesias do not require much soil, therefore I would recomment their culture in four or five-inch pots, as they are not only more useful for decoration, but I find the plants grow better. It is necessary, however, to give them frequent supplies of liquid manure when growth is well advanced, and to continue to do so until the flowers open.—T. B. FIELD, Ashwellthorpe Gardens.

THE FLOWER GARDEN.

COMPLETE THE SUMMER BEDDING as soon as possible, and do all that can be done to assist plants to become established, so as to obtain a long season of growth; anything transplanted from boxes will be greatly helped if a little shade from the fiercest rays of the sun can be given; if nothing else is procurable a few leafy boughs cut from large forest trees and stuck obliquely in the beds will give an appreciable amount of shade. See that nothing suffers through lack of moisture.

CARPET BEDDING.—Though not as popular in private gardens as it was a number of years ago, carpet bedding is still appreciated in some places, and where there are a sufficient number of beds one or two carpet beds make an agreeable change if in suitable positions. I never advocate the strictly flat or level surface, an undulating or broken one being much more pleasing, and even if all dwarf plants are used an uneven surface can be formed by mounding the soil up according to design. A level surface may also be relieved by a number of suitable dot or specimen plants; these may consist of agaves, yuccas, Grevillea robusta, dracænas, Acacia lophantha, Chamæpeuce diacantha, palms in variety, eucalyptus, acalyphas, and many others. Be careful in planting to adhere strictly to design, and lay the design down by accurate measurements, or the effect will be spoiled. Do not use a too intricate design, a bolder one being much more effective.

RAISED BEDS.—Where there are a number of raised beds in wire or other frames, of basket shape and pattern, very pleasing effects may be made by the use of trailing or creeping plants for the sides, such as ivy-leaved pelargoniums, lobelia, Phlox Drummondi, convolvulus, lysimachia, tropæolums, petunias, alyssums, etc., with freer-growing ones for climbing over the handles. Sometimes clematis are permanently planted for this purpose. The bed or basket may either be filled with mixed plants or only one or two varieties. If at a distance from the view point, and with a dark background, bright-coloured flowers should be used; if nearer to view, and in the open, mixed, or more subdued colours should be used. Where the frames of such beds are covered with ivy dig the soil away from the sides to sever small roots, or else the ivy will greatly impoverish the beds; add fresh soil, with an addition of well-decayed manure or bone-meal.

DAHLIAS.—If not already done these should be planted without further delay; if the ground has been prepared according to previous instructions, it should now be in good condition. Before planting drive a good strong stake into the ground, about six feet long, for tying the growths to; this will avoid damaging the plants later on; make the ground slightly saucer-shaped all round the plants for mulching and watering.

ROSES.—If there are any vacancies in the rose beds these, in many cases, may now be filled up by transplanting suitable plants from pots; make the soil firm all round each plant.

CLIMBERS.—Continue to pay strict attention to these, disbud where advisable or where growths are becoming too crowded; to ensure good strong flowering growths the following season I have found it advisable to disbud Magnolia grandiflora after the space has been sufficiently covered; gen two or three growths start together, and take away all but the stronger one each lead.—E. F. HAZELTON, Knowsley G dens.

HARDY FRUITS.

WORK AMONGST FRUIT TREES now require great care and attention, cially in the matter of keeping the clean and healthy, and the young gro neatly trained to the walls or wires. greenfly attacks the growth and leaves peach, use the syringe freely. A good ture of quassia extract will in most put matters right. On fine, sunny after use clean water, washing the undersi the leaves as well as the upper surfa thoroughly attended to, not much harm be done by insects. Train the leaders as be required; remove a few more useless taking care not to injure the bark. If hard to pinch, use the knife.

THINNING THE FRUIT. — This work most important, and should be taken in very early, at least as soon as it can be which of the fruits are safe, and likely wanted. I usually thin when they are the size of hazel nuts, removing a few intervals till only enough is left for the and this is made complete before the ston takes place. The crop should be regula according to the size of the variety and strength and vigour of the trees. In cases one fruit in ten square inches may left, and in others one to each square I am much against very heavy crops. A dium quantity of large, finely-flavoured f and a crop again the following year, sho be the aim.

PLUM TREES ON WALLS. — Like the peach, with us these crops are, on the m favourable aspects, very satisfactory plentifully set. The trees should be exami and all the leading shoots be made sec so that they do not get blown about storms. Greengages, as a rule, do not so freely as some other kinds. I have many years been a great advocate for ret ing plenty of young shoots at intervals all the trees, as these young growths usually duce the best fruits. These shoots may trained wherever there is room between main branches, so long as they are not crowded; some of them, after fruiting, be pruned back, and others retained.

CHERRIES.—Of these the crops are fair, and the sweet kinds will do well if get safely over the stoning period. The rellos are very promising at the present Keep a sharp look out for black fly, should this put in an appearance lose time in ridding the trees of it. To water or quassia extract will be safe very effectual if applied at the right Cherries, like the peach, fruit freely on wood, so that careful attention is nec to preserve suitable growths. The varieties fruit freely on the spurs, but year-old wood, neatly secured to the wa usually produces the finest cherries.

STRAWBERRIES.—The earliest of will now require netting, otherwise the thered tribe will quickly spoil the best I have found it a good plan to put wire ting round the beds and then fish ting over the top, this resting on a su framework that keeps the nets about above the plants. Blackbirds do not, rule, attempt to put their heads through hard wire, and, although a little costly the time, the wire will last for many if carefully rolled up and put away in convenient place till again wanted. See the strawy material is put right to the fruit from grit. Mice are sometimes destructive and troublesome; the little back traps are very useful and conven and, as a rule, if set nightly, the plague soon be reduced. The crop this year exceptionally promising, notwithstanding at one time the foliage of some sorts very brown and scorched appearance, and frosty weather catching Water several others.—H. MARKHAM, Wrotham P Gardens.

ATMOSPHERIC NITROGEN AS A FUTURE COMMERCIAL SOURCE OF PLANT FOOD.

The following admirable paper, by Mr. L. L. Van Slyke, chemist at the New York Agricultural Experiment Station, we reprint from "The Proceedings of the Western New York Horticultural Society":

You remember how in 1898 Sir William Crookes startled us all for a brief time by predicting the exhaustion of the nitrate supply of the world in about thirty years, and a prospective world famine, consequent upon the increase of population, and, sooner or later, a gradual decrease of the world's necessary food supply, unless new and abundant sources of nitrogenous plant food should be found. It was held that a cheap source of nitrogen, directly available as plant food, must be discovered in quantities sufficient to accomplish two things: (1st) To supply the place of the nitrogen taken from the soil by crops; and (2nd) to increase the power of the soil to grow a larger amount of nitrogenous food per acre than is now done.

Before that time chemists had busied themselves with the problem of obtaining nitrogen from the air for agricultural and manufacturing purposes, but without success. Modern chemistry is heir to the alchemy of olden times, when men were searching for the elixir of life, by means of which the human race could be kept perpetually young. In consequence of the transformation of alchemy into chemistry, it may be said that we have been continuing the search for an elixir of life, somewhat modified to be sure. The modern elixir of life has been sought in the atmosphere as something that would make more abundant our sources of sustenance and keep perpetual our annual harvests. Happily, the developments of the past few years indicate that the elixir of plant life can be obtained from the air, and that new commercial supplies of nitrogen are thus becoming rapidly available.

Questions are constantly being asked about these materials, and it is desirable that you should be in possession of some reliable facts regarding this important subject, instead of relying upon such accounts as may appear in newspaper and magazine pseudo-scientific articles, so often distinguished for high literary polish and statements that too often are not so.

It will be a matter of interest to consider briefly our usual sources of inorganic nitrogen compounds available for agricultural purposes, in order that we may appreciate more fully our urgent need in the near future of new sources of supply. The discussion is limited to what may be called inorganic nitrogenous compounds, because we are considering only those sources of supply that do not come from the soil itself. We do not need to consider the animal and vegetable materials that are sources of nitrogen used in agriculture, because they come from the soil itself.

The two main sources of supply of commercial inorganic nitrogen compounds used in feeding crops are nitrate of soda from Chili, and sulphate of ammonia.

Nitrate of Soda.

The present annual output of nitrate of soda is about 1,600,000 tons, of which agriculture uses about four-fifths, or 1,300,000 tons, and agricultural requirements have steadily increased rather than otherwise. The amount of nitrogen in the entire annual output of the nitrate of Chili is only about one-fifth the amount of nitrogen used by one wheat crop in the United States. Recent calculations indicate that the Chili beds will be practically exhausted by 1923, or in about fifteen years, somewhat sooner even than Sir William Crookes calculated. There has been thorough and extensive searching for other deposits like those in Chili, but none has yet been found. Deposits are known to exist in California, but they are not sufficiently rich in nitrate to pay for working, and thus far have proved profitable only to gifted promoters, who are skilful in catching human suckers desiring to reap enormous profits, while at the same time helping out agriculture. We can thus see that, so far as we now know, natural nitrate deposits hold out little encouragement for long-continued future supplies.

Sulphate of Ammonia.

Ammonium sulphate is produced as a by-product in the manufacture of illuminating gas and coke. In the past, large amounts of ammonia have been allowed to go to waste, especially in the manufacture of coke, but the present tendency is to save it. The amount of sulphate of ammonia now produced in the United States is about 60,000 tons a year, and only a small proportion of this is available for agriculture. Of the total nitrogen contained in coal, only 10 to 15 per cent. is obtained in the form of ammonia. Expressed in another form, one ton of coal produces from eight to twenty-five pounds of sulphate of ammonia, equivalent to 1.6 to 5 pounds of nitrogen. The amount of ammonia that we may hope to obtain from this source can hardly be regarded as extensive or permanent for future supplies.

Some years ago experiments were made in obtaining ammonia from the garbage of large cities, and considerable hope was felt that ammonia might thus be abundantly and cheaply produced; but the attempt appears to have been a failure, at least from a commercial standpoint.

Atmospheric Nitrogen.

It has been recognised for some time that in the future we must come more and more to depend for the nitrogen compounds required for agricultural purposes upon the inexhaustible supply of nitrogen contained in air.

The element nitrogen is chiefly distinguished for its chemical indifference and inactivity; it prefers to maintain its individuality apart from other elements and remain as free nitrogen, rather than tie up with other elements in the form of compounds. In other words, humanly speaking, nitrogen has strong tendencies to bachelorhood, and it can be enticed out of this condition only by unusual attractions or special affinities. In its uncombined state, as it exists in the air, nitrogen is useless as a plant food; at least so far as we now know. The problem is, therefore, to cause atmospheric nitrogen to combine with other elements and form compounds in which the nitrogen can be utilised by plants as food. In order to be of commercial value, a process which successfully solves this problem must produce nitrogen compounds cheaply and in large amounts.

(To be continued.)

Coccoloba grandiflora. — This, known also as Coccoloba pubescens, was admirably shown at the Ghent Exhibition, and was awarded the first prize for a specimen fine foliage plant, for which a special class had not been provided. The specimen shown was five feet high or thereabouts, and consisted of a single stout erect stem clothed with massive leaves, roundish in outline, but cordate at the base. The leaves, nearly a yard across, are of a stout, leathery texture, and disposed in an almost horizontal manner. They are set very closely to the stem, that is, without the interposition of any pronounced stalk. This coccoloba, which is botanically a member of the polygonum family, attains quite tree-like dimensions, and, though a striking plant for a large structure, will soon grow too tall for a small house. It is a native of Tropical America, hence the temperature of a stove is necessary to its well doing. Though so striking a foliage plant, and the fact that according to the books it was introduced as long ago as 1690, it is very rarely met with in gardens. The genus coccoloba is a fairly extensive one, but very few are in cultivation in this country; indeed, the ornamental qualities of most are by no means of a high order. One species, C. uvifera, is the Sea-side Grape of the West Indies.—K.

SWEET PEA JOTTINGS.

Mr. John Collingridge writes: "The notes on early sweet peas (page 434) suggest to me a note in regard to those varieties now flowering in my garden at Brentwood. On December 9 we sowed Dora Breadmore, Miss Willmott, Prima Donna, and Gladys Unwin. During the next two or three months the pots remained in a cold frame, and in the frosty weather they were removed to the greenhouse. Later they were placed in an unheated glass structure, and light twigs, about four feet in height, were inserted in the soil. On the 23rd April the plants were carefully turned out of the pots, without disturbing the sticks, and planted in the open garden; they were then about 3ft. 6in. in height.

"Hail, snow, bright sunshine, and a keen frost at night made them look very sad during the following week, but on May 27 the first flowers of Gladys Unwin opened, those of Prima Donna on the following day, and of Dora Breadmore on the 31st. The plants are now (June 5) about five feet six inches in height, and carry a goodly array of flowers, many of the stems having five blooms."

The first flowers to open in my own garden were Burpee's Primrose Spencer, Helen Lewis, Dorothy Eckford, and The Marquis. The first-named opened on June 2, from spring-sown plants, and the flowers were quite smooth; later flowers show the same smoothness, and the primrose colouring is pale.

The tornado that visited the south-western portion of the Metropolitan area, and which overturned huge lime trees, and cut a hole through the famous Chestnut Avenue at Bushey Park, paid me a visit, but its fury was somewhat abated ere Brentford was reached. I quite expected to find my sweet peas all laid out flat upon the ground, but so tightly do the tendrils grip the twigs, and so useful is the support that a few ties of raffia afford, that no harm was done. And yet I am not quite sure that the sweet peas were all unharmed, because unless I attribute the failure of a clump of Mrs. Collier to the action of the storm, I am left without explanation of the behaviour of the variety since then. I fancy the growths were so strained by the wind that they have not yet recovered; anyhow, the plants look so unhappy that I shall most likely pull them up and plant later seedlings of another variety.

A tale of woe reaches me from Lincolnshire and Cambridgeshire, where there seems to have been a perfect plague of slugs. Two well-known growers settled the account of 2,000 slugs one evening on about 40 yards' run of choice sweet peas, and the following evening 1,000 slugs were caught on the same row. In another garden women have been specially employed catching slugs on the sweet pea plots, and, in spite of these and other precautions, the loss of several seedlings that promised well last year, has to be deplored.

In Essex the sweet pea enthusiasts are looking eagerly for the small cloud—like unto a man's hand—that gives promise of abundance of rain. In the south, in those districts where little or no rain has fallen lately, sweet peas are rushing into bloom, and consequently free growth has been checked. Watering, surface hoeing, or mulching, and feeding with nitrate of soda, are matters occupying the attention of those who have not been visited by Jupiter Pluvius.

Mr. Chas. Foster tells me that unless they have a good rain at Reading, and very soon, the sweet peas will not be so tall or fine as in 1907, and, notwithstanding the late spring, the chief display of bloom will be earlier this year than last.

Welsh and Scottish growers are keeping very quiet. Perhaps they are chuckling over the difficulties of the Southerners, and quietly making stands and cases for the Eckford, Sutton, Burpee, and Edwards Cups.

Respecting the Colour Chart for sweet peas, my recent letter in reply to the one from Mr. Stanley Brook has given rise to a great deal of comment. I am not at liberty to write further on this subject now than to ask those who are specially interested in the matter to "bide a wee." Chas. H. Curtis.

BECKENHAM HORTICULTURAL GRAND SUMMER SHOW (open). WED., July 8.
Special Rose Classes, Table Decorations, etc.
3 Military Bands, Pastoral Play, Naval Display, etc.
T. W. THORNTON, F.R.H.S., Hon. Sec.
The Library, Beckenham.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.—TWENTIETH ANNUAL SHOW, SOPHIA GARDENS, CARDIFF, Wednesday and Thursday, July 22nd and 23rd, 1908.
Liberal Prizes for all sections.
Silver Plate, Cups, and Medals.
Every facility given to the Trade. Schedules free.
Mr. A. MAURICE BAILEY, Secretary,
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
July 1st and 2nd, 1908.
TWELFTH GREAT ANNUAL FLORAL FETE.
£650 IN PRIZES. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for
"TRADE EXHIBIT"
(for particulars see page 10 in Schedule).
Valuable SPECIAL PRIZES offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.
Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

RICHMOND HORTICULTURAL SOCIETY.
The 34th ANNUAL SHOW
Will be held in
THE OLD DEER PARK, RICHMOND, SURREY,
on
WEDNESDAY, 24th June 1908 (Entries close 17th).
Schedules and all particulars from
W. J. COOK, Hon. Sec., Holmsley House, Richmond, Surrey.

SOUTHEND HORTICULTURAL SOCIETY ANNUAL EXHIBITION in the WINTER GARDENS, PALACE HOTEL, SOUTHEND-ON-SEA, on TUESDAY and WEDNESDAY, July 7th and 8th, 1908.
Entries close July 1st. For Spaces, Schedules, and all particulars, from E. A. WATTS, 12, St. Vincent's Road, Westcliff-on-Sea.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

JUNE 9.

Although the above date was only a fortnight after the Temple Show, and was also the day after Whit Monday, there was little or no falling off in the extent of the exhibition held at the Royal Horticultural Hall. The display was a trifle monotonous, however, as so many exhibitors staged pyrethrums, poppies, and aquilegias. Orchids were fairly good, and included some choice novelties.

FLORAL COMMITTEE.

Mr. Amos Perry's contribution of hardy flowers, from Enfield, was a fairly large one; the display was an effective one, and Oriental poppies were a leading feature; there were groups of hardy geraniums in variety, and also of irises, the latter including the handsome I. Susiana. Mr. Perry also showed an interesting collection of hemerocallis. Verbenas were finely shown by Messrs. H. B. May and Sons, Edmonton, the glowing salmon-red Juno, the blue Princess of Wales, the pink Miss Willmott, the blue, white-eyed Florence, and the white Queen of Whites, were all finely represented, and associated with standard heliotropes, abutilons, and the newer nephrolepis. In the group we noticed a plant of the old and interesting Combretum purpureum. Single and double pyrethrums, arranged by Mr. Maurice Prichard, Christchurch, made a brave show in association with heuchera and gypsophila. Other things well shown by Mr. Prichard were Incarvillea Delavayi, some beautifully spotted foxgloves, poppies, and German and Siberian irises. The Misses Hopkins, Mere Gardens, Shepperton, had a small rockwork display, in which saxifragas and dianthuses figured largely.

A group of elegant and large examples of a good strain of schizanthuses was set up by Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield, and with these were set up a dozen very large plants of Rehmannia angulata, one carrying over a dozen spikes. Long-spurred aquilegias in variety were contributed by the King's Acre Nursery Company, Hereford, and their group of these elegant flowers was flanked by smaller groups of lupins, dianthuses, hemerocallis, and other hardy flowers.

Pyrethrums, both single and double, were largely shown by Messrs. R. H. Bath, Lim., Wisbech; their bright flowers were very attractive, especially the new bright pink single variety named Favourite. Messrs. Gilbert and Son, Dyke, Bourne, Lincs, brought up bunches of the lovely King of Scarlets anemone, some St. Brigid varieties, and a few aquilegias. Messrs. Dobbie and Co., Rothesay, submitted a very fine lot of fancy pansies, beautiful blooms of perfect form and rich colouring; and a beautiful set of violas. Of the latter we feel constrained to say that the blooms were too large, approaching too nearly to the pansies.

A lovely lot of carnations, gracefully set up in tall glasses with Asparagus Sprengeri, by Mr. C. F. Waters, Balcombe, Sussex, was greatly admired; Mrs. H. Burnett, Helen Goddard, Britannia, Mrs. T. W. Lawson, Robt. Craig, Floriana, and Enchantress, were the leading varieties. Messrs. Carter, Page, and Co., London Wall, E.C., had a pretty display of early and bright cactus dahlias, a few annuals, and a good strain of antirrhinums. A group of gorgeous cannas, all superbly grown single-stemmed plants, carrying grand spikes of large and brilliant flowers, was set up by Messrs. H. Cannell and Sons, Swanley, Kent. Such varieties as Niagara, Elizabeth Hoss, Frau Moritz, M. de Raynal, Wm. Tell, and Oscar Dannecker, were grand, and attracted a great deal of attention.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a large exhibit of cut perpetual carnations, Malmaison carnations in pots and carrying good blooms, blue and white hydrangeas, gerberas, very handsome specimens of Metrosideros floribundus, and the pink Spiræa Queen Alexandra. Another large display of hardy flowers was the one made by Messrs. G. and A. Clark, Dover, who showed pyrethrums extensively; they also had Eremurus robustus, handsome Oriental poppies, and a very bright lot of German, Siberian, and Spanish irises. Mr. S. H. Street, gardener to J. A. Young, Esq., Stone House, West Hill, Putney, showed some well-grown gloxinias, some of the plants carrying over two dozen blooms; a batch of dwarf, freely flowered calceolarias was also shown by Mr. Street.

The lovely hardy calceolaria Golden Glory was well shown by Messrs. Robert Veitch and Sons, Exeter, who are the distributors of this fine novelty; they also showed spikes of Buddleia Colvillei and Lathyrus pubescens, and plants of Rehmannia angulata Pink Perfection; a grand strain of the old English Brompton stock, of crimson hue, named Veitch's Magenta (A.M.), was also shown by the Exeter firm. Mr. Jas. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, also showed Calceolaria Golden Glory, bringing up half a dozen beautiful plants in pots, covered with rich golden blooms.

Messrs. J. Kelway and Son, Langport, contributed a glowing display of their pæonies, pyrethrums, and delphiniums, and among the pyrethrums their new and brilliant Langport Crimson (A.M.) arrested attention. The lovely pink-tinted spiræas, Queen Alexandra and Peach Blossom, were exhibited by Messrs. G. van Waveren and Kruyff, Sassenheim, Holland.

Messrs. Jas. Veitch and Sons, Chelsea, were extensive exhibitors, staging a beautiful lot of very fine gloxinias, both self and spotted and shaded varieties, Cypripedium spectabile, Meconopsis aculeata, and Primula Cockburniana. In another group the Chelsea firm had a selection of long-spurred aquilegias, beautiful plants of the brilliant blue chusa italica Opal, and A. i. Dropm a batch of schizanthuses, beautiful tufts, and other annuals. Some giant standing about 8ft. high, and clothed flowers, were set up opposite the ent Messrs. Jas. Veitch and Sons; Brilliant, Bright, Clipper, Charming, Lye's Fav and Lady Jane Wilson were the var staged. Rosa Moysi (A.M.), from Chi very spiny species, with rounded, deep red substantial flowers; and Deutzia W (A.M.), with large white flowers freely produced in short-branched spikes, were also shown by the Messrs. Veitch.

Mr. G. Reuthe, Keston, Kent, was a exhibitor of hardy flowers, irises, lupins, poppies; Rhodothamnus kamtschaticus (A. and rhododendrons, with Embothrium cineum showed up well. Mr. R. C. Notcutt, Woodbridge, submitted a goodly lot of hardy flowers, but rather crowded his bunch Messrs. Paul and Son, Cheshunt, pretty pillar plants of Goldfinch, Tr other rambling roses, as well as an ment of flowering shrubs and a group roses, the latter including several newer varieties. Mr. F. T. Patmore, ington, showed German irises and Messrs. Wm. Bull and Sons, Chelsea, group of stove and greenhouse foliag

Rockery and alpine plants were s Messrs. J. Peed and Sons, West Norwood; the same firm had a very fine lot of sing double pyrethrums, and a brilliant Oriental poppies, lupins, and German A very showy group of hardy flowers ranged by Messrs. George Bunyard and Maidstone; the German irises were very and the pyrethrums excellent, but pink spiræas, the lupins, and the Or poppies were the chief features.

In Messrs. Wm. Cutbush and Son's from Highgate, the new pink spiræa well shown, as were the new and handsome Coleus Cordelia, Rhododendron Pink Pearl, and perpetual carnations, such as White Perfection, Enchantress, Mrs. T. W. Lawson, The President, The Pasha, and Cecilia

The beautiful new pink Lupin polyp roseus was finely shown by Messrs. J Cheal and Sons, Crawley; this is a hardy plant. Some beautiful carn blooms, notably Enchantress, Robt. C Marmion, and Britannia were shown H. Burnett, Guernsey, who also had tw varieties, Vulcan and Snowball (A.M.), latter a fine white, obtained by cr border with a tree carnation.

A glorious new bearded iris, named I thusiana, bearing tall spikes of very pale-blue flowers, that are veined deeper blue, and have a yellow crest fall, as well as yellow-brown mark wards the base of each fall, was shown J. W. Marshall, Charterhouse, Godalming, and gained an A.M. Zephyranthes aurea (A.M.), with brilliant golden-yellow flowers, was shown by Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, and from the same source came Deutzia Lemoinei Rosace (A.M.), a very large semi-double, creamy-white variety of great beauty.

Messrs. Bakers, Codsall, Wolverhampton, set up a very showy group of Oriental poppies, together with aquilegias, pæonies pyrethrums. Messrs. G. Jackman and Woking, showed hardy flowers exten and Mr. R. Neal, Wandsworth, sent a moderately good sweet peas.

ORCHID COMMITTEE.

Mr. E. May, gardener to J. B. Jo Childwickbury, St. Albans, showed a plant of Cypripedium Rothschildeanum thaw House var., carrying five spikes, one carrying seven flowers, and others five and six flowers apiece. A commendation was worthily awarded Stables, gardener to De Barri Cr Esq., Sevenoaks, showed a group of odontoglossums, but O. Queen Alexandra Crawshayana, a round-flowered and richly-hued cross between O. Harryanum and O triumphans, gained a F.C.C., and was the gem of the collection; O. crispodenei, O. Tristan.

O. Astarte, and O. Crawshayanum were other beauties. Mr. C. J. Salter, gardener to W. Cobb, Esq., Rusper, Horsham, sent a fine plant of Cattleya Martineti Dulcotense, with seven lovely flowers. M. Maurice Mertens, Mt. St. Amand, Ghent, showed a small group of choice odontoglossums.

Mr. Stevens, gardener to W. Thompson, Esq., Stone, Staffs, exhibited a group of miltonias, and among them the light-coloured, free-flowering, and very pretty M. Stevensi was especially good; it gained a F.C.C. Another good Miltonia was M. St. Andre, derived from M. Roezli and M. Bleuana splendens (F.C.C.); it has bold flowers, white, with rosy bases to the petals, and a bright brown, radiating blotch at the base of the lip. This was shown by Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham, who also sent Odontoglossum Phœbe, The Dell variety (F.C.C.), a most beautiful form of the cross between O. cirrhosum and O. crispum. Messrs. J. and A. McBean, Cooksbridge, Sussex, showed some very fine odontoglossum spikes, O. gloriosum citrinum (A.M.), Cattleya Reineckiana, and C. Mossiæ Jaffa.

Messrs. Charlesworth and Co., Heaton, Bradford, set up a rather small group of choice orchids, and once again each plant was a good specimen. Here were Læliocattleya G. S. Ball, L.-c. Canhamiana, L.-c. C. alba, L.-c. Dominiana magnifica, L.-c. Bertha Fournier, Odontoglossum amabile Othello, and the brilliant Renanthera Imschootiana. Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a large group of orchids, the whole making up an attractive display; the odontoglossums arching over the varieties of Cattleya Mossiæ, C. Mendeli, C. Skinneri, and various cypripediums, were very pretty.

In the orchid group submitted by Messrs. Sander and Sons, St. Albans, we noticed good plants of Lælio-cattleya Canhamiana, the quaint Habenaria Suzannæ, Renanthera Imschootiana, Lycaste lanipes, Cypripedium bellatulum, and Odontoglossum Loochristiense. Mr. A. W. Jensen, Lindfield, Haywards Heath, showed a small group of orchids that included some pretty forms of C. Mossiæ, Odontoglossum crispum, O. hastilabium, and Oncidium Kramerianum, the butterfly orchid.

A large group of varieties of the beautiful and useful and variable Cattleya Mossiæ was set up by Messrs. Stanley and Co., Southgate, N. Among the many varieties this group contained we were specially struck with C. M. Thompsoni, a pale peach-pink variety with prettily fringed lip and soft yellow, purple-marked throat; C. M. Mrs. Reginald Smith, with broad purple and gold lip; C. M. Aurora, with a curious purple, bronze-shaded lip; C. M. Lord Avebury, of lovely shape and open lip; C. M. Ophir, with a lot of yellow in the lip, C. M. Elaine, with a white frilled lip; C. M. eburneum, a pretty, light form; C. M. Lady Plowden, with open, rounded lip of bright gold and purple; and C. M. flammea and C. M. Niobe, both of excellent form, the former having a very dark lip. Messrs. Stanley and Co. also had a good batch of Cattleya Acklandiæ.

FRUIT AND VEGETABLE COMMITTEE.

Pot fruit trees were well shown by Messrs. Jas. Veitch and Sons, Chelsea, their figs being particularly well done, and carrying splendid crops; the peaches were also excellent and heavily fruited. Mr. S. Mortimer, Rowledge, Farnham, showed two good new cucumbers named Evergreen and Faultless, the latter a cross between Market Rival and Improved Telegraph.

CERTIFICATES AND AWARDS.

First-class Certificate. — Odontoglossum Phœbe, Dell var., and Miltonia St. Andre, from Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham; Odontoglossum Queen Alexandra Crawshayana, from Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks.

Award of Merit.—Miltonia Stevensi, from Mr. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone, Staffs; Zephyranthes aurea and Philadelphus Lemoinei Rosace, from Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; Carnation Snowball, from Mr. H. Burnett, Guernsey; Rosa Moysi and Deutzia Wilsoni, from Messrs. Jas. Veitch and Sons, Chelsea; Rhodothamnus kamtschaticum, from Mr. G. Reuthe, Keston; Stock Veitch's Magenta strain, from Messrs. R. Veitch and Son, Exeter; Pyrethrum Langport Crimson, from Messrs. Kelway and Son, Langport, Somerset; and Iris Carthusiana, from Mr. J. W. Marshall, Godalming.

MEDALS.

Gold.—Messrs. Jas. Veitch and Sons, Chelsea.

Silver-gilt Flora.—Messrs. Wm. Cutbush and Son, Highgate.

Silver-gilt Knightian.—Messrs. J. Veitch and Sons, Chelsea (for pot fruit trees).

Silver-gilt Banksian.—Messrs. Kelway and Son, Langport; Mr. M. Prichard, Christchurch; Messrs. Paul and Son, Cheshunt; Messrs. G. Bunyard and Co., Maidstone.

Silver Flora.—Mr. G. Reuthe, Keston; Messrs. R. H. Bath, Lim., Wisbech; Messrs. H. Cannell and Sons, Swanley; Messrs. G. and A. Clark, Dover; Messrs. Hugh Low and Co., Bush Hill Park, Enfield (one for carnations and one for orchids); Messrs. H. B. May and Sons, Edmonton; Messrs. J. Peed and Son, West Norwood; Mr. A. Perry, Enfield; Messrs. Sander and Sons, St. Albans; and Messrs. Charlesworth and Co., Heaton, Bradford.

Silver Banksian. — Messrs. J. and A. McBean, Cooksbridge; Messrs. Stanley and Co., Southgate; Mr. A. Jensen, Lindfield; Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks; Messrs. Bakers, Codsall, Wolverhampton; Messrs. G. Jackman and Son, Woking; Mr. H. Burnett, Guernsey; King's Acre Nursery Company, Hereford; Mr. C. F. Waters, Balcombe.

Bronze Flora.—Messrs. J. Cheal and Sons, Crawley.

Manchester.

JUNE 3, 4, and 5.

The annual show of the Royal Botanical and Horticultural Society of Manchester was held at the White City, in the Skating Hall.

The exhibits showed a considerable falling off both in quantity and quality from previous years, many of the leading exhibitors of other times failing to put in an appearance. This is to be regretted when we remember the magnificent shows that have been held in these famous gardens.

For a collection of orchids in bloom Mr. J. Robson, Altrincham, was placed first with the only exhibit, a bright combination in which good dendrobiums, lælias, odontoglossums, and cypripediums were staged. For a collection of odontoglossums, amateurs, Mr. A. Dagleish, gardener to A. Warburton, Esq., was to the fore with good spikes of good types. For a large group of miscellaneous plants, arranged for effect, amateurs, Mr. J. W. Smith, gardener to James Brown, Esq., had the premier collection, in which lightness and variety were noticeable. Arches and pillars of roses, with good palms and crotons and well-grown verbenas, were staged in an effective manner. Mr. W. B. Upjohn, gardener to the Earl of Ellesmere, was second, his group including pyramids of Miltonias. For the smaller group of not less than 100 square feet, Mr. W. Jones, gardener to J. E. Williamson, Esq., was first.

Mr. W. J. Cookson, gardener to J. Duckworth, Esq., led for six foliage plants, and Mr. H. Brocklehurst, gardener to A. R. Kelly, Esq., was second. Mr. J. W. Smith had the best collection of roses, showing bush plants well. For six exotic ferns Mr. J. Holt, gardener to P. Smith, Esq., was first; Mr. W. Simons, gardener to F. M. Aitken, Esq., following. Mr. G. Doyle, gardener to Mrs. E. Wood, had the best eight dinner-table plants. Mr. J. Eaton, gardener to D. Pearson, Esq., led with cinerarias. Mr. J. W. Smith took the lead for twelve calceolarias, and for twelve gloxinias Mr. J. Holt scored.

For a collection of not less than thirty hardy herbaceous and alpine plants, Mr. J. Holt won with an interesting collection. Other leading prize-winners were Mr. A. Parr for hardy ferns; Mr. J. Holt for six adiantums; Mr. W. Cookson, gardener to John Duckworth, Esq., for begonias; Mr. J. Holt for pansies; Mr. S. Pearson for coleus; and Mr. W. Cookson for caladiums.

Mr. D. McLeod was awarded a first-class certificate for an odontoglossum. Messrs. Frank Dicks and Co. exhibited palms with other stove and greenhouse plants, and Mr. Thomas Darlington showed sweet peas, etc.

Gardening Competition in Fifeshire.

A most interesting gardening competition in Cupar, Fifeshire, held under the auspices of the Edinburgh and East of Scotland College of Agriculture, and the Fifeshire Education Committee, has just been completed by the issue of the prize list. Mr. G. P. Berry, County Council Lecturer, conducted a large and intelligent class during the past season, and at the close elaborate and exhaustive papers were set. The competition was divided into three sections—one for professional and market gardeners, another for amateurs and cottagers, and a third for ladies.

In the professional section the competitors were asked to describe the best methods of laying down in the open an acre of fruit—apple, pear, and plum—with under-planted small fruit, giving the most up-to-date cultural treatment over a period of six years. Also, the most approved cultural details in the growing of first early potatoes, early and late cauliflowers, and onions for bulbing purposes, in a private garden. The amateurs and cottagers were asked how they would lay out a small piece of ground as a cottage garden taken in from old pasture land, including soil working, manuring, cropping, propagating, planting, and pruning; also the best method of cultivating roses in a small garden.

The problem set the ladies was to give their views on the history and culture of the sweet pea, emphasising its adaptability for decorative purposes inside the villa and mansion; also to give their ideas with regard to arrangement of flower foliage in vases and for table decoration.

The competition was entered into most enthusiastically, and a large number of most excellent papers was the result. The chief awards were made as follows:

Professional and Market Gardeners.—1 (silver medal), Mr. David Dalrymple, Dura House: 2, Mr. Peter Walker, Cairnie; 3, Mr. Robert Thomson, Clatto; 4, Mr. Daniel McGregor, Floxton.

Amateurs and Cottagers.—1 (silver medal), Mr. W. Oliphant, Bonnygate; 2, Mr. Charles Storar, architect, East End Park; 3, Mr. R. Halley Robertson, bank accountant, Hope Cottage; 4, Mr. Robert Dalgleish, architect, Bonnygate.

Ladies.—1, Miss Innes, Rosemount; 2, Mrs. E. M. Lennox, Castlefield; 3, Miss Mary Honeyman, Eden Villa; 4, Miss Honeyman, Eden Villa.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

GOOSEBERRY MILDEW.—M. R. C., Gloucester: The present month is one in which the summer stage of the American gooseberry mildew may appear, though the season of infection is from May until October. On the first sign of infection spray with sulphide of potassium at the rate of ½lb. to 16 gallons of water. Write us again when the leaves fall. By the way, the sulphide of potassium solution should be used every ten days after the infection is noticed.

LAWN MOWINGS AS PLANT FOOD.—Cornishman: The conversion of lawn mowings into plant food on the lines of leaves being converted into leaf-soil is practically impossible owing to the great heat the grass generates when in bulk. In the case of the leaves the moisture has largely gone ere they fall, and so decay is steady, and fierce heat is not generated in the process of decay. In the form of mulchings lawn mowings may be used advantageously for many crops, as it reduces evaporation from the soil and keeps the roots cool, and in due course is incorporated with the soil, adding humus to it. Failing its use this way, and also the usual method of decay in the rubbish heap, we recommend it be burnt in a slow fire with thin layers of soil, to form burnt earth that is valuable for many purposes where a potassic fertiliser is needed.

ASPARAGUS.—"E. A. L., Farnham," asks what is the best time of day for gathering asparagus. He is under the impression that the flavour of the produce varies somewhat, according to the time of the day in which it is cut. It is so usual to serve the kitchen as soon after breakfast as possible that few, perhaps, have taken special notice of how asparagus tastes that is cut, say, in the afternoon, after the sun has been shining for several hours on the bed. If any of our readers have made observations relative to this question we shall be glad if they will send us the results of such observations.

EARLY STRAWBERRY LAYERS.—G. R. N., Cirencester: Now that the plants set out for the production of early runners have shown flower, remove the flower spikes, and if any specimens have not shown flower spikes dig them up and burn them at once. Have the requisite number of sixty-sized pots made ready, and filled with moderately light rich soil, made firm, and then peg one layer into each pot as soon as the opportunity for doing so presents itself.

LILIUM CHALCEDONICUM.—T. S. B., Torquay: This useful lily, like many others of its particular group, loves good soil that is enriched with leaf-mould; a position that is well drained, but never really dry; and a site where the plants are slightly shaded from the midday sun. The bulbs should be planted six inches deep, and a foot apart. Under such favourable conditions they grow readily, multiply freely, and bloom finely. Your non-success is due, perhaps, to poor position or soil, or to damage received during the autumn clearing-up process; all too many bulbs are damaged at such occasions. We may help you better if you let us know the conditions under which you have endeavoured to grow L. chalcedonicum.

DARK-COLOURED LILACS.—T. S. B., Torquay: Charles X. is a very fine lilac for many purposes, and one difficult to beat. We are fond of the bold Souv. de Leon Spathe, which bears big spikes of deep red-purple flowers. Other good dark single lilacs are Louis Van Houtte, deep red; Ville de Troyes, purple-red; Madame Briot, rose-purple; Rubra de Marley, rose-purple; and Charles Joly, red.

ASPIDISTRAS.—A. J. F., Muswell Hill: The specimen has been newly made up and subjected to strong heat, and hence was not a suitable one for you to use in a room. Placed in a stove it would have become well rooted, and then, after a little hardening off, would have been very useful and serviceable. It is not usual to send out specimens so newly made up, nor is it usual to cut up the rhizomes into quite such short lengths as in your case. A contributing cause of failure is the use of too much water while the plant was so poorly rooted. Remove all the soil, wash the roots and rhizomes clean in soapy water, cut away diseased portions, and then repot in small, well-drained pots, in a light sandy compost. Place the newly-potted plants in a stove or warm house, in a moderately shaded spot, and give only sufficient water to keep the soil moist until new roots have formed, when more water will be needed. The next time you buy a plant turn it out of its pot first to see whether or not it is well rooted.

SWEET PEA CELESTIAL.—M. S. H., Devon: The name Celestial was given to a sweet pea sent out some years ago by Mr. Charles Lorenz, a German seedsman. It had a light mauve standard and lavender wings. The variety has now gone practically out of cultivation, if not absolutely so; and, in any case, it is not considered to be of sufficient merit for modern growers. In the National Sweet Pea Society's Catalogue of Sweet Pea Names Celestial is given as an old variety. However, you should not use the name for a new variety, as this would, in all probability, lead to confusion.

SEED PODS ON AZALEAS AND RHODODENDRONS.—M. W. B., Tavistock: The formation of seed pods and the ripening of seeds does most certainly tend to reduce the vigour of rhododendrons and azaleas, and this is more noticeable on some kinds than others. In the case of great masses of the ponticum and common garden forms, where general effect only is desired, there is no real need to remove the seed pods, but in the case of choice varieties as specimens or in beds near the mansion, the removal of seed pods at as early a date as possible should always be practised. This removal allows the growths that rise close to the old flower truss to develop strongly, and form flower buds that will give a fine display the following year. A smart lad, if shown exactly what to do, and how to do it, will be able to do a large amount of work of this kind in a few days. It is worth while explaining to him how much good his work will accomplish, and also how much harm he may do if careless.

INSECT PESTS ON ROSES.—W. T., Southend: You can have nothing better than the little book entitled "The Enemies of the Rose," published by the National Rose Society. It is obtainable only through a member of the society, and its price is 2s. 6d. There are numerous illustrations, coloured and half-tone, of diseases and insects. Remedies and preventives are given in each case.

COLOURED FLIES.—G. W. Fakenham: The pretty flies sent are known as Hover flies, because of the curious manner in which they hang in the air, "hover," over a leaf, flower, or colony of green or black fly. They should not be destroyed, as they are friends, and not enemies. Hover flies deposit their white eggs in the colonies of aphides, and when the unpleasant greenish-grey maggots have hatched out they at once attack the aphides, and, as they have enormous appetites, the way they dispose of the gardener's enemies is a real treat to watch. No; don't kill the hover flies, except it may be a specimen or two for preserving in an air-tight case, so that they may be shown to growers who do not know friends from foes.

PACKING FRUIT FOR MARKET.—H. H. J., Cambridge: The Gold Medal Essay written by Mr. R. L. Castle for the Worshipful Company of Fruiterers, appears to us to be just the sort of work you want. It conveys the desired information in an admirable manner, and it is illustrated. It also deals with packing vegetables. The book is 1s. 3d., post free, from W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C.

NAMES OF PLANTS.

C. O. H., Leek.—Trachelium cœruleum.

D. H. A., Ashby.—1, Incarvillea Delavayi, 2, I. grandiflora.

F. E. G., Truro.—Gaylussacia (or Vaccinium) frondosa.

S. N., Barnet.—1, Oncidium Marshallianum; 2, O. concolor.

J. F., Suffolk.—The pretty double yellow Rocket, Barbarea vulgaris fl.-pl.

D. W., Hayes.—1, Pæonia decora; 2, Caragana arborescens; 3, Cytisus nigricans.

K. F., Great Malvern.—1, Iris graminea; 2, Abies nobilis; 3, Cyperus alternifolius variegatus.

L. S., Bristol.—1, Tilia heterophylla; 2, Cratægus Lelandi; 3, insufficient for determination.

S. M. C., Rutland.—The shrub is Piptanthus nepalensis, and the small plant is probably Sedum acre elegans.

C. C. B., Keighley.—1, Polygonum cuspidatum; 2, Primula marginata; 3, P. farinosa; 4, Schizanthus retusus.

P. B., Salisbury.—1, Thalictrum aquilegifolium; 2, T. a. atropurpureum; 3, Pavia macrostachya; 4, Aristolochia Sipho; 5, Clematis montana.

R. H. C., Chelsfield.—1, Cytisus monspessulanus; 2, Viburnum Opulus; 3, Abutilon megapotamicum; 4, Circis siliquastrum; 5, Cuphea Roezli; 6, Strelitzia Regina.

The Jubilee Celebration of the Grand Yorkshire Gala, which takes place on June 17 to 19, promises to be an event of exceptional interest to horticulturists. Many of our readers will no doubt take advantage of the opportunity the Great Northern Railway Company affords them of travelling to the show at a trifling cost. Cheap excursions are arranged from a large number of stations throughout the surrounding country, particulars of which may be obtained at the booking offices.

Windsor Rose Show.

MONDAY, June 29.—Isle of Wight Rose Show at Ryde.

TUESDAY, June 30.—Canterbury Rose Show.
Southampton Horticultural Society's Rose Show; two days.

CATALOGUES RECEIVED.

H. B. MAY AND SONS, DYSON'S LANE, EDMONTON.—A very fine and comprehensive catalogue of exotic and British ferns. There are cultural hints and the average height of the species or variety is given. There are over a hundred and fifty illustrations. A charge of 2s. is made.

HUGH LOW AND CO., BUSH HILL PARK, ENFIELD.—The new list of perpetual-flowering carnations includes illustrations of the capacity of plants at various ages, as well as descriptions of new varieties, and a coloured plate.

JOHN PINCHES, CROWN BUILDINGS, CROWN STREET, CAMBERWELL.—A useful list of goods that appeal to the flower exhibitor. It deals with cups and tubes, exhibition boxes, bloom protectors, etc.

G. COOLING AND SONS, BATH.—A handy, descriptive catalogue of pot roses, climbing plants, carnations and cactus dahlias.

WM. ARTINDALE AND SON, SHEFFIELD.—This catalogue of carnations, chrysanthemums, dahlias, and violas will appeal to many as the alternate pages are ruled for garden notes.

FRANTZ DE LAET, CONTICH, near ANTWERP, BELGIUM.—This is the best catalogue of cacti and succulents we have seen. It is well got up, splendidly illustrated, and the descriptions are in French, German, and English. One shilling per copy is charged.

SKINNER, BOARD, AND CO., BEDMINSTER, BRISTOL.—An abridged catalogue of "wire tension," greenhouses, and heating apparatus, with illustrations of houses recently erected.

ALEX. DICKSON AND SONS, LTD., NEWTOWNARDS, CO. DOWN.—An especially interesting list of new pedigree seedling roses raised by this firm and offered by them for the first time. One H.T., Mrs. David Jardine, has been tested in America and received the highest possible awards.

Morter, 449; Sambucus canadensis Maxima, 451; Chrysanthemum uliginosum, 453; Crocus Malyi, 455; Odontioda Charlesworthi, 456; A Shady Conservatory prettily planted in a Teignmouth Garden, 457; Dendrobium Venus grandiflorum, 459; A corner of Messrs. R. Wallace and Co.'s Garden of choice Tulips, 461.

Mr. A. MITCHELL, Corrour R.S.O., writes us Mar. 5th, 1908:—

"Kindly send on another pair of your splendid Boots. The last pair has worn me over two years, and when I mention my house stands 1,350 feet above Sea level, you can imagine the awful weather, we have nothing but snow and slush the greater part of the year. When I state I never had a wet foot it speaks well for your Boots. Enclosed P.O. 16/-.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Beautiful Garden Trees.

Although an immense advance has within recent years been made both in the appreciation and the utilisation of ornamental trees in the creation of garden scenery, there remains much to be accomplished before they can contribute so liberally as one might wish to the interest and beauty of gardens generally. We have, therefore, thought it well to call attention to them now, and suggest that those of our readers who are specially interested in the arboreal features of their gardens take full advantage of any opportunities they may have for becoming acquainted with the finer forms. There is, speaking in a general way, no period of the year in which tree life can be studied with greater advantage than during the next eight or ten weeks, as when in full leafage their distinctive characteristics can at once be seen, and the effect they produce be readily determined. No longer do trees that properly belong to the park and woodland occupy the greater portion of the space available, but there is still a tendency on the part of some planters to select them rather than those kinds which are variously known as pictorial and garden trees. The great variety of bold, graceful, and other forms available; the remarkable diversity in the colours of flowers and foliage; the varying aspects of those that present us now with tender green leafage, now with beautiful displays of flowers, and anon with the rich hues that precede the fall of the leaf, afford a succession of charming effects, where, in the creation of the scenery of the garden, a proper distinction in the selection of the trees has been made between the park and the garden, or it may be between the woodland and the pleasure grounds. We have not a word to say in depreciation of the stately oak, the wide-spreading beech, or the densely-growing elm. On the contrary, we have so full an appreciation of these noble trees as not to tire of them at any season of the year. We do not suggest they should be banished from gardens, or that they are not desirable in gardens that afford sufficient space for the creation of bold effects; but we do submit that they are not the trees which should be first thought of when the all-important question arises as to the selection of trees for a garden that is being newly made or undergoing improvement. For the creation of garden scenery pictorial trees abound, and advantage should be taken of the wealth of material at command. There are trees of large growth, of moderate stature, and of small size. We have erect-growing trees and weeping trees; we have trees with bronze and crimson leafage that in a well-devised scheme produce a deep tone of colour, and variegated trees that light up the scene with their silvery and golden hues. There is indeed no dearth of trees of the most distinct and beautiful description, or of trees that by reason of the striking contrasts produced are of the highest value for the production of pictorial effects. It is for the purpose of increasing the interest of our readers in garden trees, and of assisting them to become acquainted with their peculiarities of habit, and of leafage and flowers, that we advise their being studied when the study can be made under the most pleasant conditions, and to the greatest advantage. We shall not fail to refer to this question during the planting season, and those who have acted upon our suggestion as far as their opportunities will allow, will be in a better position to take advantage of the advice given them. Those who turn their attention to the subject will naturally have a tendency to pay special attention to those kinds for which they have a preference, but it would be well were those interested to take a broad view in the study of garden trees, and make themselves acquainted with as many kinds as possible. If this be done a much wider selection will be made by the general body of planters, and an adequate representation of tree life be obtained in gardens. We need not particularise here, but it may be useful to suggest that special attention should be given to weeping trees, to trees with finely cut leaves, and to trees with variegated foliage, for there are forms in each of these groups that are not as yet so well represented as they should be. In the case of the third of these groups it is essential to remember that, while they are of much value for lighting up the garden with their bright colours, they must not be too freely used, and their study during the summer is therefore especially desirable. Especially would we commend to the notice of all concerned the Japanese maples, of which there is a multiplicity of forms, because of their

MR. H. E. GRIBBLE.

elegance of habit and leafage, and their extreme usefulness for gardens of comparatively limited dimensions, as under the conditions most favourable to growth they do not soon extend beyond their allotted space.

Mr. H. E. Gribble, whose portrait we have much pleasure in giving in this issue, has for nearly twenty-four years had charge of the magnificent gardens of Wynyard Park, the Durham seat of the Marquis and Marchioness of Londonderry, and during that period has fully justified the high position he occupies among the foremost practical horticulturists at the present time, as indeed for many years past. Of Mr. Gribble's work at Wynyard Park there is no occasion to write at length, for in the Gardeners' Magazine of January 5, 1907, we gave a fully-illustrated account of the gardens there, and from this it will be gathered that in giving practical expression to the views of his noble employers on questions relating to their improvement he has shown remarkable taste and judgment. An eminently successful cultivator of fruits and vegetables, Mr. Gribble has devoted close attention to the ornamental aspects of gardening, and, possessing great natural taste, he has achieved a high degree of success in the maintenance of the older features of these famous gardens and the creation of new ones. Withal Mr. Gribble is the most modest of men, and in proof thereof we would mention that in a walk through the gardens one would fail to hear him taking to himself credit for any of the improvements that have been effected during the period in which he has been in charge. One of the great features of the Wynyard Park Gardens is the geometric flower garden, in which colour schemes of great beauty are annually carried out, but there are others hardly less noteworthy, especially the large area devoted to natural or wild gardening, the rose garden, and the garden of hardy flowers, which have been formed within quite recent years.

Famous Scottish Gardens.—In the issues of the Gardeners' Magazine for June 27 and July 4 we shall give a fully illustrated account of some of the more noteworthy gardens in the vicinity of Perth. The gardens that will be dealt with include those of Dupplin Castle, Freelands, Moncreiffe House, Dunkeld House, Kinfauns Castle, Seggieden, Pitfour Castle, Meikleour House, Ballathie, and Murthly Castle.

Fruits of Foreign Growth were imported in large quantities in May, as indicated by the fact that their value was £777,831, or an increase of £18,824 on the corresponding month of last year. In the imports of apples there was again a large increase, the total having been 193,889 cwt., of the value of £177,593, these figures representing an increase in quantity of 74,746 cwt., and in value of £43,200. Of apricots and peaches 1 cwt. only was received, and this was returned as of the value of £8. In the corresponding month of last year 17 cwt. were imported. There were big increases in the imports of bananas and cherries, and of the last-named fruits the total was 5,826 cwt., of the value of £15,193. Gooseberries, on the other hand, were imported in smaller quantities, the total having been 457 cwt., of the value of £875. Of grapes the imports amounted to 1,168 cwt., of the value of £5,089, these figures representing a decrease as compared with the corresponding month of last year, and a large increase upon the grape imports in May, 1906. Pear imports dropped from 2,896 cwt., of the value of £9,625 in May, 1907, to 2,898 cwt., of the value of £3,669 last month. No plums were imported, but the imports of strawberries amounted to 3,632 cwt., of the value of £8,650.

Strawberries are now being sent to the Metropolitan and other markets in immense quantities from the Hampshire strawberry fields, and both the shops and the costers' barrows are well supplied with the brightly-coloured fruit. In the streets excellent fruit is selling at fourpence per pound, and in the shops the prices range from sixpence per pound upwards. The first of the special trains dispatched from Botley with strawberries brought to London about 15,000 cross-handled baskets, containing between four and five pounds of fruit each.

The Neill Prize which, under the will of the late Dr. Patrick Neill, is awarded every second year by the Royal Caledonian Horticultural Society to a distinguished Scotch botanist or horticulturist, has this year been awarded to John H. Wilson, D.Sc., F.R.S.E., lecturer in Agriculture and Rural Economy, St. Andrew's University. Dr. Wilson has rendered such splendid service in the cause of horticulture and agriculture, more especially in connection with the hybridisation of plants, that we congratulate the Council of the Royal Caledonian Horticultural Society on the award, and Dr. Wilson on the well-deserved honour that has been done him.

The Gardeners' Royal Benevolent Institution.—We are asked to again remind our readers of the 69th anniversary festival dinner in aid of the funds of the Gardeners' Royal Benevolent Institution, which will take place on Wednesday next, the 24th inst., at the Hotel Metropole, under the presidency of Lord Aldenham, who will be supported by an influential and distinguished company on that occasion. Donations to be placed on the chairman's list are earnestly solicited, and may be sent direct to Lord Aldenham, to Harry J. Veitch, Esq., the treasurer, Chelsea, S.W., or to the secretary, Mr. G. J. Ingram, at the offices, 175, Victoria Street, Westminster.

Souvenir of the Grand Yorkshire Gala.—One of the ways in which the Council of the Grand Yorkshire Gala is commemorating its fiftieth annual meeting is by the issue of a very interesting souvenir, consisting of a hundred and thirty-two pages of illustrations, text, and advertisements. The history of the Gala is the most interesting part of the souvenir, and it commences with the inauguration of the Gala in 1858, and the first exhibition in 1859, and tells of the successes and the vicissitudes of the undertaking down to the year 1907. With but three exceptions, the president of the fête has been the Lord Mayor of York for the year. We gather that the fête has always been held in the Bootham Fields. Some of the earlier meetings were not a success, consequently a reserve fund was raised, and this reached £1,000 in 1870. The year 1897 was a most disastrous one for the fête, and we well remember watching the furious gale that swept over York, tearing the tents to pieces, snapping the poles like tinder, and strewing the ground with the choicest plants and flowers that had been gathered together; the financial loss that year was £500. The services of Sir J. Terry and Sir Christopher Milward are acknowledged, and we read how, when Mr. Simmons, who was secretary for [illegible] years, retired in 1902, he was made a [illegible] member, and the present secretary, Mr. [illegible] Arey, was appointed to the office. No fewer than 1,844,817 persons have paid to see the York Gala, and the record attendance was 57,383 in 1899. As prizes for flowers and plants the Gala has expended £26,000, and this year it has a schedule valued at 1,000 guineas. One fine feature of the work of the Council is found in the list of contributions to the York charities, the amount totalling to £2,682 5s., including £62 10s. to the Gardeners' Orphan Fund. We should add that the souvenir is freely illustrated with views of various Gala meetings, of York, and of Messrs. J. Backhouse and Son's nurseries at York.

R.H.S. Gardens Guild.—The [illegible] annual general meeting of the Guild will be held on Wednesday, July 8, the second day of the Holland House Show, at 7 p.m., in the Charles Dickens Room, Carr's Restaurant, Strand. It is particularly hoped that all who have at any time been students or employees in the R.H.S. Gardens at Chiswick or Wisley will endeavour to be present, and will give early notice of their intention to the acting hon. secretary, Mr. R. Wallis, R.H.S. Gardens, Wisley, Ripley, Surrey.

Gardeners' Wages at Kew.—When the vote of £83,124 for salaries and expenses of the Board of Agriculture was before the House of Commons the other day, Mr. Summerbell moved the reduction of the vote by £100 in order to call attention to the wages paid to the gardeners in the Royal Gardens, Kew. He urged that the wages paid to the gardeners should be raised from one guinea to 24s. weekly. It was, in his opinion, begging the question to say that the gardeners were improvers. Dr. Rutherford thought the wages should be raised to the level of those paid in the London parks. In reply, Sir E. Strachey said the gardeners at Kew were young unmarried men, who came under special conditions with a view to obtain experience, and that they could only remain two years. The guinea paid them weekly was more in the nature of a subsistence than a wage, and the advantages they received through being at Kew for the two years had to be taken into account.

Vegetable Imports in May comprised 1,262,032 cwt. of potatoes, of which 257,853 cwt. came from Germany, 222,415 cwt. from France, 159,211 cwt. from the Channel Islands, and 622,533 cwt. from other countries; 883,819 bushels of onions, and 88,901 cwt. of tomatoes.

A Link with the Past.—We are reminded by the death of Mr. Barclay Phillips, at Bedford, on May 9, that his family had a long connection with horticulture. In his earlier years Mr. Barclay Phillips was a reporter in the old House of Commons, and as he died at the advanced age of 94 years, he must have remembered his father's horticultural and botanical tendencies. Mr. Henry Phillips, the father of Mr. B. Phillips, is best known to modern horticulturists through his two-volume works, "Flora Historica," "Sylva Florifera," and "History of Cultivated Vegetables." He was also the author of "Pomarium Britanicum," and other works. At Brighton he designed a large glass house, named the Athenæum; this had a ridge and furrow roof and from it Sir Joseph Paxton took the idea that subsequently materialised in the Chatsworth conservatory, the Great Exhibition, and the Crystal Palace. Mr. H. Phillips died in 1831.

YORK JUBILEE FÊTE AND GALA.

◆

For the fiftieth successive year the grand Yorkshire Gale was held, on June 17, 18, and 19, in the Bootham Fields, York. Special efforts were made to make this jubilee celebration a great success, and a sum of one thousand guineas was set apart for prizes for plants, flowers, fruits, and vegetables, and the schedule was reorganised. In the matter of extent, the show was not so very much larger than on previous occasions; at least, so it seemed to us, but in matters of quality and novelty the exhibition stood out as an unqualified success; indeed, we can hardly remember so large a provincial show where such high quality prevailed in every department.

All the arrangements were excellent, and the tents were lighted with electric light at night. All the officers of the Gala Committee are to be heartily congratulated upon the horticultural success of the jubilee show, but once again they had failed to settle with the Clerk of the Weather. The eve of the show was dull, but early on the first morning rain began to fall, and continued steadily until about one o'clock, and consequently the approaches to the tents soon became quagmires. The committee, however, procured railway sleepers and made a solid road from the chief entrance up to the tents, and cartloads of straw were soon brought to make a dry pathway at each tent entrance. As we write we can but hope that better weather prevailed during the second and third day, so that the financial success may be as great as the horticultural one. The show was held in what were practically four huge and broad tents, arranged gridiron fashion, so that once inside there was no need for a visitor to go out again until he or she had inspected the whole of the exhibits.

The special jubilee classes, four in number, were not entered into with the keenness we had anticipated, and in two of them but one exhibitor entered. The rockwork and alpine class was the great success of the show, and in this Messrs. J. Backhouse and Son, Lim., York, not only won first place, but also the jubilee medal for the best exhibit in the show, and one of the special gold medals offered this season. The Royal Horticultural Society sent down a deputation, consisting of Sir Trevor Lawrence, Bart., Sir Albert Rollit, Rev. W. Wilks, Mr. J. Gurney Fowler, Mr. H. B. May, and Mr. Harry J. Veitch. These gentlemen made numerous awards, as our award list shows, and these gave great pleasure to the exhibitors.

JUBILEE CLASSES.

The leading jubilee commemoration class was one for the most meritorious and imposing festal display of plants and flowers arranged on a space of 30ft. by 14ft., one frontage, all kinds of flowers and plants admitted. There were three competitors, and the premier award of £40 was awarded to Mr. W. A. Holmes, West End Nurseries, Chesterfield, for a very beautiful exhibit, in which tall, brilliant single-stemmed crotons were a leading feature. The background was of fine kentias, silver acers, and handsome crotons, and in front of these the various well-grown plants were arranged with great care and taste, smaller plants, chiefly bright-foliaged ones, filling in the groundwork. Pillar roses were effectively and gracefully used, and a big sheaf of white and pink liliums made a lovely centrepiece, while tall arrangements of cut carnations occupied positions near the front corners, and a few orchid spikes rose from small mounds of asparagus and crotons. Second prize fell to our coadjutor, Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Bardon Hill, Westwood, Leeds, who had an excellent display that needed a little brightening towards the back centre. His crotons were very fine, and the groundwork of miltonias towards the front was very effective; while the tall arched rods of Vitis Henryana, each with a basket of odontoglossum spikes suspended from it, made a novel feature. Mr. W. Vause, Leamington, was placed third, and he, too, had a good group, but it needed taller light plants to lend it the grace seen in the other displays.

Messrs. Walshaw and Son, Scarborough, were awarded a fourth prize for a small exhibit of irises, liliums, lilac, arums, spiræas, ranunculuses, etc., in the class that was intended to show the advancement of the horticulturists' skill in recent methods of retarding plants and flowers, but the season was hardly suitable for such an object.

In the county class for garden produce Mr. J. C. McPherson, gardener to Lord Londesborough, Londesborough, Market Weighton, was granted the second award for a moderate exhibit, in which schizanthuses and sweet peas figured as flowers. There were fair peaches, nectarines, melons, figs, grapes, and cherries, and a fair collection of vegetables.

In the other jubilee class for the most meritorious combination display of horticultural products, there were three competitors, and the premier prize fell to Mr. Charles E. Simpson, 24, Spurriergate, York (gardener, Mr. F. Nutbrown). The chief features of the exhibit were various floral designs, notably a font of white and purple pinks, with a fountain in the centre; a cushion in mauve pinks, with odontoglossums; a Prince of Wales' feathers; a chaplet in white and crimson pyrethrums; and a huge circular wreath in white stocks and pink carnations. Bouquets of dark roses and of odontoglossums were also interspersed, while the front portion of the table was filled with high-class melons, lemons, peaches, bananas, pineapples, strawberries, and apples. The whole scheme was tasteful, good, and well carried out. Messrs. W. Artindale and Son, of Sheffield, were second, with a huge harp in lavender sweet peas, liliums, and orchids; "gates ajar," done in white stocks, with a frame of pink roses; also a bay-leaf wreath, vases and baskets of flowers, but no fruit. Messrs. J. Backhouse and Son, Lim., were third, having a lady's hat and muff in flowers, and other handsome designs, specially a harp in white roses, with the corners in crimson roses; another big wreath in lilies of the valley, with pink roses at the top, was fine. They also had some dishes of good fresh fruits.

ORCHIDS.

A beautiful set of twelve orchids, arranged by Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, C.I.E., Westonbirt, Tetbury, Gloucester, was one of the great attractions of the show. It worthily won the first prize in its class—i.e., the Veitch Memorial Gold Medal; the plants shown were Miltonia vexillaria chelsiensis, with thirteen spikes and fifty-three flowers; Miltonia vexillaria Augusta Victoria, with thirty-one flowers; Cypripedium callosum Sanderæ, with seven flowers; Cattleya gigas, C. fulvescens, C. Whitei splendidissimum, C. Mossiæ Wagneri Westonbirt var., C. Dusseldorfi, Lælio-cattleya Canhamiana, Dendrobium Dalhou-nobile, L.-c. Martinetti Flambeau, and Odontoglossum crispum Erebus.

The dozen orchids so well shown by Lieut.-Colonel Holford formed the centrepiece of a magnificent group of these aristocratic flowers, put up in a most tasteful manner by Mr. H. Alexander, who, we regret to learn, slipped on a box during the eve of the show and badly bruised and hurt himself by the fall; he was, fortunately, able to come to the show the next morning. Venda teres, Brasso-cattleya Digbyano-Mossiæ, Lælio-cattleya Canhamiana, Miltonia vexillaria in variety, including the beautiful Cattleya Dusseldorfi var. Undine, Odontoglossum crispum in variety, and a fine O. citrosmum, with two hundred flowers, were included. There were in this beautiful and bright display no fewer than a hundred spikes of O. crispum, two hundred and fifty flowers of Lælia-cattleya Canhamiana—all of Westonbirt raising; a hundred and thirty Miltonia vexillaria spikes, etc.

First prize for six orchids was won by Messrs. James Cypher and Sons, Cheltenham, who scored with Cattleya Mossiæ, Lælio-cattleya Aphrodite, Epidendrum prismatocarpum, L.-c. Canhamiana, L. purpurata, and Odontoglossum crispum; this firm also led for three orchids, showing a fine Odontoglossum percultum in this set. For ten orchids Messrs. J. Cypher and Sons were again first, and their best plants in this set were Vanda teres gigantea, Oncidium macranthum, L.-c. Canhamiana magnifica, and Cattleya Dusseldorfi.

In the class for a group of orchids, 15ft. by 5ft., arranged for effect, Messrs. J. Cypher and Sons, Cheltenham, were again to the front, winning first prize with a graceful, beautiful, and bright display. The background consisted of tall oncidiums and odontoglossums, with arches of cut blooms above them and a few palms behind. Asparagus sprays were freely used, and ferns were used as a groundwork for the miltonias, cattleyas, lælio-cattleyas, etc., that formed the body of the group. In this class Messrs. J. W. Moore, Lim., Rawdon, Leeds, secured second place with a very bold and effective exhibit that must have run Messrs. Cypher and Sons, closely. Here the background was of three bold erections of virgin cork, asparagus, and orchids, the drooping spikes of odontoglossums looking well under these conditions. Lælio-cattleyas were a great feature of this group, and Cypripedium bellatulum figured well also. Third prize fell to Mr. J. Robson, Altrincham.

Mr. Robson was second for three orchids; Mr. W. P. Burkinshaw, West Hill, Hessle, second for six, and also for ten orchids, and also for six orchids, and he won the Veitch Memorial Bronze Medal for a dozen orchids. Mr. Burkinshaw led for three orchids, and Mr. F. J. Montagu, Melton Park, Doncaster (gardener, Mr. E. Hill), was placed second for six orchids, and second for three orchids in the amateurs' section.

GROUPS.

The large group class is usually a popular one at York, and each display has to occupy 300 square feet, but on this occasion, though there were five competitors, the strongest exhibtors had succumbed to the greater attractions of the Jubilee Festal display class, and consequently the group class lacked something in quality. The first prize was awarded to Mr. Skinner, gardener to J. W. Coulthurst, Esq., Gargrave House, Leeds; Humea elegans, crotons, a pair of big roses—Hiawatha and Dorothy Perkins—were the leading features, but the foreground of dark moss, with its pool of dirty water, in which were rotting moss-covered tree branches, did not appeal to us at all; it was carrying realism too far. Second place was accorded to Mr. J. Sharp, Valley Nurseries, Almondbury, Huddersfield, for an arrangement that had nothing striking about it, either in design or colour effect, the pillar roses being the best part of the display. Mr. W. Curtis, gardener to J. Blacker, Esq., Thorpe Villas, Selby, gained third place for a display in which white flowers—liliums and odontoglossums—were good, but too freely used. Messrs. R. Simpson and Son, Brook Street, Selby, fourth.

FRUIT AND VEGETABLES.

Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, was awarded first prize for a decorated dessert table, winning with a fine and handsome display that gained 89 out of a possible 108 points, and showed good white and black grapes, splendid Negro Largo figs, Grosse Mignonne peaches, Cardinal nectarines, Royal Jubilee melons, and Kentish Favourite strawberries. Oncidium spikes were used for decorating the table. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, came second with 88 points, showing good fruit as usual, and a decoration of francoa and Schizanthus retusus; third prize fell to Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, who had 82 points, and Mr. T. Patteson, gardener to W. C. Gray, Esq., Tunstall Manor, West Hartlepool, was fourth with 73 points; there were seven competitors.

The best collection of ten kinds of fruits was the one from Mr. J. C. McPherson, gardener to Lord Londesborough, Market Weighton; he had finely-berried Muscat and Black Hamburgh grapes, Royal Sovereign strawberries, Lord Napier nectarines, Early Rivers cherries, oranges, Brown Turkey figs, Ringleader melons, and Royal George peaches; Mr. J. H. Goodacre came second, and Messrs. Colebrook Brothers, Burton-on-Trent, were third. Mr. McPherson was also to the fore in the class for six kinds of fruits, winning with grapes, melons, nectarines, and a splendid dish of Leader strawberries; Mr. W. Nicholls, gardener to the Right Hon. Lady Beaumont, Carlton Towers, Yorks, second; and Messrs. Colebrook Brothers third.

Mr. C. Lawton, gardener to Colonel Harrison Broadley, M.P., Welton House, East Yorks, led for peaches with Grosse Mignonne, and Mr. Goodacre led for nectarines with Early Rivers, finely coloured. For Black Hamburgh grapes, Mr. J. Bray, gardener to Lady Hawke, Wighill Park, Tadcaster, led with good clusters, and Mr. W. Nichols led for white grapes with Buckland Sweetwater in fine condition. Mr. Searle had the best dish of figs, and Mr. Brotherson, gardener to F. Samuelson, Esq., Breckenbrough Hall, Thirsk, had the best dish of strawberries—a grand dish of Royal Sovereign.

First prize in Messrs. Webb and Sons' class for six kinds of vegetables was well won by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, with grand dishes of Stourbridge Marrow peas, Wordsley Pride potatoes, Moore's Cream marrows, Sensation tomatoes, Early Mammoth cauliflowers, and Prizewinner carrots; Mr. A. R. Searle, Castle Ashby Gardens, second; and Mr. B. Ashton, gardener to the Earl of Lathom, Lathom House, Ormskirk, third.

ROSES.

These made a most imposing display, and the competition in the cut flower classes was very much better than we had expected. In the premier class for seventy-two blooms, in not less than three dozen varieties, Messrs. D. Prior and Sons, Colchester, led the way with a bright set of clean blooms that included good specimens of Liberty, Comtesse de Nadaillac, Marechal Niel, Frau Karl Druschki, General Jacqueminot, Marie Verdier, Madame Jules Gravereaux, Mrs. J. Laing, and Queen of Spain. Mr. George Mount, Canterbury, was a good second in this class, and he had grand flowers of Ulrich Brunner, Frau Karl Druschki, and Mrs. J. Laing, but his boxes lacked yellow colouring; Messrs. B. R. Cant and Sons, Colchester, were placed third, and Messrs. Harkness and Sons, Hitchin, fourth.

There were four entrants in the class for forty-eight roses, not fewer than twenty-four varieties, and here Mr. George Mount was the victor, leading with a well-balanced set, in which Richmond, Captain Hayward, Golden Gate, and Frau Karl Druschki were finely represented. Messrs. D. Prior and Sons, Colchester, came second, Messrs. B. R. Cant and Sons third, and Messrs. Harkness and Sons fourth.

Five competitors entered in the class for thirty-six roses in not fewer than eighteen varieties, and here the awards in order of merit were made in favour of Messrs. Harkness and Sons—whose blooms were good but a trifle overdressed; Mr. George Mount, Messrs. D. Prior and Sons, and Messrs. B. R. Cant and Sons.

There were five entries of twenty-four distinct roses, and Mr. E. J. Hicks, The Rose Gardens, Twyford, Berks, led easily in this competition, and was followed in order by Messrs. D. Prior and Sons, and Mr. George Mount. Mr. W. Hutchinson, Kirbymoorside, led for eighteen roses in the amateur class; while in the trade class for a similar number of blooms Mr. E. J. Hicks, Twyford, was a fine first, the judges quite passing over a box of good flowers that had been spoiled by overdressing; Mr. George Mount second, and Messrs. B. R. Cant and Sons third. In the class for a dozen white or yellow roses Mr. George Prince, Longworth, Berks, worthily won first place with very bold examples of Marechal Niel, Comtesse de Nadaillac, Medea, and Souv. de S. A. Prince. Messrs. D. Prior and Sons, Colchester, came second, and Mr. E. J. Hicks third.

For a group of twenty pots of roses, Mr. W. Longstaff scored with a pretty arangement of rambling and bush roses, the Frau Karl Druschkis being notably good; Mr. J. E. Skaife was second, and Mr. H. Pybus was third. For a group of roses in pots, arranged for effect, Mr. Skaife secured premier place with a really good display, and Mr. W. Todd, Vyner Street, Haxby Road, York, was second. There was a keen competition in the class for a collection of pot and cut roses, arranged for effect, and Mr. George Prince, Longworth, scored with a beautiful display, in which lovely bunches of garden roses and exquisite and fragrant tea and hybrid tea roses were charmingly disposed. Messrs. W. and J. Brown, Stamford, came second, and Mr. G. Mount, with some very fine flowers, was third.

ROCK AND ALPINE GARDENS.

The class for a group of hardy herbaceous and alpine plants and flowers was an unqualified success, and it resolved itself into a rockwork and alpine garden competition, and a fine competition at that. The premier award, and also the Jubilee Gold Medal for the best exhibit in the show, was awarded to Messrs. J. Backhouse and Son, Lim., The Nurseries, York, to whom we tender our heartiest congratulations.

It is difficult to describe the exhibit, but we may say that there was an irregular background of rockwork, with a tiny alpine path running along its base, and skirting a stream and little pools of water, the latter having a foreground of irregular rock masses. Eremurus and roses provided the floral background, and the rockwork was topped with rhododendrons and small conifers, while, lower down, were patches of dianthuses, saxifrages, incarvilleas, and hardy orchids. In the end recess a miniature waterfall lent life to the display, and the rocks on either side provided a home for a few beautiful hardy ferns. In the water were water lilies and arums, and in the boggy sides of the pool were colonies of spiræas, hardy cypripediums, Primula sikkimensis, etc. In the front, again, were dianthuses, sedums, tiny conifers, Saracenia purpurea, etc. The whole was beautifully arranged, and showed evidence of unusual skill and patience.

Messrs. W. Artindale and Son, Sheffield, gained the second place, and they also had a very fine exhibit, boldly planted and designed. Spiræas, Primula japonica, and P. Sikkimensis, incarvilleas, rhododendrons, eremuri, and saxifrages in variety were the leading features of a very bright and attractive exhibit. Mr. J. Wood, Boston Spa, Yorks, had a very interesting rockwork exhibit that was charmingly designed and carefully planted, but it needed a little more finish over the bolder central rocks, and also a prettier background. Mr. J. Cottam, Alma Gardens, Cottingham, fourth.

SPECIMEN PLANTS.

Messrs. J. Cypher and Sons, Cheltenham, secured the leading place for six stove and greenhouse plants, with giant examples of Ixora Williamsi, Statice intermedia, Franciscea eximia, Erica Cavendishiana, and Bougainvillea Cypheri, the latter particularly fine. The best nine stove or greenhouse plants were those contributed by the famous Cheltenham firm of Messrs. J. Cypher and Sons, who had splendid examples of Erica ventricosa magnifica, Franciscea eximia, Ixora Pilgrimi, I. Fraseri, Clerodendron Balfouri, Anthurium Scherzerianum, Bougainvillea Sanderiana, Pimelia diosmæfolia, and a huge Erica Cavendishiana, all splendidly flowered.

Messrs. Cypher and Sons had the best single greenhouse plant—a good Erica ventricosa magnifica—but they were second for a stove plant with Ixora Pilgrimi. The first prize for three crotons, huge, brilliant bushes, fell to Messrs. Cypher and Sons, and this firm came second for one croton with C. angustifolium, no first prize being awarded. Mr. W. J. E. Sharpe led for a fine foliage plant with a very good Cycas revoluta; Mr. W. Vause, Leamington, was second for three crotons, but was first for three stove and greenhouse plants, the latter including good specimens of Erica Cavendishiana and E. ventricosa. Mr. Vause was second for six stove and greenhouse plants, his set including a good Anthurium Scherzerianum; he was also second for nine stove and greenhouse plants, first for three fine foliage plants, and first for a single specimen stove plant.

HARDY FLOWERS.

There were four fine exhibits of hardy flowers in the principal class for these, and here Messrs. G. Gibson and Sons, Leeming Bar, Bedale, were placed first for a grand lot of blooms in fine bunches, but all too flatly arranged; the colours of the poppies, pyrethrums, irises, lupins, heucheras, and kniphofias, were gorgeous, and the flowers were well grown. Messrs. Harkness and Sons, Bedale, came second, and here the spikes of eremurus relieved the general flatness. Messrs. W. Artindale and Son, Sheffield, had the most imposing exhibit, their tall vases of poppies, gladioli, liliums, spiræas, and lupins standing up boldly from the lower bunches; Mr. G. Cottam, Alma Gardens, Cottingham, fourth.

Messrs. G. Gibson and Co., Leeming Bar, scored for twenty-four bunches of hardy border flowers, and here their anemone-flowered pink pyrethrum Madame Munier was very beautiful; Messrs. Harkness and Sons, second; Mr. W. Hutchinson, third; and Mr. G. Cottam fourth.

MEDALS AND CUPS.

Gold Medals.—Mr. J. Coulthurst, for group of plants; Messrs. William Cutbush and Son, Highgate; Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester; Messrs. J. Backhouse and Son, Lim., York; and Messrs. J. Veitch and Sons, Chelsea.

York Jubilee Medal.—Messrs. J. Backhouse and Son Lim., York, for their alpine exhibit.

Silver Cups.—Mr. Donoghue, gardener to J. Pickersgill, Esq., Leeds; Mr. Joe S. Sharp, Almondbury, Huddersfield; Mr. W. Curtis, gardener to J. Blacker, Esq., Thorpe Villas, Selby; Mr. George Prince, Longworth; Messrs. J. Cypher and Sons, Cheltenham; Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop; Mr. J. Goodacre, gardener to the Earl of Harrington, Elvaston; Messrs. R. Smith and Co., Worcester; Messrs. R. H. Bath, Lim., Wisbech; Messrs. G. Bunyard and Co., Maidstone; Messrs. Hugh Low and Co., Enfield; Messrs. Kelway and Son, Langport, Somerset; Messrs. Ker and Sons, Liverpool; Messrs. Dicksons, Lim., Chester; and Messrs. W. Artindale and Son, Sheffield.

Hogg Medal.—Messrs. Laxton Brothers, Bedford.

Silver-Gilt Knightian.—Messrs. Sutton and Sons, Reading.

Silver-Gilt Flora Medal.—Messrs. J. Peed and Son, West Norwood; Mr. W. Vause, Leamington; Mr. J. Wood, Boston Spa, York; Messrs. W and J. Brown, Peterborough; Mr. G. Mount, Canterbury; Mr. W. P. Burkinshaw, Hessle; Messrs. J. W. Moore, Lim., Rawdon, Leeds; Messrs. G. Gibson and Co., Leeming Bar; Messrs. Harkness and Sons, Bedale.

Silver Flora Medal.—Mr. John Forbes, Hawick; Mr. C. W. Breadmore, Winchester; Mr. W. Kettlewell, Horner Street, York; Mr. W. F. Crowther, Wigginton Terrace, York; Messrs. Kent and Brydon, Darlington.

Silver Banksian.—Messrs. Batchelor and Sons, Harlow Heath, Harrogate; Mr. J. E. Skaife, Burton Lane, York.

Award of Merit.—To Nepenthes excelsa, from Messrs. James Veitch and Sons; and to Marguerite Pink Alexandra, from Messrs. Ker and Sons, Liverpool.

⁂ We regret that extreme pressure upon our space this week compels us to hold over our description of the Non-competitive exhibits at York.

FERN FRONDS.

Although superficially there is a great resemblance between some forms of fern fronds and the foliage of some kinds of flowering plants, especially those which assume pinnate and decomposite characters, there is always existent the fundamental difference that it is the fern frond which bears the fruits, while leaves proper never do so.

The fern fruit, too, differs in character from that of flowering plants, consisting as [illegible] not of fertilised seeds with various [illegible], such as attractive pulp or other [illegible] adapted to assist their dissemination or protection, but of nonfertilised [illegible] spores whose function it is eventually to produce a preliminary growth capable of bearing the equivalents of flowers, and of eventually, by their interaction, reproducing a fern of the parental type. A seed differs furthermore from a spore in being provided with a store of [illegible] capable of assisting the young plant in its start in life, while the spore appears to be nothing more than a single [illegible] cell provided only with a protective husk, which, under congenial conditions of moisture, bursts and permits this cell to [illegible] protrude, and by the immediate formation of feeding rootlets to multiply itself and build up the preliminary growth aforesaid.

The minutiæ of this process, however, we will not here enter into, as it is the frond itself with which we have chosen to deal. A fern frond resembles ordinary leaves in one essential respect, viz., it is composed of a stalk, which becoming a midrib, bears on either side a divided or undivided cellular tissue which fills up, and is supported by a system of minor midribs or veins according to its structure. In the common Hartstongue we have the simplest example of undivided fronds, a stout stalk at the base, and then a midrib or rhachis bearing on either side a flat cellular tissue [illegible] sustained by a succession of veins which, starting singly from the midrib, fork into pairs and continue to the extreme edge of the frond, the only prominent support being the midrib itself.

Turn we now to a divided form, say the common Polypodium vulgare, and we find that the rhachis is flanked for the greater part of its length by a series of separated [illegible] or pinnæ, whose broadened bases touch each other, and each of which has a [illegible] midrib of its own springing from the main one, while the cellular tissue is borne upon a characteristic vein system, which forks repeatedly as a rule, but occasionally stops short at points where these veins are destined to act as feeders to the spore heaps.

These two examples may be taken as typical of all undivided and divided fern fronds, though each species has its own characteristic form of vein system or venation as it has of that in which it bears its spores. In some the venation is simple, as in the Hartstongue, and in others, it may be netted and varied in many ways, but in the normal types it may be relied upon to adhere as to plan, if not in detail, to the specific or generic type. In abnormal forms, or "sports," however, where the form of the frond is greatly altered, the venation is naturally altered too, since in point of fact it is this which determines the outline and general make; it forms as it were the ground plan upon which the cellular tissue is distributed. In the Hartstongue for instance, when it assumes the crispum or frilled forms, in which the outer edge of the frond may be fully twice as long as the midrib, and consequently becomes perforce frilled or folded, we see the normally once forked veins fork and fork again, thus preserving their normal distance from each other instead of spreading out wider and wider apart as they would otherwise inevitably do. The presumption, therefore, is that this "sport" is determined by an abnormal tendency to multiplication of the veins by furcation on otherwise normal lines, just as in the crested or tasselled ferns we find this due to a tendency of the primary, secondary, or even tertiary midribs to multiply themselves by fission on multiform lines, thus producing many terminal growths instead of only one.

In the divided ferns, taking the pinnate Polypodium vulgare again as a type of many, we see in the normal pinna, a smooth or faintly crenate edge where the bulk of the veins terminate evenly. Given, however, very robust growth, we may perceive a tendency to form a serrate or sawtoothed edge due to the veins carrying the tissue with them a little farther, and on this principle, availing ourselves of numerous wild "sports," we can form a series ranging through crenate, serrate, sub-bipinnate, bipinnate, up even to tripinnate, or quite decomposite varieties. This is due to the fact that the more the terminal veins tend to project beyond the normal outline, the greater the tendency they show to deepen the interstices and assume on their own account the characteristic venation of the pinna whence they sprang, so that decompound forms result in extreme cases instead of long, thready projections.

In the Polystichums, and more recently in the Nephrolepis, we have examples of this; in P. lonchitis, the Holly fern, the specific form is pinnate with markedly serrate lobes; in P. aculeatum and P. angulare, it is bipinnate on similar lines, but in the last-named species, as varieties, we have actually quinquepinnate forms, the final divisions, though extremely fine and slender, nevertheless showing the characteristic structure of the normal pinna. In Nephrolepis exaltata, N. e. Piersonii affords a parallel example but of less development, so far being only tripinnate. As a general rule the form of the frond and that of its divisions is correlative, so that with crested ferns, a heavy terminal crest to the frond means smaller but still heavy ones to the pinnæ and obvious ones in the pinnules, the terminal cells being similarly affected throughout, and showing the effect, as it were, to the best of their capacity.

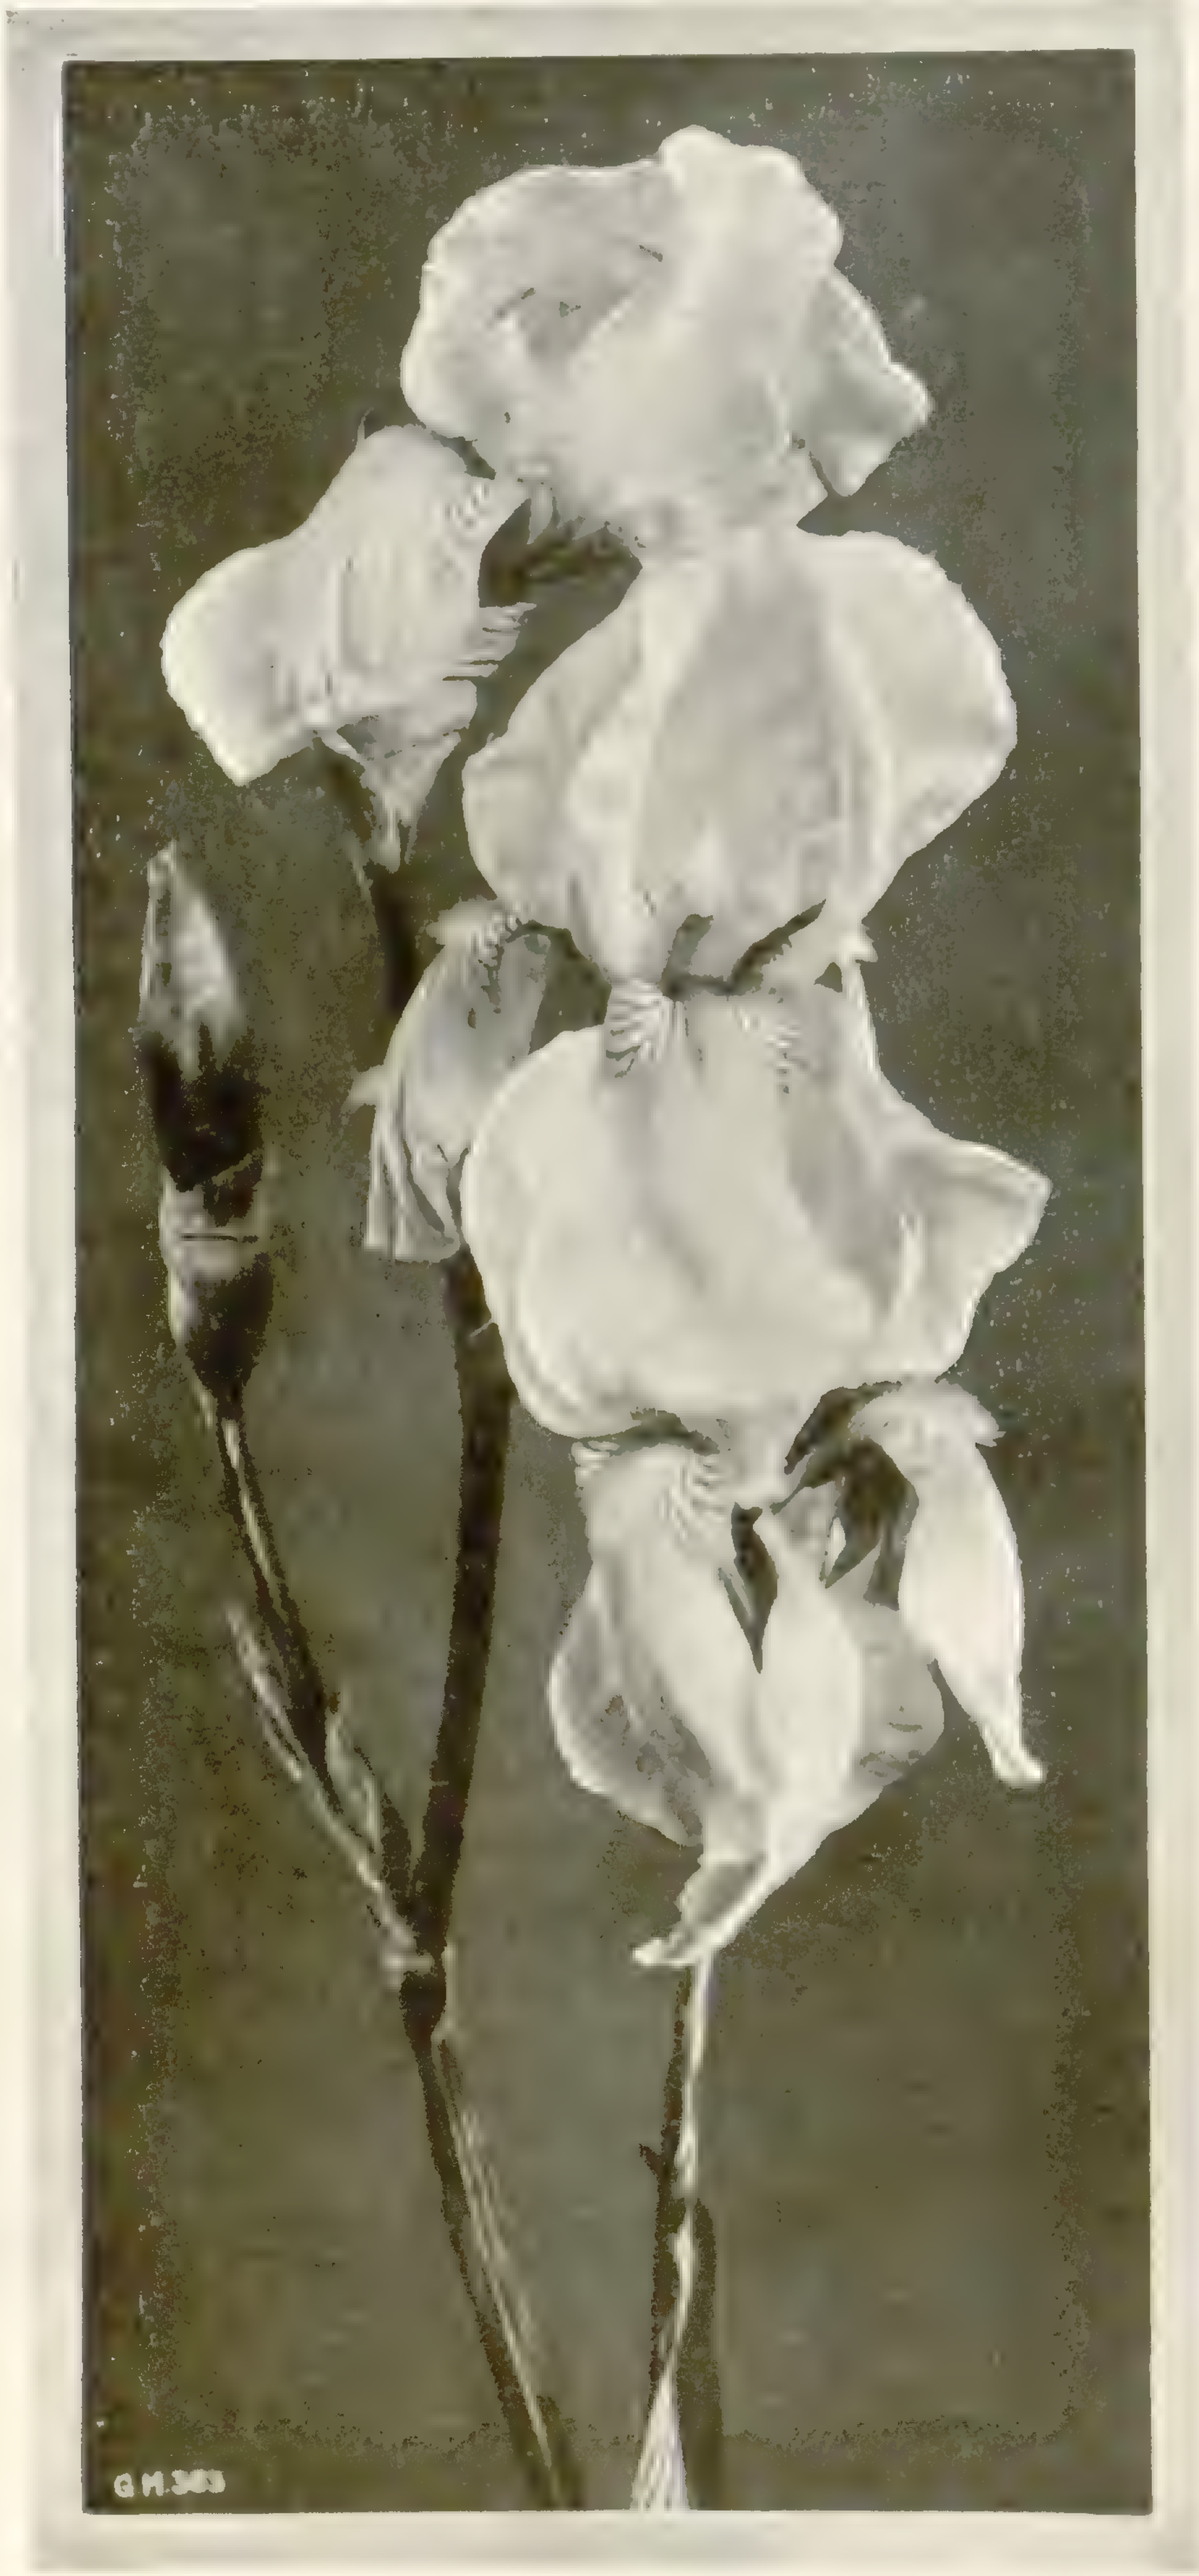
There are exceptions, but they are very few. Some ostensibly terminal cells appear to be incapable of building up the final wall or skin which forms a normal

DEUTZIA WILSONI.

Flowers pure white. A.M., R.H.S., June 9; Messrs. Jas. Veitch and Sons, Chelsea.

frond tip or edge, and this incapacity leads sometimes to very curious and interesting results. Ordinarily, for instance, a tasselled fern shows when its fronds uncoil the complete tassel with all its strands, and this simply enlarges and perfects itself, but in some cases the tassel is only visible as a rudimentary one, a sort of woolly-looking tip, and this subsequently grows and divides and subdivides almost ad infinitum until the frond in due course actually perishes. In Pteris serrulata var Applebyanum, we once had a frond which formed a small tassel all of which died in the winter but one strand, and in the following season this grew as described, producing an immense ball of crestings. In Athyrium Filex-fœmina var. unco-glomeratum, which is practically all crest, although it is a deciduous fern, Dr. Mansfield found that this incapacity of ceasing terminal growth actually prevented terminal decay if the tips were severed and layered when the rest of the frond perished. These resumed growth the following spring by producing rooting bulbils and also aposporous prothalli, so that practically the growth is endless. In some forms of fringed Hartstongues the lateral veins are of this character, and grow out first into long slender threads and then into prothalli which breed another generation of plants. In this respect, therefore, as in others, the frond differs essentially from the leaf.

Chas. T. Druery, V.M.H., F.L.S.



IRIS CARTHUSIANA.

Flowers pale blue, veined deeper blue, and marked with yellow and yellow-brown on the falls. A.M., R.H.S., June 9; Mr. J. W. Marshall, Charterhouse, Godalming.

LAWNS AND PADDOCKS.

The subject of lawns and paddocks often gives the gardener a considerable amount of anxiety.

Lawns.

A lawn once established should not be neglected, because if left to itself it will be necessary probably in a few years to make it anew.

In its management it requires to be weeded in spring and again in the autumn in order to get rid of strong-rooted and large-leaved plants, such as sorrel, plantains, dandelions, and other obnoxious weeds which may have sprung up. The common daisy is sometimes very abundant upon lawns, being a most troublesome weed, and scarcely to be destroyed except by careful attention. Its stems are prostrate and strike root readily, having the property of producing numerous eyes at the surface of the ground, which rapidly grow into branches and root with great facility. The stems being brittle these side branches are readily separated, when they maintain an independent existence, each producing other side shoots which will root and break off in like manner.

This habit of the daisy has given rise to the idea that the plant has a creeping root, but in reality its roots are mere fibres, which strike down perpendicularly into the soil. It is because of the abundance of these rooting side branches which the daisy is continually producing that this plant is so difficult to eradicate, and mere harrowing and spudding fail to obliterate it.

In addition to the branching habit of the daisy, every head of flowers that is allowed to ripen seed sheds some 50 or 60 seed vessels, which germinate in a few days after they touch the damp soil, and form a fresh supply of viviparous plants. Hence the advantage of daisy rakes in keeping lawns in order, but these do not extirpate the original plants, they only prevent further multiplication by seed.

The best plan is to smother the daisy by encouraging grass to flourish; the daisy has a great aversion to being choked up. An occasional manurial dressing of sulphate of ammonia, 4ozs. to the square yard and watered in if the weather is dry, will bring the grasses to the front and choke out the weeds. In the autumn, when the lawn is not in use, a liberal application of soot may advantageously be given, which is an effectual restorer of weakly grasses. Such manures as basic slag, kainit, and superphosphate encourage clovers and weedy plants, so should as a rule be avoided.

If the lawn is infested with moss, a dressing of sulphate of copper, 2ozs. per square yard may be given; or early in spring or late in autumn an application of gas-water may be recommended, using one gallon of gas-liquid to five gallons of clear water; this will kill the moss, and also improve the grasses by giving them a darker green colour.

For exhausted soils a light dressing of guano or finely sifted hen manure largely mixed with sand and leaf-mould may be applied after the grass begins to grow in spring.

A lawn should be mown often enough to prevent the grass or other plants from coming to seed, and the ground rolled after every mowing.

If the lawn is coarse, owing to the turf having been taken from a bad pasture, it may be improved by sowing some good grass seeds, frequent mowing, and by often rolling with a heavy garden roller during moist weather. Should there be any vacant or exposed places they must be filled up by re-sowing seeds, and sprinkling over them a thin covering of mould.

Paddocks.

A paddock is generally the name given to that portion of meadow land which surrounds or is adjacent to a dwelling house, where a few cows, horses, or sheep are kept, according to the taste of the occupier.

When the paddock is grazed all the year round, the land stands less in need of manual assistance than when an annual crop of hay is taken off; but in either case it is a point of good management to keep the land always in good heart; and as there is usually a natural prejudice against the breaking up of such land for permanent improvement, recourse must be had to top-dressing with short dung, basic slag, and possibly a little kainit. A dressing of eight tons of dung per acre once in each five years, then eight cwt. of slag, and two hundredweight of kainit once in each three years will be beneficial.

If any rough patches of unconsumed grasses exist, give to these places a sprinkling of common salt, 6ozs. per square yard, this will sweeten the herbage and the animals will graze it close to the ground.

Spud out docks, thistles, nettles, cow parsley, or other rank growths which may from time to time appear, and spread the animal droppings occasionally. A bush-harrow or chain-harrow drawn over the paddock early in spring often does good service to the finer grasses. Nothing improves a pasture like a very heavy rolling when the ground is moist in January or February.

J. J. Willis.

Harpenden.

CAMPANULA TOMMASINIANA.

The peculiar and subtle charm of many alpine harebells lies in their quaintness. In C. Allioni, for instance, there is a small plant practically obscured by its flower. In C. pumila alba (La Religieuse des près) there is an attitude suggested in its pretty French popular name. In C. excisa and C. Zoysi quaintness of form in the miniature is the attractive feature, whilst in C. Tommasiniana there is a quaint type of beauty almost unique in garden plants. Happily it is a long-lived perennial that delights in gritty soils, not necessarily dry or sun-baked: it will thrive just as well, or better, in the plant border as on the rockery.

The plant is tufted, and may be described as resembling a strong bedding lobelia in habit and size, but some specimens I have seen averaged a foot in diameter. Flowers are produced in abundance from established tufts in June and July, and a few are in evidence till winter sets in. They are very quaintly formed, being cylindrical, with minutely-cleft corolla lobes that do not reflex fully, and their beautiful colouring, a pale but attractive blue, is a rare beauty that would baffle a clever artist to accurately reproduce.

Its home is the rock garden, because here it is possible to raise the plant to the eye level, and the full beauty of the comfit-shaped flowers, nestling in their thicket of green leafy trails is not lost. It thrives best in those parts where the soil overlies limestone, but cultivation is merely a question of keeping slugs at bay.

G. B. Mallett.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

LILIUM MONADELPHUM.

This is an old but very distinct and most beautiful lily, to which, beside that at the head of this note has been given the specific names of L. colchicum, and L. szovitzianum. This last, however, is now generally recognised as a distinct variety of L. monadelphum. It flowers as a rule in May or during the early part of June, and is, therefore, entitled to rank among the early-flowering lilies. In the variety L. szovitzianum the flowers are larger and the anthers chocolate instead of the yellowish-tinted ones of the type. A marked point of difference is that the stamens of L. monadelphum are united towards the lower part, whereas in the variety szovitzianum they are quite free.

Lilium monadelphum is a native of the Caucasian region, and is a thoroughly good garden lily. Being an inhabitant of bleak districts it succeeds best in an open spot, and does not need any preparation of soil, for a good, well-drained loam suits it best. In common with many other members of the Martagon group, to which it belongs, this lily is not seen to any advantage the first season after planting, as then even good bulbs will frequently refuse to flower. The second year, however, better results may reasonably be anticipated, and under favourable conditions the display will continue to increase year by year.

G.M. 369

PYRETHRUM LANGPORT CRIMSON.

Flowers bright velvety-crimson. A.M., R.H.S., June 9; from Messrs. Kelway and Son, Langport, Somerset.

Lilium monadelphum, when well-established, pushes up a stout erect stem to a height of five feet or even more, and this is thickly clothed with pale green leaves. On strong plants the numerous drooping flowers are borne in large pyramidal heads. Individually they are about four inches long, and much the same across the expanded mouth, with regularly recurved segments. These are of a thick wax-like texture, while in colour they vary from pale straw-yellow to deep yellow. Some individuals are almost, or quite pure in tint, while others are freely spotted.

Like several of the Martagons the flowers are too heavily scented for close quarters, hence it must be regarded solely as an outdoor lily.

W. T.

DROUGHT-RESISTING BEDDING PLANTS.

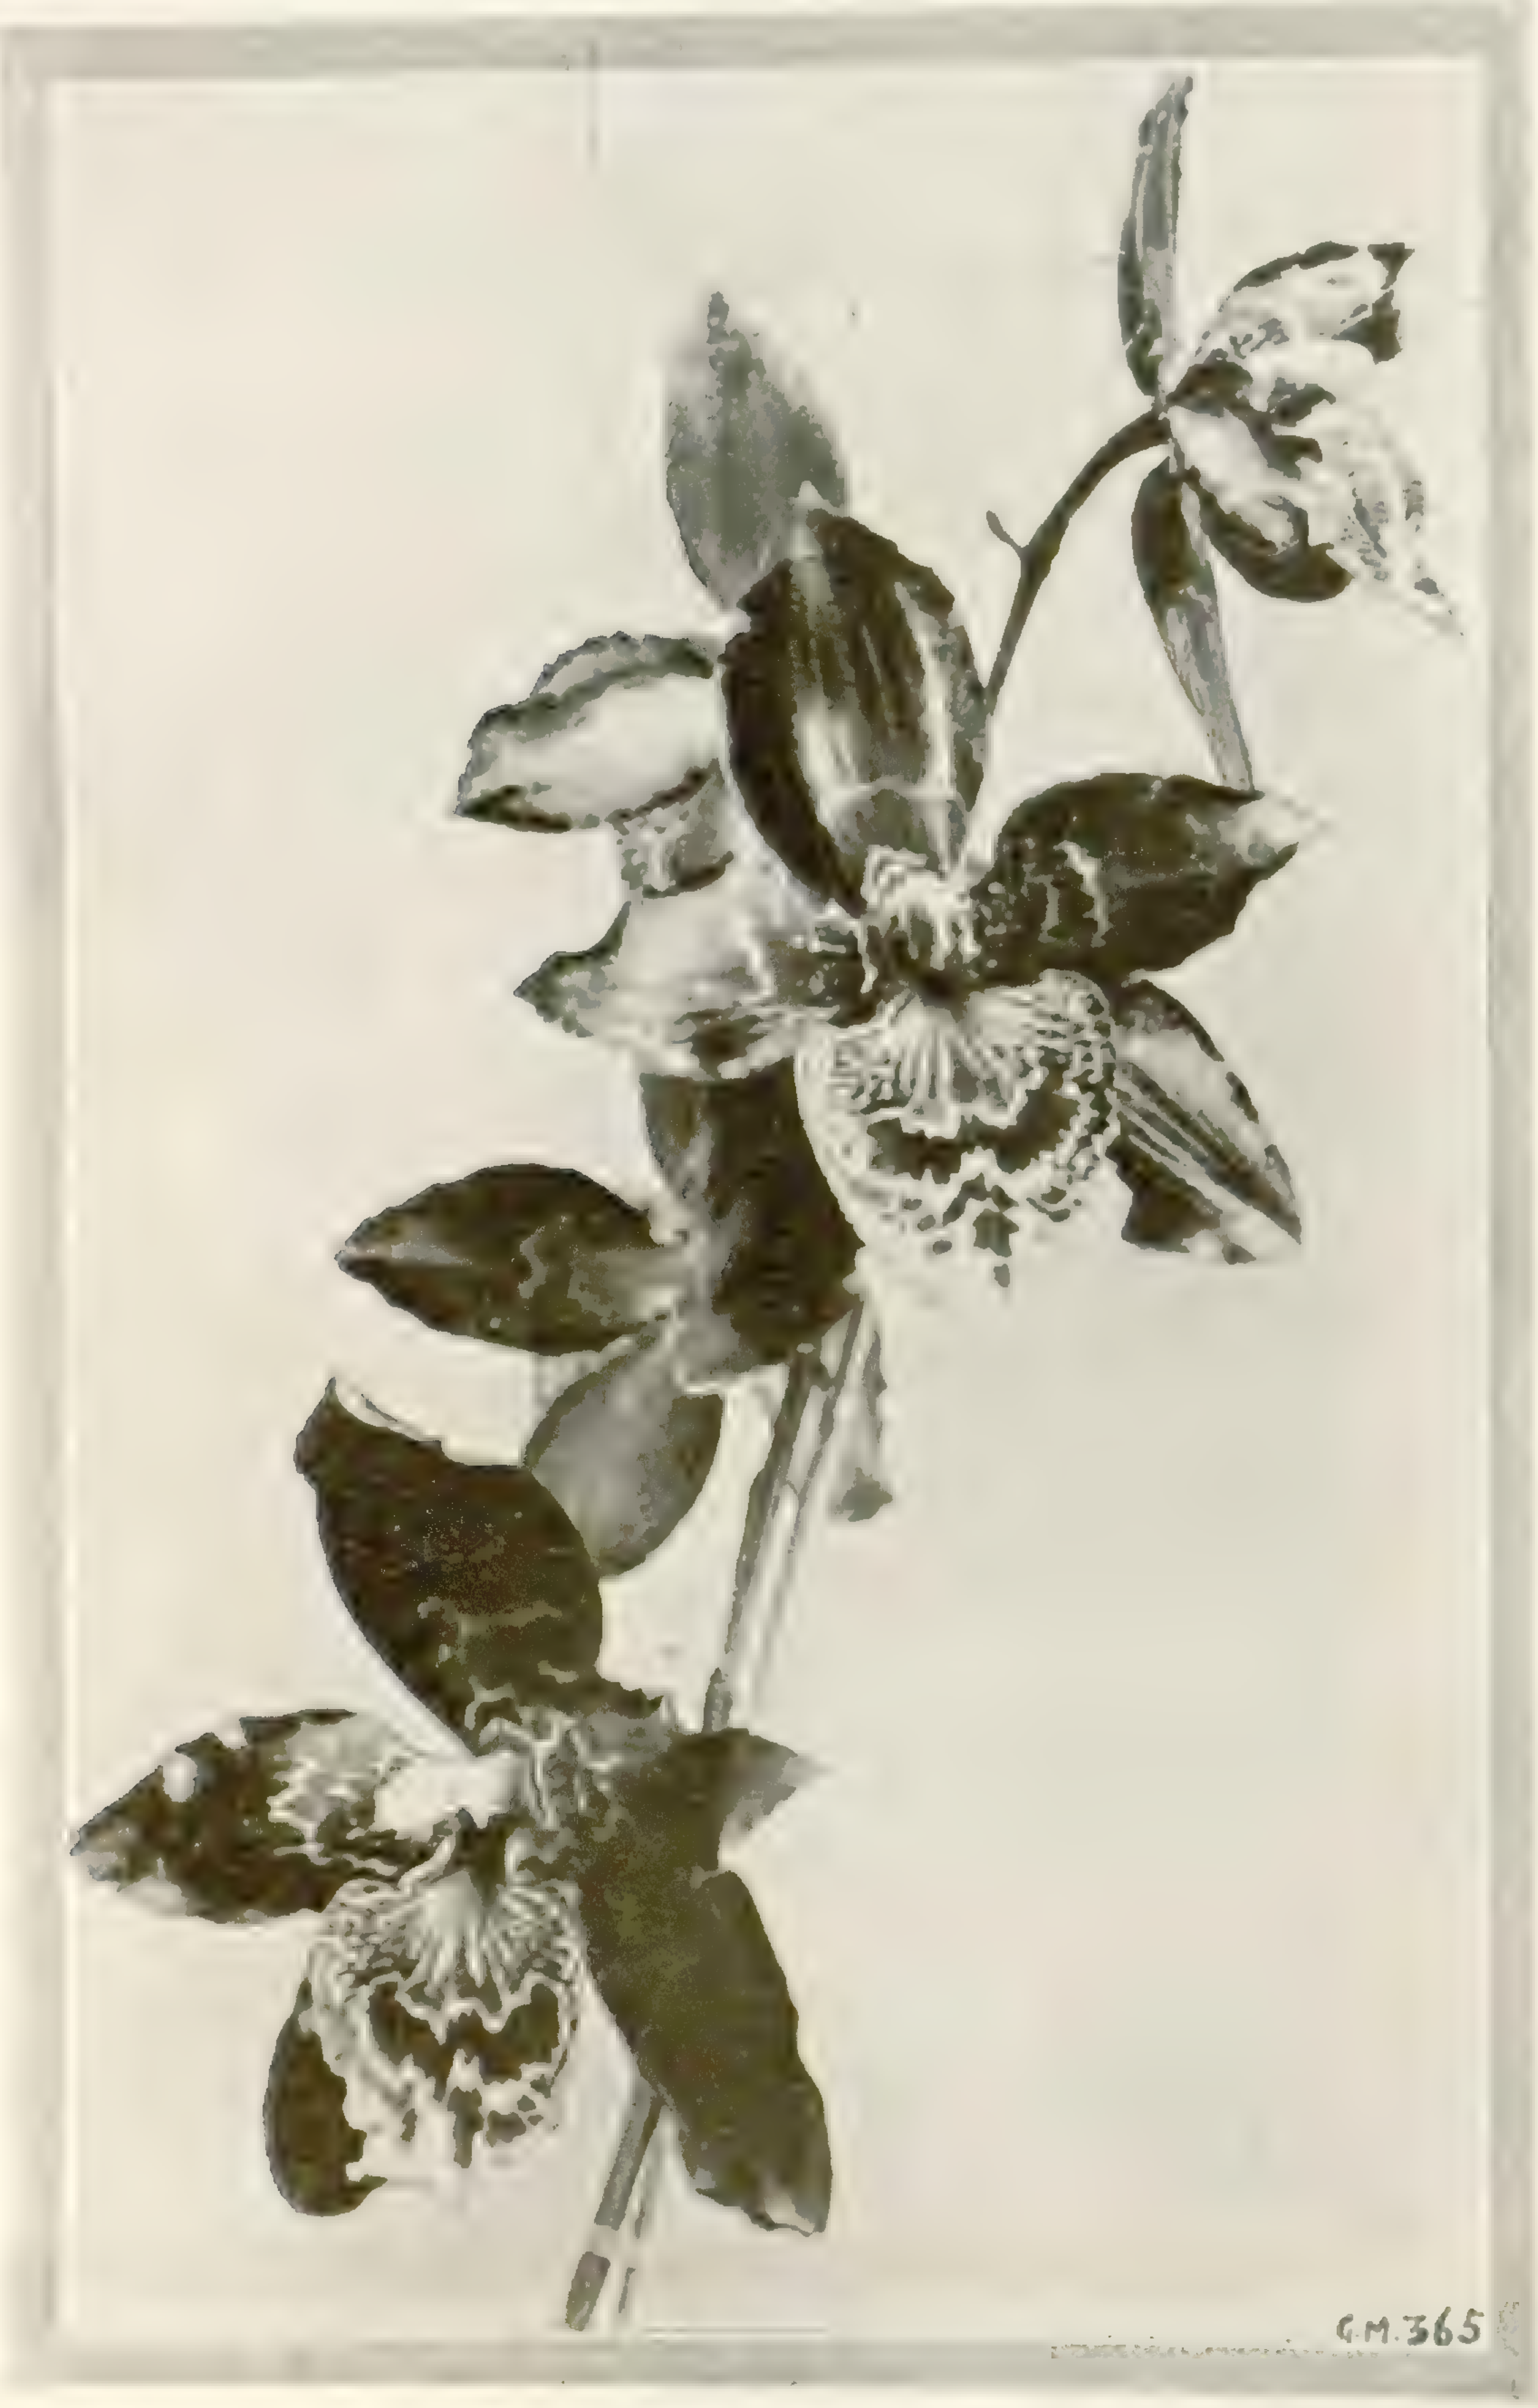
Plants that flourish and produce an uninterrupted succession of bloom during long periods of drought without artificial watering or assistance are extremely valuable, more especially in districts where the rainfall is small, or where considerable labour is involved in watering. Hot and dry positions, where the sun shines with all his strength during the greater part of the summer day exist in most gardens, and may well be planted with the subjects under notice

From time immemorial the antirrhinum has been known to excel in this direction, and it is difficult to understand or explain how the plants extract sufficient nourishment and moisture from a dry brick wall to support a great wealth of inflorescence. These plants have been prominent in the van of floral progress, and we now possess a large number of exquisite varieties. The rose-coloured and pure white varieties are very fine, and few plants surpass them for beautiful effects when employed for bedding purposes. Petunias, too, are superb dry weather plants, and flower with far greater freedom in a comparatively poor and dry soil than in heavily manured and moist ground; in fact, under the last-named conditions over-luxuriance is produced at the expense of the floral display. I have seen dry banks planted with petunias with splendid results.

The same remarks apply to nasturtiums of all sorts, and how infinitely superior are the new and named kinds to the old varieties! Cloth of Gold is strikingly beautiful, with rich golden foliage and scarlet flowers, which are thrown well above the leaves: Silver Queen has white and green foliage, and is a great beauty. The French marigolds must be included in this category, and the more refined varieties of comparatively recent introduction are very fine garden plants, and lend considerable brilliance in late summer, and until cut down by frost. The bold and aggressive African marigolds seem incapable of withstanding a long and continued drought, but verbenas call for attention, and it is interesting to note that they have to a great extent regained their old popularity. Such beautiful varieties as Defiance and Miss Wilmott have done much to bring this about, and surely we have few plants to surpass them as carpeting material, to say nothing of their value in pots, vases, hanging baskets, window boxes, etc.

Zinnias behave splendidly under dry conditions after their roots have penetrated the soil deeply, but bold and showy as they are, they cannot lay claim to being artistic in any sense of the term. The portulacas are second to none for dry spots, and in my younger days they were universally cultivated, the most exposed and dry positions being allotted to them, but they are anything but a success in a wet and sunless season.

Walter H. Aggett.



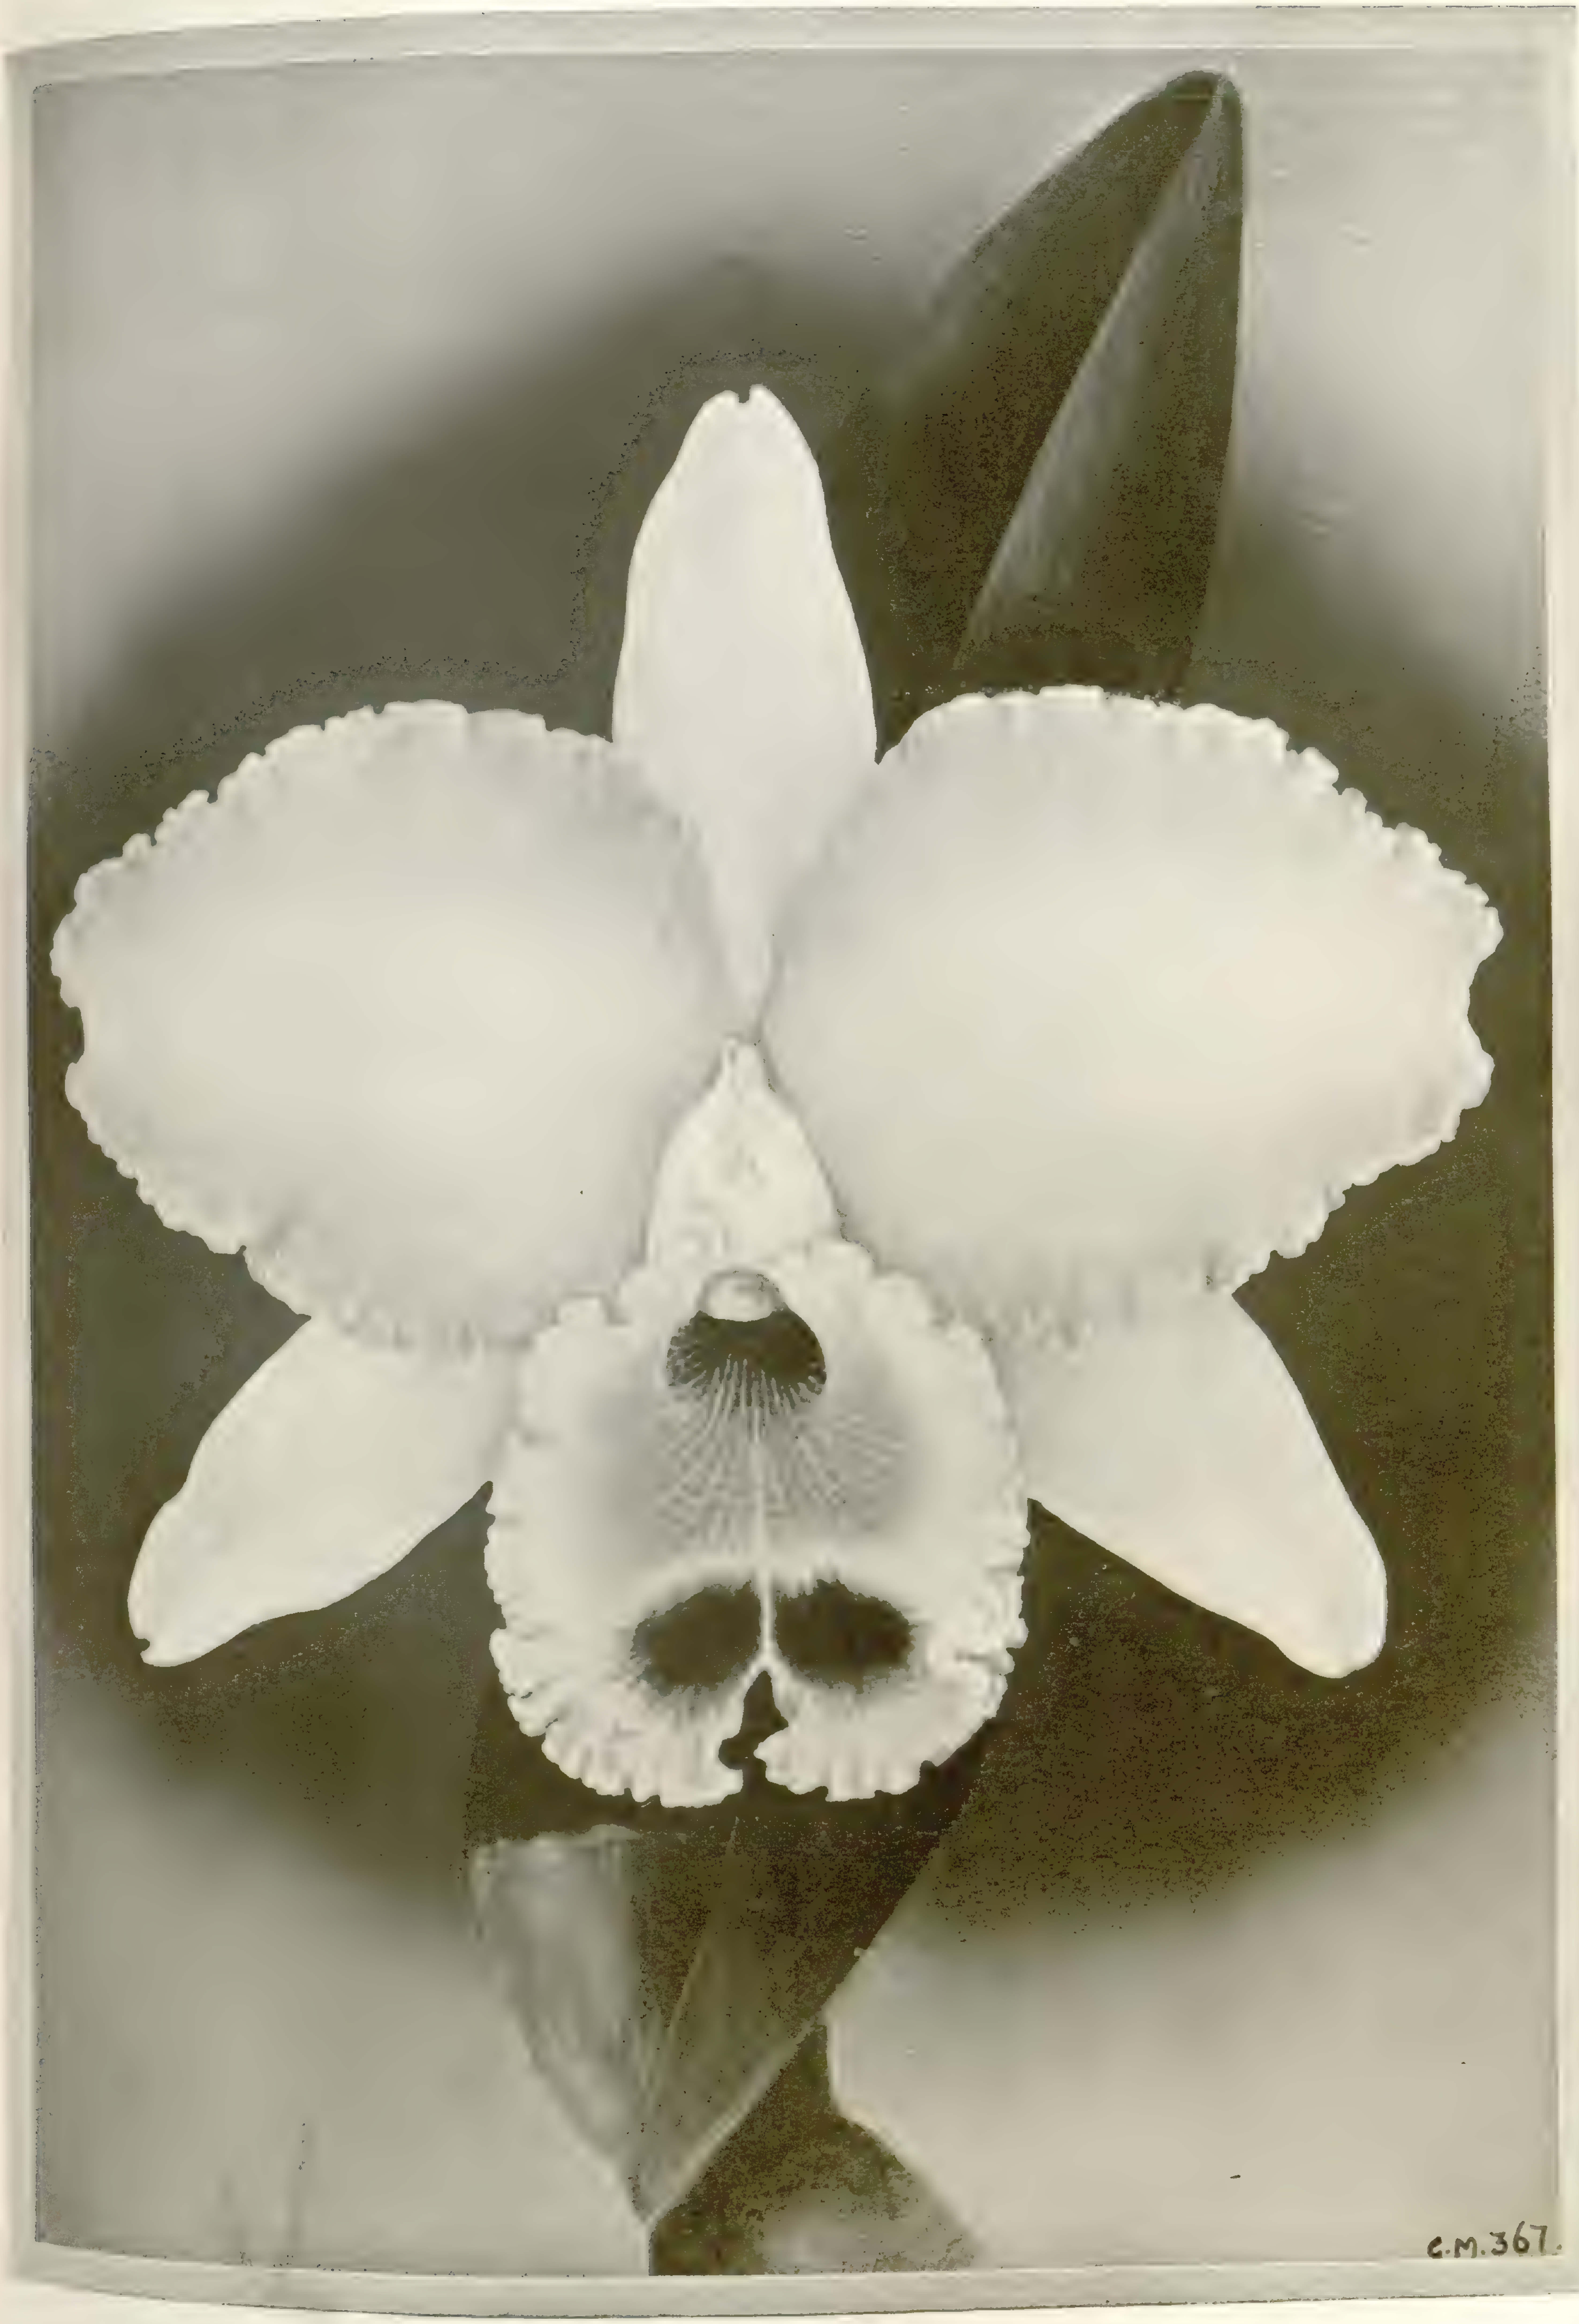
ODONTOGLOSSUM QUEEN ALEXANDRA, VAR. CRAWSHAYANUM.

Flowers brown, yellow, and white and purple. F.C.C., R.H.S., June 9; from De Barri Crawshay, Esq., Rosefield, Sevenoaks.

CATTLEYA MENDELI HIS MAJESTY THE KING.

It is many years since a variety of Cattleya Mendeli was awarded a First Class Certificate, but all who saw the exquisitely beautiful variety named His Majesty the the King, shown by Mr. Hopkins, gardener to Francis Wellesley, Esq., of Westfield Common, Woking, at the recent Temple Show, will agree that in this case the higher award granted was thoroughly merited. The splendid form of the flower as well as its delicate colouring and the delightful frilling of the lip all go to make this cattleya one of the best brought forward for many years. We were unable to secure a photograph of C. Mendeli His Majesty the King at the Temple Show, but Mr. Wellesley very kindly sent us Mr. Lamont's beautiful painting of the variety, and from this the present reproduction was made. The illustration gives a very good idea of the variety in all save the colour tinting, but is is of special interest because Her Majesty the Queen has been graciously pleased to accept the painting from which it was taken. The Queen greatly admired this noble orchid during her visit to the Temple Show, and was pleased that it had been named after the King, consequently Mr. Wellesley had the flower painted for Her Majesty's collection.

Planting Out Arums. — We often hear how successful some cultivators are with these plants who rely upon planting out. Doubtless much of the success is due to attention after planting, careful lifting in the autumn, and other cultural details. I have secured good results by a combination of the two methods usually adopted. I find I get much earlier flowers by potting and plunging the pots well over the rim during the growing season. When the plants are housed in the winter the pots are full of roots, and flowers appear much sooner than from lifted plants, which have to make new roots before they flower, a check being unavoidable when potting. It may be urged that plants with a mass of healthy roots soon make new growth, but as the potting does not take place till September, and often later, in open weather, growth at that season is not so rapid as earlier, and I find it impossible to do the work, no matter how carefully lifted, without loss of some leaves and roots. The earlier these flowers are produced in the winter months the more valuable they are. With a deficiency of large flowers in midwinter, the arum is one of our most useful plants, as five or six blooms in a large vase, with a few leaves, is an effective arrangement that lasts a long time in perfection.—T. B. Field.



G.M.367.

CATTLEYA MENDELI HIS MAJESTY THE KING.

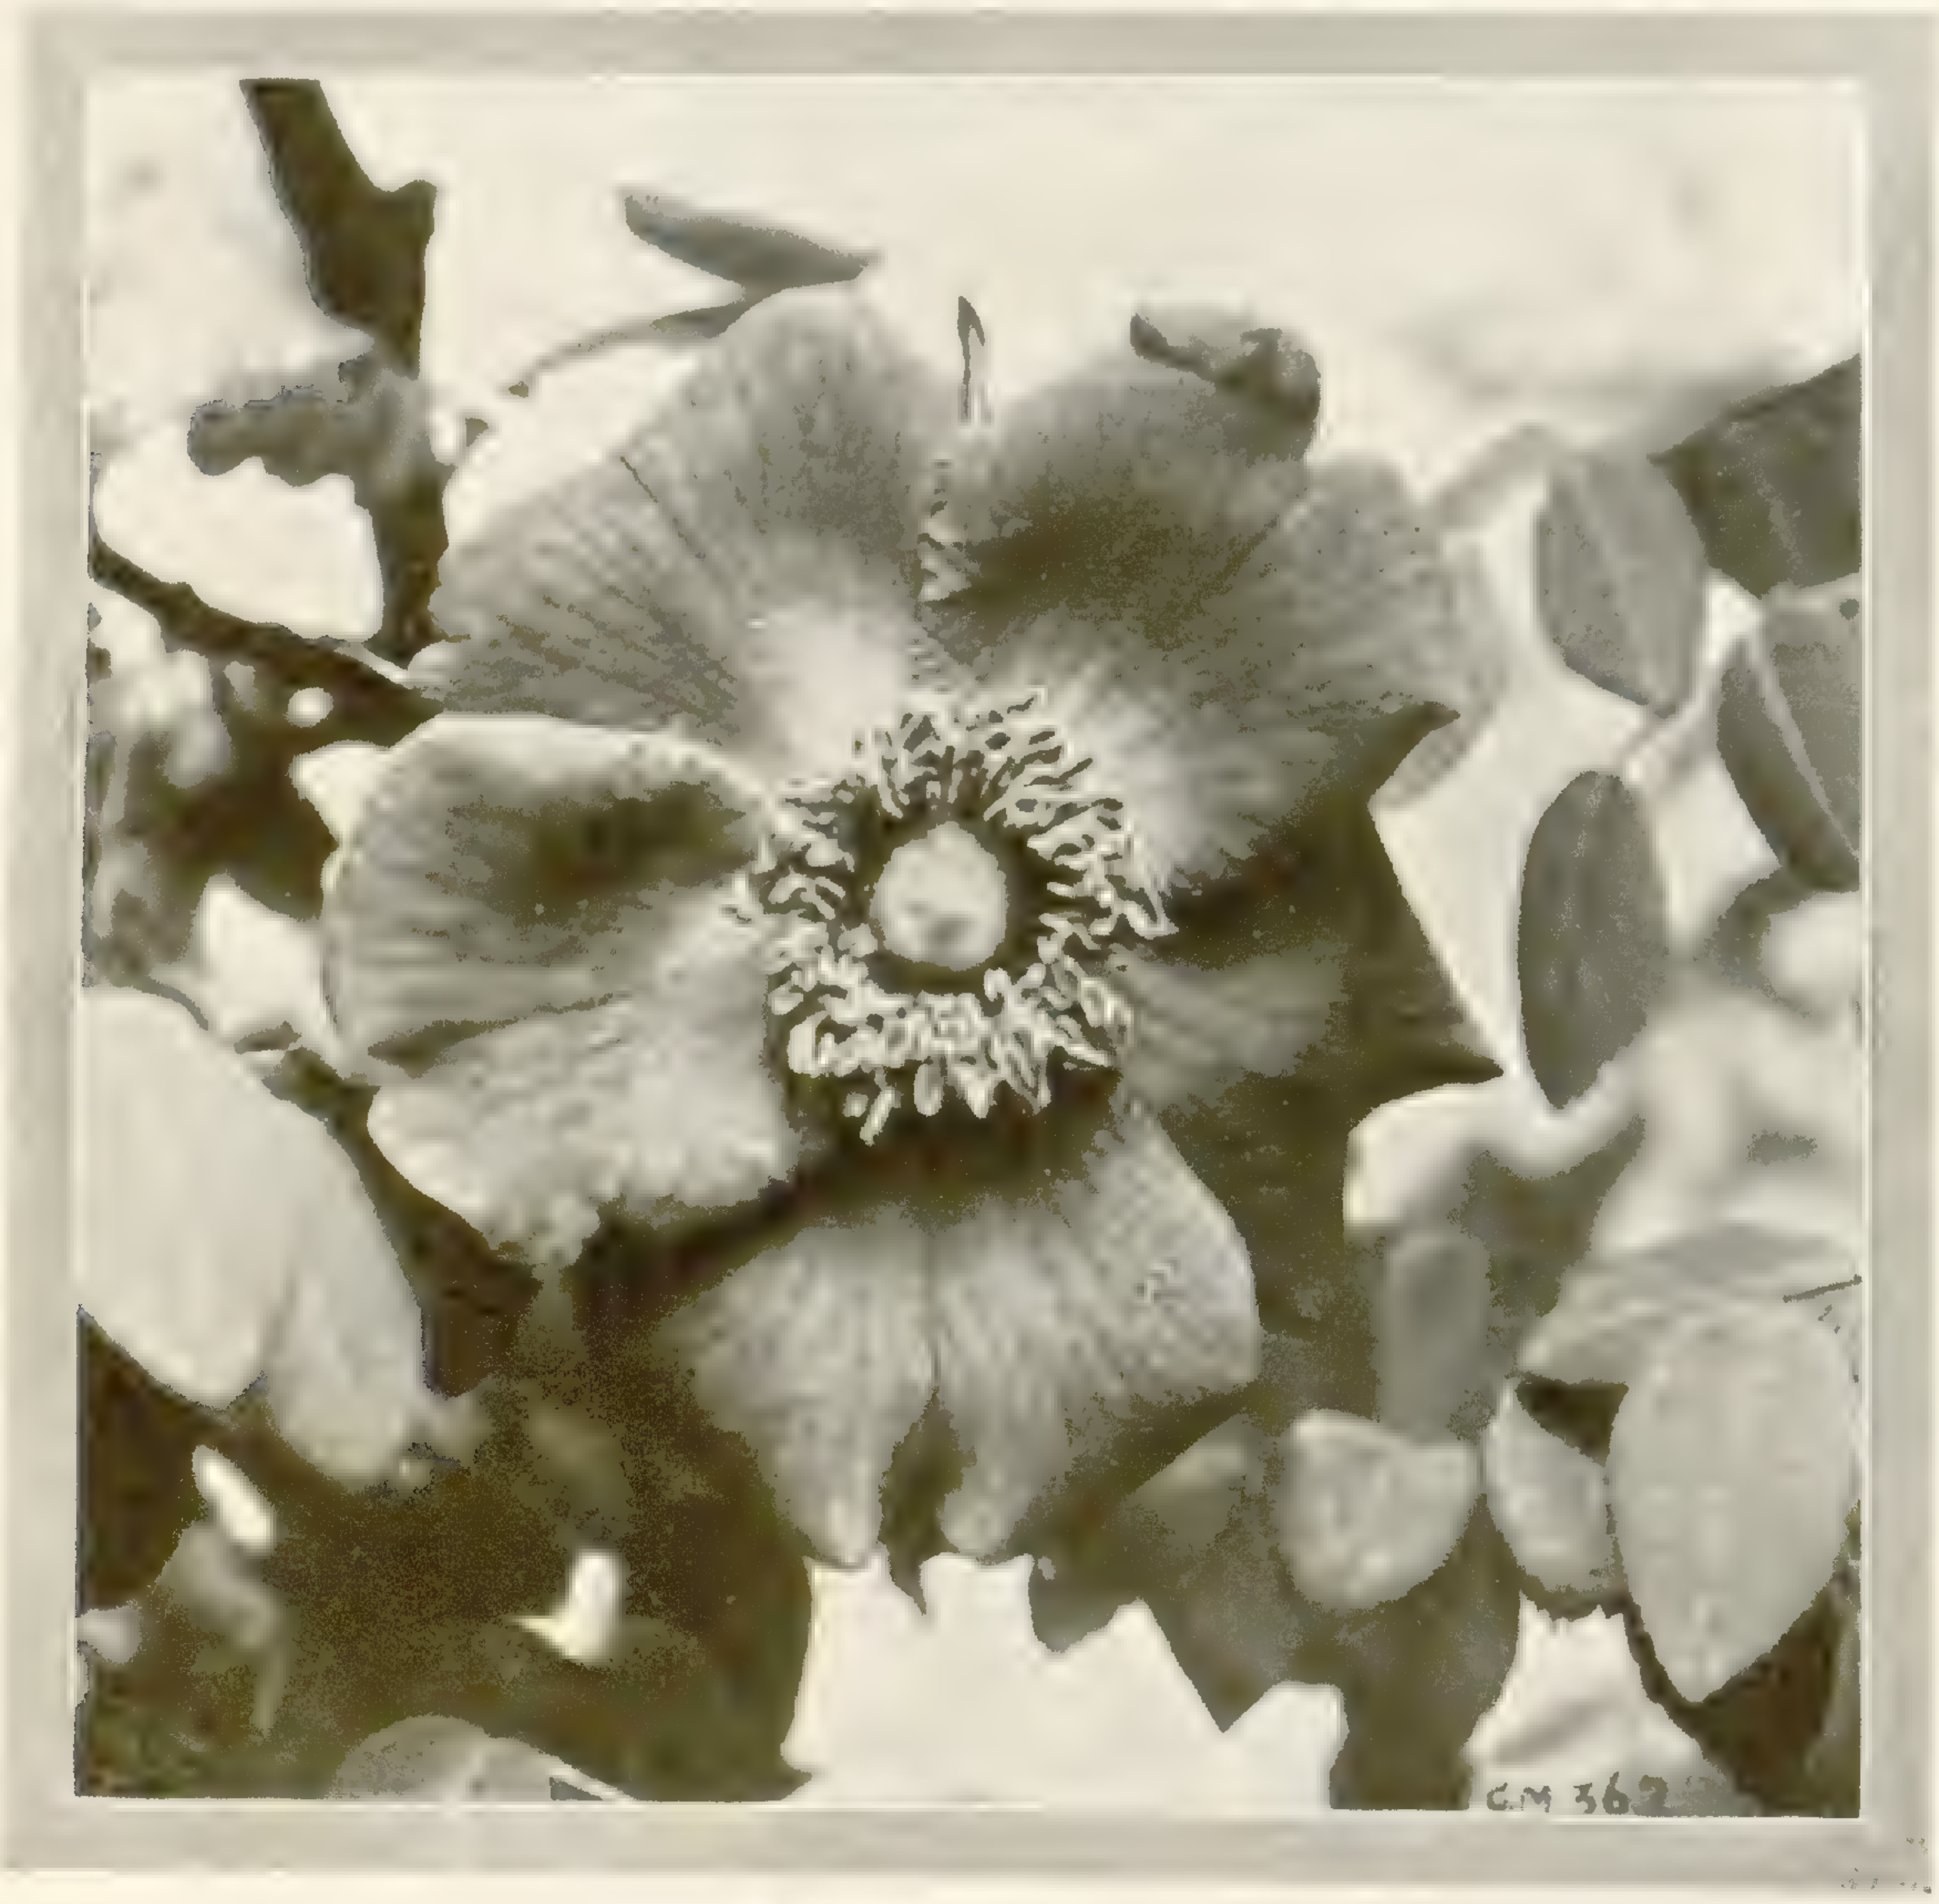
From Mr. Lamont's painting presented to Her Majesty the Queen by Francis Wellesley, Esq.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM QUEEN ALEXANDRA VAR. CRAWSHAYANUM.

A fine odontoglossum, obtained by crossing O. triumphans with O. Harryanum, and we should expect that Mr. Crawshay's fine O. triumphans Lionel Crawshay was the form used as one parent, because the shape of the flower, and the breadth of the sepals and petals, all suggest that splendid variety. The sepals and petals have a yellow ground colour that appears in thin marginal and irregular cross lines between the large areas of bright red-brown colouring. The flattish lip has a creamy-white apex, but the rest of this organ is handsomely marked with bright red-purple. F.C.C., R.H.S., June 9. De Barri Crawshay, Esq., Rosefield, Sevenoaks. (Gardener, Mr. Stables.)



ROSA MOYESI.
Flowers rich rose-red. A.M., R.H.S., June 9; from Messrs. Jas. Veitch and Sons, Chelsea.

MILTONIA ST. ANDRE.

A beautiful variety, obtained by crossing M. Roezli with M. Bleuana Sander's var. The flowers are flat, but of more rounded outline than in most forms. The sepals and petals are white, save for the pretty bright purple shading on the basal halves of the petals. The white lip has a red-brown radiating blotch at the base, and a few lines of colour run beyond the blotch itself. F.C.C., R.H.S., June 9. Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham.

ODONTOGLOSSUM GLORIOSUM CITRINUM.

In this distinct variety the brownish markings found in the type have all disappeared, leaving the flowers wholly of a pale yellow colour, with a few deeper shadings of yellow. A.M., R.H.S., June 9. Messrs. J. and A. McBean, Cooksbridge, Sussex.

ODONTOGLOSSUM PHŒBE, DELL VAR.

The most beautiful of the several charming hybrids derived from O. cirrhosum crossed with O. crispum. The plant shown carried a good spike of showy flowers. The ground colour is blush-white, and this is heavily blotched and spotted with rich bright red-purple. The flowers are of good size, the segments being pointed, and suggestive of O. cirrhosum. F.C.C., R.H.S., June 9. Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham.

MILTONIA BLEUANA STEVENSI.

This pretty variety has M. Roezli alba and M. vexillaria Leopoldi as parents. It is very free flowering, but the individual blooms do not reach the size of those of the finer forms of M. Bleuana, such as M. B. nobilior. The flowers are white, with radiating red-brown markings at the base of the large lip. A.M., R.H.S., June 9. Mr. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone, Staffs.

DEUTZIA WILSONI.

A bold and handsome species from China, discovered by the collector whose name it bears. It grows sturdily and flowers freely, producing terminal and axillary spikes of pure white flowers in great abundance, and these are well set off by the lanceolate, opposite, deep green leafage. The stronger growths, clothed throughout the great part of their length with spikes of bloom, are very graceful, and there should be a great future for this useful addition to our early summer flowering hardy shrubs. A.M., R.H.S., June 9. Messrs. James Veitch and Sons, Chelsea.

ROSA MOYESI.

A very distinct Chinese species of dense habit, and with very spiny growths and leaves. The latter have, in most cases, nine or eleven pinnæ, and they are very deep green. The flowers are nearly three inches across, rounded, single, and made up of very thick, substantial petals. The colour is deep rich rosy-red, but the buds are of brighter hue. This new rose should prove of great value in the creation of a new race of garden roses. A.M., R.H.S., June 9. Messrs. James Veitch and Sons, Chelsea.

ZEPHYRANTHES AUREA.

An exquisitely beautiful Peruvian species that bears trumpet-shaped flowers of the richest golden-yellow colour. The flowers measure about three inches across at the mouth. The deep green narrow leaves are slightly glaucous beneath. A.M., R.H.S., June 9. Mr. Bain, gardener to Sir T. Lawrence, Bart., Burford Lodge, Dorking.

PHILADELPHUS LEMOINEI ROSACE.

This is a semi-double variety of the now well-known P. Lemoinei. The varietal name is suggested by the appearance of the white double flowers, as they are very like the blooms of some small, semi-double cluster rose. Short flowering shoots only were shown, and these began to droop early in the day, so that the beauty of the variety was not evident to many visitors. A.M., R.H.S., June 9. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking.

IRIS CARTHUSIANA.

Although this has a general resemblance to the popular Iris dalmatica pallida, it is quite distinct from that variety, and promises to become a first-rate garden plant. It has fine tall spikes of large shapely blooms, the latter being very pale blue with deeper veins. There is a heavy yellow beard or crest on each of the broad falls, and the base of each fall is white, marked with irregular lines of yellow-brown. I. Carthusiana is slightly fragrant, and it has [illegible] greener foliage than I. dalmatica pallida. The latter variety was one parent and an unnamed Syrian species the other parent. A.M., R.H.S., June 9. J. W. Marshall, Esq., Charterhouse, Godalming.

PYRETHRUM LANGPORT CRIMSON.

A fine new single pyrethrum of large size and excellent form. It is a strong-growing variety, and the blooms are vivid rich velvety crimson. A.M., R.H.S., June 9. Messrs. Kelway and Son, Langport, Somerset.

CARNATION SNOWBALL.

A good white carnation that is the result of crossing a good border variety with one of the perpetual flowering varieties. The flowers have a smoothness, fulness, and substance that appeal to the florists, while the purity and size of the blooms, as well as the length of stem, will appeal to the market growers and decorators. A.M., R.H.S., June 9. Mr. H. Burnett, Guernsey.

STOCK VEITCH'S MAGENTA STRAIN.

A splendid strain of the old English Brompton stock; it produces splendid [illegible] of big blooms, and the colour is rather [illegible] crimson than magenta. A.M., R.H.S., June 9. Messrs. R. Veitch and Son, Exeter.

RHODOTHAMNUS KAMTSCHATICUS.

A charming little rhododendron-like alpine shrub, bearing clusters of magenta-purple flowers. It makes a little bush [illegible] eight inches high, and has hairy [illegible]. A.M., R.H.S., June 9. Mr. G. Reuthe, [illegible] Hill Nursery, Keston, Kent.

Vases on Terrace Walls and other places must not be overlooked, as they often complete a beautiful picture. See that drainage is in perfect condition, and use soil of good lasting quality, though open and porous, with an addition of bonemeal. Numerous plants are suitable for these [illegible] from the noble agave, surrounded by [illegible] crops, portulaccas, or mesembryanthemums, to the smaller annuals. Where there is a number of vases on terraces they [illegible] where possible, be arranged in pairs, keeping the brightest colours to the most important parts. The zonal pelargoniums are among the most suitable with ivy-leaved varieties. Queen Alexandra marguerites, fuchsias, petunias, heliotrope, ageratums, lobelias, nasturtiums, convolvulus, [illegible] lantana, Cordyline indivisa, dianthuses, [illegible] Drummondi, stocks, etc., etc., may be [illegible] Where there are large central vases, five to ten feet in diameter, noble effects [illegible] be made in these by using Zea japonica variegata, cannas, tobaccos, ricinus, Chilian beet, liliums, etc., in addition to some of the previously-named subjects.—E. F. Hazelton.

THE LEEK.

During recent years the leek has been much improved by experts both as regards size and appearance, and possibly also in hardiness and quality. Be this as it may, the medical profession appear to be quite unanimous in their opinion of the dietetic value of this vegetable. Judging from the huge quantities grown for market, and the continual demand for them in private establishments, leeks are rightly rising in popular favour, and are grown on a larger scale than formerly.

The culture of the leek is not so exacting as that of many crops, but if good produce is required the needs of the plants must be supplied. Extra large specimens for special purposes necessitates very early sowing under glass, and the potting or boxing up of the plants, and their being grown under glass protection till April or May, according to condition of weather. Then they must be planted out in richly manured trenches, and after the plants are well-established artificial manures may be applied with advantage, periodically, by sowing safe quantities along the trenches during rainy weather, or watering it in on fine days.

But for the usual kitchen supplies this high culture in trenches is not necessary, or even desirable, as the same amount of time and labour entailed may be made to produce a greater number of good medium, useful, and in many ways more profitable roots.

If seeds were sown thinly in March in the open this would be sufficiently early to provide suitable sized plants for the main plantation in June. In gardens where close cropping has to be considered, planting may be deferred by pricking out the young plants in nursery beds, at about six inches apart, where they may remain until a crop is removed from a suitable quarter.

If the ground has been manured for the previous crop no extravagant preparation will be needed, but the ground must be forked over, and the plants carefully lifted with their roots intact from the nursery bed, and planted twelve inches apart in lines from fifteen to eighteen inches from line to line. Where space is not a consideration the final planting may be carried out direct from the seed-bed at the above distance. A dibber is sometimes used for planting this crop deeply, but to my mind a trowel is preferable, as the roots are thus better distributed in the soil. In either case make the plants firm by carefully and deliberately pressing the soil round them, afterwards apply a good soaking of water.

The leek, with its decidedly gross habit, grows better in strong moist loam than in light ground, but with attention to watering should the weather prove dry, and with an application or two of a good artificial manure, it will thrive satisfactorily on even peaty soils. The danger with such land is that they may be stunted from insufficient root moisture. Once a serious check takes place the leek rarely makes robust growth again, despite every attention that may be given it. At all times keep the plants free from weeds, and from time to time stir the surface soil with a hoe or give a light forking over.

During the later stages of development the soil may be gradually worked up to the plants to blanch the stems without covering the centre leaves. With these small details carried out they will arrive at a size sufficient to give satisfaction towards the end of the year without serious outlay in labour, and will prove most useful where large supplies of vegetables have to be provided.

The English winters are uncertain, often damaging the more tender vegetables during sharp frosts and causing scarcity, but the leek stands the sharpest and severest weather with impunity, and never fails us, giving a supply of produce throughout seven or eight months of the year, and this alone is sufficient to place it amongst the best selection of vegetables.

Cholmondely Castle Gardens.

A FLORAL SUN-DIAL.

As mentioned in my article on "Sun-dials in the Garden," which appeared in the Christmas number of the Gardeners' Magazine for the year 1901, floral dials, or, to be strictly accurate, sun-dials formed with living plants, have not been plentiful in British Gardens at any period since sun-dials came into use in this country. At Wentworth Castle one was formed many years ago with dwarf box, planted to form the proper numerals and kept closely clipped, and a clipped yew in the centre to act as the gnomon. A dial of a similar character is illustrated in Loggan's "Views of Cambridge," and described as having been in the garden of Peterhouse College in 1675. Within a quite recent period a dial similar to that at Wentworth Castle has been made at Easton Lodge, Dunmow, the Essex seat of the Earl and Countess of Warwick, and of this I have pleasure in giving an illustration herewith. The dimensions of the dial, as kindly given me by Mr. H. Lister, the able head gardener, by whom the dial was made are: diameter of the dial, with its figures, 4ft. 6in.; depth of letters, 18in.; and the height of the yew gnomon, 11ft. The inscription surrounding the dial is: "Les heures heureuse ne se complent pas." The dial occupies a position in a somewhat secluded and a delightful part of the gardens, and constitutes a very interesting feature.

In the gardens of Easton Lodge, Dunmow.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ORCHIDS. — The early-sown seed of the cattleya and lælia families should by now have produced seedling plants with their first leaves. As it is at this stage that the roots are formed opportunity should be taken to transplant the seedlings. There are different methods of transplanting or pricking out the seedlings. Some prefer to prick out several together in 3in. or 4in. pots. This is not at all a bad plan, because, owing to the greater bulk of material in the pots the compost does not dry so quickly, although I prefer to prick out singly in small pots, as I consider greater progress is made by the plants. We use for small seedlings a compost consisting of about equal portions of fibrous brown peat, broken oak or beech leaves, and chopped sphagnum moss, with sufficient sand and broken crocks intermixed to keep the compost open and porous. Care should be taken to see that the potting compost is moistened through after potting.

THE PROGRESS MADE with seedlings naturally depends on the treatment the young plants receive. If they have been kept in the close propagating case right up to the time at which they are pricked off, they are very liable to become checked in growth if they are not again placed in a close atmosphere until they become re-established. It is a good plan to harden the seedlings while in the seed pan to the conditions under which they are likely to be treated, a few days before pricking them off. Seedlings of all kinds are benefited by warmer conditions than that normally given to the genera to which they belong. The warmer conditions must also be accompanied by more humidity in the atmosphere, especially during the hot summer months. The fact should not be overlooked that it is desirable to keep all this class of seedlings in an active state of growth, right up to the time at which the flowering stage is reached. If these conditions are afforded, the length of time between seed-sowing and flowering is considerably shortened. Seedling orchids should also be placed in a position within a reasonable distance of the roof glass, a fixed shelf from 15 to 18 inches from the roof glass is very serviceable for this purpose. Spraying the plants overhead with the syringe in bright, warm weather will be found beneficial.

SHADING.—I have pointed out that it is desirable to afford all the light possible, but care must be taken to bring the roof blinds into use as soon as there is danger of scorching the young leaves. For dendrobium seedlings the treatment is practically the same as that recommended above. Calanthes should be pricked off as early as possible, as they commence rooting as soon as the first leaf has been developed; they should then be pricked off, two or three together, keeping them close to the edges of the pots. They should have every encouragement to make a fine first bulb. We find peat and moss in about equal proportions a suitable compost for these. Phaius seedlings must also be kept in an active state of growth until they reach the flowering stage. The young plants should also be kept under warmhouse treatment.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

DIPLADENIAS.—These plants deserve more extensive cultivation, as their flowering season ranges over a period of four to six months, and where cut flowers are in demand for house decoration they are of great service. In growing dipladenias an essential item is the maintenance of a brisk temperature well charged with atmospheric moisture. When one cannot accommodate large specimens a batch of cuttings may be put in any time before the end of August, but the plants are best raised as early as possible if required for early spring flowering. They may be kept growing steadily throughout the autumn months, and kept somewhat drier at the roots during the winter months, raising the temperature as the new year arrives. For compost I have not found anything more suitable than peat and sand. The peat must be of the best quality, and when used for large plants it is advisable to shake out all the fine portion, using only the lumpy fibrous remains. Although dipladenias may be cultivated very successfully on the usual balloon trellises, one does not secure the best results under such cultivation. Where space permits the plants being used for covering the roof of the plant stoves, it proves much more useful, and during the summer months its beautiful floral display will command the appreciation of everyone.

EUPHORBIA JACQUINIÆFLORA.—A further batch of plants of these useful winter-flowering subjects may now be raised from cuttings inserted in small 60-sized pots, as previously recommended. The earlier rooted plants will also require attention to potting and training. Where specimen plants are desired I strongly recommend bending the points down, which is preferable to pinching out the points, as it induces more eyes to break into growth. Continue to grow the plants as near the glass as possible, and afford as much light as the plants will stand; a thin shade, however, is desirable during the hottest part of the day.

POINSETTIAS.—Where small plants are used for decoration the dwarf poinsettias are exceedingly valuable. During the winter months they may be found useful for table decorations, and will greatly assist in prolonging the season of cut flowers. For this purpose a batch may be raised during the next two months in batches at intervals of a few weeks.

CROTONS.—Autumn-raised plants will grow into useful sized plants for winter and early spring decoration, and larger specimens which have become unsightly through the loss of foliage, but yet have good tops, may be notched and mossed; as soon as the material is well filled with roots the heads ought to be separated gradually from the parent plants and potted up; shading them from the hottest part of the day, and occasionally syringing the plants overhead will greatly assist root action. The larger specimens will also require feeding; give a weekly top-dressing of some approved chemical fertiliser, with an alternate application of weak liquid manure. An occasional watering of clear soot water will be found most beneficial.—John Donoghue, Bardon Hill Gardens.

FRUITS UNDER GLASS.

TOMATOES.—These will now require an abundance of water, especially those in large pots. They often fail to set in very hot weather, but a damping overhead in the afternoon will sometimes improve matters, but dryness at the root in summer time is the chief cause of failure. Top-dress those that are carrying a heavy crop. Keep all side shoots pinched out, and also the centre fruit of each bunch, as this will invariably be found deformed, or too large for culinary purposes; its removal adds strength to the better-shaped fruit round it, and for exhibition purposes even, round, and bright-coloured samples are required. To prevent disease keep the house well aired, and never allow stagnant moisture to stand in the house. For an early winter supply seeds may be sown at the end of the month.

MELONS.—If any fruits are left on the earliest batch it will be well to give shade in hot weather, as they often ripen too fast to be of good flavour; cut the branch half-way through if the fruits start cracking before they are fully ripe, and also keep less moisture in the house. Old plants should be removed as soon as the fruits are gathered. The second crop will be swelling up fast, and will take an abundance of clear and liquid manure water; sudden bursts of sunshine often burn the leaves that are covered with moisture, so syringing should be done early to allow them to dry. Where the roots are restricted, or growing on a stage-top, dress them with some good loam and old spent mushroom bed manure; thin out a few of the laterals, but this should be done carefully as it often induces canker. A little powdered charcoal may be placed round the stems. Seeds may be sown for a late batch, but melons are not required so much in the autumn, as there are then plenty of outside fruits.

PEACHES AND NECTARINES.—As soon as the fruits have been gathered give the early trees a good syringing with some insecticide, and if at all dry give the roots a good soaking of water. A little artificial manure may now be given if required, and the bed or top of the border be forked over. If not already done, mulch the border with some fresh stable manure, as this will help to keep red-spider down. Examine the trees, cut out old and useless wood, and get them to make good growth; throw the house open, and, if possible, remove the lights to get the wood ripened up for another season.

MIDSEASON HOUSES.—Where trees are carrying a good crop of peaches or nectarines they will require an abundance of water if the roots are in a proper position, but very often they are down below the proper ground level, and there is no proper drainage to take away the water, hence cold borders, sickly trees, and little or no fruit. Over-cropping is disastrous, but it is sometimes unavoidable, especially if some trees in the house have failed and a supply has to be kept up; these trees suffer for the failure of others. Keep such trees well syringed until the fruits show signs of ripening. If red spider appears dust the pipes over with sulphur, keeping the foliage quite dry for this operation. A little whitening may be syringed on the glass, if necessary. Gather the fruits in the early morning.

LATE VINES.—As soon as the grapes have been thinned give the vines a good soaking of water. Select well-placed shapely bunches, and crop the vines according to their strength. The pipes should be warmed at night, and a little ventilation allowed by the top ventilators. The front of the border, or where the sun strikes the hottest, may be mulched with some litter to keep it from drying up. A few laterals may be allowed to run at will, as these will keep up good root action. If red spider appears syringe in the early morning and afternoon with soft water, using a spraying syringe.

STRAWBERRIES.—As soon as layers can be obtained, place them in pots, using a stone to keep them down in the pot; these are preferable to pegs, as they keep the young plant cool. Keep the pots as close to one another as possible, as this saves time when watering. The pots should be clean, and have one crock each; use good loam and leaf-mould, or old horse manure.—A. B. Wadds, Paddockhurst Gardens.

THE KITCHEN GARDEN.

CARROTS.—Another sowing should now be made of one of the Early Horn varieties, which will furnish tender roots in the autumn and the early part of the winter. They may be presently protected from early frosts by placing bracken or spruce boughs over them. The main crop should have attention, and if there are any blank spaces in the rows, seeds of an early variety should be sown to fill up the vacancies, which will give the main crop a much better appearance.

BEET.—The same remarks also apply to beetroot, choosing the Globe variety to make good the losses. But I have often filled up vacancies with the thinnings, and if done in showery weather and attended to, they will make most useful roots. Keep the soil well stirred between these root crops, which will greatly assist growth, and also give a sowing of old soot when the foliage is damp.

WINTER VEGETABLES.—Make good any losses in the quarters that have already been planted, choosing a showery day for the work. But should the weather remain dry, watering will have to be attended to. Break the soil up between the rows with the hoe, which will tend to check weeds, and also benefit the plants.

OUTDOOR TOMATOES.—Those that are planted against walls or trained up stakes should have all side growths pinched out, and be kept to single stems. When four or five trusses of bloom have formed the leaders should be stopped, for they do not as a rule ripen more fruit. Give the plants plenty of water, and a little stimulating food when the trusses have set and the fruits are swelling.

MULCHING.—On light soils the mulchings of peas, runner beans, etc., should be given without delay, as it proves so helpful to these crops, and keeps them from suffering from drought. If stable litter is not available, old spent mushroom bed manure, or even the grass cuttings from the lawns, would be better than nothing. It is surprising what benefit these top-dressings give, especially in hot, dry weather.

FRENCH BEANS.—Continue to sow small batches of these out in the open ground, and for general use Canadian Wonder is still one of the best. If a little colour is required Golden Waxpod should be sown, as it is most attractive. Select nice good soil for French beans, so that they may grow on without a check.

PARSLEY.—This is in request almost daily, and to obtain a supply during the winter and spring months, a good bed should now be sown. Parsley requires a somewhat strong soil, which has been previously manured, and when the seeds are sown they should be trodden down, as the plants like a firm root-run.

LATE PEAS.—Autocrat and Late Queen should now be sown for giving a few dishes in the autumn. Sow the seeds thinly in shallow trenches, and on ground that has been trenched. Attend to other peas that are coming into bearing, as regards watering, and stick the rows that are coming on for succession.

CHICORY.—In some establishments this is frequently used, both the foliage and the roots, the latter making a delicious salad. It may therefore be necessary to sow some in lines about a foot apart, thinning the plants out when they are ready to about 15 inches.

VEGETABLE MARROWS.—The plants that were raised early in the season are making good progress; stop the shoots, and thin out the foliage so that sun, light, and air can reach them. The last batch of plants should be planted now on hillocks of loam; placed on manure heaps, they will give small, tender marrows later on in the season, providing early frosts keep off.—T. W. Birkinshaw, Hatley Park Gardens.

BRITISH PLANTS FOR BRITISH GARDENS.

Among the interesting "Notes of the Week" ("G.M.," May 23) appears one on the Bluebell (Scilla nutans), and the glorious effect it produces when it gems the glades and slopes with its superb carpet of deep blue. The extreme value of this, and kindred native flowers, is beginning to be more fully realised in these days of garden progress, and doubtless as time speeds on, and the love of natural gardening extends, a whole host of our charming native plants will be lifted to a higher plane, and meet with the approval of all who are in favour of English flowers for English gardens.

It is as well, now that the delightful phases of natural gardening, such as the wild garden, the rock garden, and the waterside garden are enjoying such a measure of deserved popularity, that attention should be more closely directed to the various native plants, in order that a more extended use may be made of them when the planting of glades, grass land, and watersides is in progress.

I am well aware that already many native plants appear in the herbaceous borders, but it is my desire that the many pretty scenes of floral beauty which occur in out-of-the-world spots in rural England should be reproduced in all their charm and interest in the gardens of those who love dainty effects.

One has but to refer to the aquatics and waterside plants associated with the water garden to realise in part the glorious possibilities of our England plants. We should acquaint ourselves with the beauties of the spiræas, epilobiums, lysimachias, lythrums, irises, etc., which afford such pleasing displays to the margins of the waterways; and realise the glories of such semi-aquatics as the king-cups (calthas), with their golden masses of colour, or the delicate blue sheets of myosotis, and the yellow of the mimulus.

With reference to the true aquatics one might well plant the water garden proper with such useful and pretty flowers as the native nuphars and nymphæas, the charming alismas, the floriferous Ranunculus aquatilis, the ever-popular Hottonia palustris, Menyanthes trifoliata, villarsias, etc., which could be supplemented with the sagittarias, stratiotes, hydrocharis, sparganiums, and many others, all of which are approved favourites.

Leaving the water garden one is confronted by a whole host of plants which may be readily utilised for naturalising in various positions in the wild garden. The varied scenes of the wild garden, which include the planting of grass land stretches, the beautifying of knolls and banks, the carpeting of the woodland floors, and the adornment of rock ledges, open out a vista of great possibilities for the native plants. In addition to the bluebells, one can utilise anemones, cowslips, primroses, hardy orchids, campanulas, narcissi, linarias, sedums, saxifrages, verbascums, veronicas, gentians, achilleas, [illegible] senecios, centaureas, valerians, potentillas, lathyrus, geraniums, hypericums, linums, cerastiums, dianthus, saponarias, silenes, lychnis, violas, papavers, thalictrums, clematis, and a whole host of other British plants.

The more one realises the wealth at hand, and its full possibilities, the easier will it be to produce rural beauty spots in the garden; and apart from the picturesque character of the wild garden, there is also a great educational interest attaching to the study of our native flora. That much remains for the keen observer to search out and note in the study of our native plants I am more than convinced. For instance, among large colonies of the early purple Orchis mascula, one may sometimes meet with the greatest variety of colouring, forms of pink, other lilac, some practically a violet hue, while others again may be marked with green, though this last I have only noted in the pale hued forms. Or to take another case, plants which are regarded as being of a common definite type may produce varieties under natural conditions which are far superior to the parent plants. A striking illustration of this was recently seen at Kilnfield, Colchester, where among colonies of Caltha palustris, a natural variety, superior in blossom and colouring, was found and isolated. This is typical of many other plants, and the floral enthusiast who is ever on the alert may find much to interest, as well as to educate, in the close study of plant life. The question of British plants for garden adornment is a very live one, and we may yet see fuller justice done to our many beautiful native plants.

P. S. Hayward.

WHY SMOKE IS MADE.

If the reader understands why a torch smokes, why a flat wick is used in a lamp, why a circular burner is provided for the student lamp, why a chimney is provided for oil lamps, why a fish tail flame was used in early gas lighting, or why a vacuum bulb is provided for the incandescent lamp; if he understands these things, he will, it is believed, be able easily to see what conditions are necessary for perfect combustion in boiler furnaces.

If any fuel is to be burned without smoke it must be supplied with the correct amount of air. The torch smokes because the large round wick brings up oil, especially in the centre, to which air cannot be supplied. If the air supply through the centre tube of our student lamp is shut off, a smoking flame results. The candle with the small wick is an advance over the candle supplied with the large wick. The flame from the flat wick has an extended surface for air supply, while the circular burner not only has maximum surface for air supply, but the air coming up through the centre of the tube is heated, making it still better suited to aid combustion and burn a large amount of oil. Thus it is that we have successfully solved the problem of burning a large oil supply without smoke. If we try to increase the oil consumption and turn up our lamps too high, they smoke, and because they are in the room with us we immediately turn them down. Furnaces burning coal sometimes smoke just because they are forced too hard, and because the top of the chimney is not in the room, but in the public's pure air, we do not turn them down but let them smoke.

Air correct in amount is a necessity for complete combustion, and the simple experiments with our oil and gas flames should be sufficient evidence to us that only when we are able to supply our furnaces with the correct amount of air shall we be able to control the smoke which it is so easy to make. How much easier our problem would be if, as in the lamp, we could see all that was taking place and could regulate all by a simple knurled brass handle!—"Weekly Florists' Review."

VIOLA TRIAL AT MARKS TEY.

So eminently useful have violas become for summer displays of flowers that any considerable trial of varieties becomes interesting because of the splendid opportunities it gives for making comparisons. It is only when a few rows of each of many varieties are grown close to each other, under similar conditions of soil, cultivation, and exposure, that one comes to fully comprehend the differences of habit, freedom of flowering, form of bloom, or purity or distinctness of colouring that exist, and hence a trial becomes not only interesting, but of great educational value.

At Marks Tey, Essex, Messrs. Dobbie and Co. commenced a trial of violas suitable for bedding, as distinguished from varieties suitable for exhibition, last autumn, and on Saturday, June 13, a small party of horticulturists invited to inspect this trial resolved themselves into a committee, and awarded marks to show the merits of the varieties, using a basis of four points, i.e., one point each for habit, freedom of flowering, colour or purity, and form. As with few exceptions the varieties were grouped in their colours, comparisons were easy.

The white varieties were taken first, and from these the fine old variety Pencaitland was transferred to a class by itself, because it was considered that the yellow blotch on the tip, often covering the whole of the segment, placed the variety on an unfair footing with the pure white forms, but it was given four marks, and, now, as ever, it is one of the best of bedders, and of dwarf habit. Snowflake was placed first among the rayless white varieties, a position it worthily fills, because it has fine habit and bears beautiful pure flowers on good stems. Alexandra was voted the best rayed white viola, and, though it is not so dwarf as some varieties, it has such a combination of good qualities that it easily won first place. The white varieties that were accorded three marks each were Countess of Hopetoun, still one of the best; Duchess of York, free, and very dwarf; Marchioness, a trifle tall and scarcely up to the best form of flower, but wonderfully free and pure; Sylvia, a variety that is creamy white, but not deep enough to be placed among cream varieties; and Mrs. A. D. Parker, a fine dwarf rayless viola of great beauty. The latter closely resembles Seagull in form and shade, but surpasses it in freedom. Seagull, Bethea, Christiana, Redbraes White, Virgin White, Mrs. H. Pearce, and White Beauty gained only two marks each, while White Empress and F. C. Barlow were only considered worthy of one mark each.

Cream-coloured varieties formed a very small class of only three varieties, Cream King, Devonshire Cream, and Iliffe. The first-named was considered the best, but only three marks were given, as it lacks something in habit. Iliffe, with two marks, is rather straggling, and Devonshire Cream is small. All are of fairly good colour, but Cream King is easily the best. In the primrose group there were five varieties, and Primrose Dame was regarded as the best, and it gained full marks; the colour is deep primrose, habit good, and the rayless blooms are of good form. Sulphurea and Ardwell Gem gained three marks each, the former is very dwarf and of good form; and the latter is very clear and has rayed flowers. Maggie Clunas only merited two marks, and gained these on form and colour, but there was a general agreement that it was a fine exhibition variety. Daisy Grieve, a rayless, deep-hued variety, was voted one mark only.

The yellow violas form a most beautiful and interesting group, and at Marks Tey they made a blaze of brilliant colour, though only two rows of a variety were grown. Out of eleven varieties Walter Welsh was selected as the finest rayed variety, and Redbraes Yellow as the best rayless variety. These are both excellent violas, the latter being particularly dwarf and free. The less dwarf Royal Sovereign, of good form and colour; King Cup, of lovely colour, rayless, and of fine habit; the old favourite Bullion, a good standard sort; and Grievi, a very dwarf, pure-coloured variety, each gained three marks. A. J. Rowberry was considered too tall; Klondyke was scarcely free enough, though of good form and colour; and Wm. Lockwood was regarded as an exhibition rather than a bedding variety. Each of these merited two marks as bedding varieties, and Mrs. E. A. Cade and Canary were accorded but one vote each.

Lavender-coloured violas are of great value in summer-bedding arrangements. Of these there were six varieties on trial, and Florizel, with three marks, was selected as the best of its class; it is of beautiful colour, and in this respect it beat Kitty Bell, which ran it closely for first place. The latter is an early and continuous bloomer, and of soft lavender colour. This and Belfast Gem, a very light, distinct, free, and good-habited variety, each merited three marks. Miss Harding was not considered worthy of more than one point, and Ariel was excluded, though on the recommendation of some present it was considered useful for planting on rockwork.

The light-blue varieties were seven in number, and there was a spontaneous and unanimous agreement that Maggie Mott was easily the best in this class. It is scarcely so dwarf as some, but is very compact, free, of good form, and lovely soft blue colour. Mauve Queen and Blue Duchess were accorded three marks each; the first-named is a very good viola, and a trifle later than most, but mauve hardly expresses its colour. Favourite, a very dwarf form, gained two marks, and Lilacina, considered as a pansy—which it is—was accorded two marks as a bedding variety. Bridal Morn and Ithuriel gained one point each.

Councillor Waters was placed first among the dark-blue varieties; it is free, of good habit, and fine rich violet-blue colour. It was the only one of its class to secure full points. Ophelia, large, and of fine form; Admiral of the Blues, rich and free, but a little loose in habit; Royal Scot, very deep-hued and free; True Blue, a fine dwarf, bright bedding variety; Archie Grant, fine form and colour, but not quite so dwarf as could be wished; and Jubilee, blue with a deep maroon or crimson shade under the eye, were all awarded three marks. Charles Jordan, Mrs. C. Turner, Blue Rock, and Lady Warwick had all some defect of form, colour, or habit, and only merited two marks.

Fancy and unclassed varieties were considered on their individual merits, but not one gained full marks, and many lost a point in respect of habit. Glencoe, shaded yellow, old gold, and bronze; Dr. Macfarlane, a blue, blotched variety; Blue Cloud, the old, blue-edged form, Ada Anderson, whitish, with deep blue edge, Mrs. Chichester, a free-flowering fancy, pale rosy mauve, with blue edge; Wm. Niel, a very dwarf rosy mauve variety; and Crimson Bedder, badly named, deep rose, very free, were all granted three marks. Iris, Countess of Kintore, White Duchess, Mrs. J. H. Rowland, and Peace, of varied colouring, each gained two marks.

A new and beautiful rich bronze and scarlet-shaded fancy viola, raised by the Messrs. Dobbie, was seen in Mr. W. Cuthbertson's garden. It is of splendid colour and form, and very free and compact. Had it been on trial it would have merited full marks; it is as yet unnamed.

Parliament Square, for many years regarded as one of the brightest of the smaller open spaces in London, was not a success from the floricultural point of view during the summer of 1907. Various reasons were assigned for the failure of the flowers in the large beds, such as the unpleasant fumes from motor' buses, new paving, etc., but whether a satisfactory conclusion was ever arrived at we do not know. This year the square has no flower beds at all, but in each half of the square there are ten handsome pyramidal bay trees, that, like the green grass, are good to look upon.

ATMOSPHERIC NITROGEN AS A FUTURE COMMERCIAL SOURCE OF PLANT FOOD.

(Continued from page 463.)

◆

Different Methods for Utilising Atmospheric Nitrogen.

Up to the present time four methods have been found for combining atmospheric nitrogen with other elements. One is bacterial and the other three are chemical. The bacterial method has been frequently discussed in these meetings, and need not be further considered in this connection.

Of the three chemical methods, two have been commercially developed, while one is still in an experimental state. It will answer our purpose to confine our attention to the two methods in commercial operation.

Before considering in detail these commercial processes for preparing nitrogenous plant food compounds by use of atmospheric nitrogen, it may be of interest to touch briefly upon the historical phase of the problem. The first experiments which form the starting point in one solution of the problem were performed by Cavendish, and also by Priestly, between 1780 and 1790. These experiments were what we call purely scientific in character, the experimenters having no thought of the possible applications of nitrogen compounds, because at that time the relation of these compounds to agriculture was understood little, if at all. However, it was necessary that someone should discover the facts established by these experiments, before it was possible to begin to solve the problem which is now of so vital practical importance as to constitute one of the great world problems. This is only one of thousands of cases which furnish illustrations of the truth that we must first find out facts before we can apply them practically. The work necessary to discover such fundamental facts may seem to the layman like wasted effort, but sooner or later its necessity is fully demonstrated. These facts lay quietly in the records of science for over a century, waiting for the time when they should be called forth to meet the most urgent needs of mankind. But they were ready when called, and formed the fundamental starting point in the solution of the greatest of world problems, that of feeding our crops and mankind. It was not until 1895 that definite progress began to be made. The technical methods for producing nitrogen compounds by the use of atmospheric nitrogen have been developed within the last ten years, and, it might be more accurate to say, since 1900.

In connection with the two processes to be discussed, we will have to consider the following points: (1) The substance produced; (2) the method of production; and (3) the suitability of the product as nitrogenous plant food. In considering the method of production it would hardly be advisable here to go into the details; these are of interest to mechanical and chemical engineers, but are rather too technical for our present purpose.

Calcium Cyanamid.

The first substance we will consider is known by the chemical name of calcium cyanamid and by the common name of lime nitrogen. This compound, in chemically pure condition, contains 35 per cent. of nitrogen; but the commercial product known as lime nitrogen is not pure, varying in contents of nitrogen from 14 to 22 per cent., the higher percentage being obtained by the latest modifications of the process.

Method of Manufacturing Lime Nitrogen.

The materials used in preparing lime nitrogen are (1) calcium carbide, the product so familiar to us in the production of acetylene gas, and (2) pure nitrogen obtained by liquefaction of air and distillation of the liquefied air. The nitrogen is passed over heated calcium carbide, and combines with it more or less completely. In later modifications of this process, calcium chloride or calcium fluoride is mixed with the carbide. The product resulting from the process is a mixture of calcium cyanamid and carbon.

Theoretically, 100 pounds of calcium carbide combine with 43¾ pounds of nitrogen to produce 125 pounds of calcium cyanamid and 18¾ pounds of carbon, or 143¾ pounds of lime nitrogen containing about 30 per cent. of nitrogen. But the combination of nitrogen is not complete according to theory, owing to defects in the process. Hence, the mixture produced, known as lime nitrogen, contains much less than the theoretically possible amount of combined nitrogen, varying, as previously stated, from 14 to 22 per cent.

Conversion of Lime Nitrogen into Plant Food.

The calcium cyanamid in lime nitrogen is not directly used as such by plants. It is interesting to notice the general change which it undergoes before it is directly useful as plant food. There are some details which can just as well be omitted here, the main fact being kept in mind that the nitrogen of calcium cyanamid changes into ammonia, which is one of our familiar acquaintances. This change we will now study briefly.

When calcium cyanamid is heated in contact with water under pressure, it gives off ammonia readily, forming, in addition, calcium carbonate (carbonate of lime).

For each 100 pounds of calcium cyanamid used, 67½ pounds of water would be used, and there would be formed 42½ pounds of ammonia and 125 pounds of carbonate of lime. One ton of lime nitrogen containing 20 per cent. of nitrogen would combine with 270 pounds of water, furnishing 170 pounds of ammonia and 500 pounds of carbonate of lime.

Now, here is an interesting fact: This change, which takes place quickly when calcium cyanamid is heated under pressure in the presence of water, also takes place when lime nitrogen is distributed in moist soil, but much more slowly.

I do not know that we can yet regard as settled the question as to whether this change, when it occurs in soil, is a simple chemical change, similar to that produced by treating calcium carbide with water in the production of acetylene gas, or whether it is produced only by the instrumentality of bacterial action. The latter view appears to be the prevailing one, supported by a considerable array of facts.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, June 9.

Present: E. A. Bowles, Esq., M.A., F.L.S., F.E.S. (in the chair); Dr. M. C. Cooke, Dr. A. Voelcker, Messrs. A. W. Sutton, J. T. Bennett-Poë, W. Cuthbertson, H. T. Güssow, G. S. Saunders, W. Hales, W. C. Worsdell, E. M. Holmes, L. de B. Crawshay, J. W. Odell, and F. J. Chittenden (secretary).

BRUGMANSIA LEAVES INJURED.—Mr. Güssow reported that he had examined the leaves of Brugmansia shown at the last meeting by Mr. Saunders, and found that they had been injured by some insect which had punctured the leaf, and around this puncture corky cells had developed.

MALFORMED ORCHIDS.—Mr. W. C. Worsdell reported that he had examined a specimen of Cattleya intermedia referred to him in which three flowers had become fused together so that there were eighteen perianth pieces in the resulting fasciated specimen and three properly-formed columns. The ovaries, however, were completely absent. Mr. Gurney Wilson, of Glenthorne, Haywards Heath, Sussex, sent flowers of Odontoglossum crispum, which were referred to Mr. Worsdell.

OXALIS BUPLEURIFOLIA. — Mr. W. Hales, F.R.H.S., showed the interesting Oxalis bupleurifolia, a Brazilian species with small yellow flowers, having the petioles developed into phyllodes, which are remarkable as being placed horizontally instead of vertically, as in most plants possessing phyllodes. In several cases the phyllodes possessed at their tips the three leaflets normal in species of Oxalis, though occasionally the terminal one was represented only by a small linear outgrowth, and sometimes all were absent. These leaves are sensitive to contact. The plant grows in shady woods in Brazil, which probably accounts for the horizontal position of the phyllodes.

MALFORMED STREPTOCARPUS.—Mr. J. W. Odell, F.R.H.S., showed very fine flowers of streptocarpus having in some cases two linear petaloid outgrowths arising between the calyx and the corolla on the dorsal side of the flower, in others stamens were produced in this position. Mr. Odell found that the later-produced flowers bore stamens, while the first flowers had the petaloid outgrowths. He had seen similar growths in gloxinia, and in the present case he removed the first developed flowers as soon as the petaloid outgrowths were noticed, and the flowers next produced developed stamens in the position occupied by the outgrowths in the first-produced flowers.

ROSA LUTEA.—In June, 1906, Mr. A. W. Sutton, F.L.S., showed before the committee dried specimens of a yellow rose which had been named at Kew, Rosa Eglanteria (= R. lutea) from Baalbec. Mr. Sutton subsequently obtained, through a lady missionary at Baalbec, some pods and shoots of this rose, but they were dead when they arrived. Later, however, he received other seeds, from which three plants had been reared, and which were now flowering in his garden. He exhibited a flower of a beautiful clear yellow colour, measuring 3in. in diameter.

YELLOW STRIPE IN DAFFODILS.—Specimens of this well-known disease were received, and some discussion took place concerning it. Various members of the committee detailed their experiences concerning it, and regarded as contributory causes the use of fresh manure, late planting, and too wet a soil. The precise primary cause is at present unknown, but, as Mr. Darlington suggested in his lecture at the general meeting, imperfect root action may be a cause, but whether primary or secondary is not clear.

ABNORMAL DAISY.—Mr. A. W. Sutton showed an abnormal daisy having the head inverted so that the florets pointed downwards instead of upwards as in the normal inflorescence; while the stalk passed completely through the centre of the head and was attached at the upper side where there were the usual bracts forming the involucre, but in this case occupying the upper portion of the inflorescence.

VISIT OF COUNCIL AND COMMITTEES TO WINDSOR.

On the 10th inst. the members of the council and committees of the Royal Horticultural Society visited, by permission of the King, the Royal Gardens at Windsor and Frogmore. The party, numbering about 100, included Sir Trevor Lawrence, president, and the Rev. W. Wilks, secretary, and was, on reaching Windsor, hospitably entertained at the Guildhall by the Mayor of Windsor. At the close of the lunch the toast of "The King" having been duly honoured, Sir Trevor Lawrence proposed, in a singularly happy manner, "The Health of the Mayor." This toast was drunk with musical honours, and acknowledged in felicitous terms. The party then proceeded to inspect St. George's Chapel and the State apartments with the Resident Architect as guide. Leaving the Castle by way of the East Terrace, the visitors walked to Frogmore and inspected the Royal Mausoleum, and thence went to the Royal Gardens, where they met with abundant evidence of good gardening. Here about two hours were spent in walking through the innumerable plant and fruit houses and the quarters devoted to fruits and vegetables, and, in expressing their high appreciation of Mr. Mackellar's remarkable administrative ability.

COLONIAL FRUIT SHOW.

Another of the exhibitions of Colonial fruit and other produce was held at the Royal Horticultural Hall, Westminster, on Thursday, June 11. Whether, from the Colonial standpoint, this display was a success, we cannot say, but, as an exhibition pure and simple, it fell very far short of what one expects nowadays, and it was so poorly attended as to suggest that very few people cared much about it.

Birmingham.

Encouraged by the success of the past three years, the committee of the Birmingham Botanical and Horticultural Society has decided to continue the shows this year, viz., June 11 and July 15, the former for orchids and early summer flowers, and the latter for roses and midsummer flowers. The exhibition of June 11 proved eminently successful, and the attendance good. In addition to the competitive classes, medals were offered for other exhibits, and these resulted in an extraordinary display of orchids. The Right Hon. Joseph Chamberlain, M.P., sent a large and fine collection of orchids, effectively arranged by his grower, Mr. J. Mackay. It occupied about 40 feet run, and as each kind was represented by a considerable group, the exhibit produced a more striking effect than if arranged indiscriminately. The central portion consisted of very fine specimens of cattleyas and lælio-cattleyas, supplemented by a magnificent set of Odontoglossum crispum and other species. In suitable positions phalænopsis added grace to the scene, and the whole was flanked at each end by a grand display of Miltonia vexillaria, with a few plants of Anguloa eburnea, Cochlioda Noetzliana, and Ærides affine superbum, the whole making probably the grandest single exhibit of orchids ever staged in the Botanic Gardens, Edgbaston, or elsewhere in Birmingham. The society's highest award, a silver-gilt medal, was worthily bestowed.

In the competitive class for six orchids in flower, dissimilar, Mr. Mackay was the only exhibitor, and was awarded the first prize for fine examples of Miltonia vexillaria, Lælio-cattleya Aphrodite with thirteen flowers on it, and some unnamed specimens. In the class for twelve stove and greenhouse plants, Mr. R. Usher, gardener to J. A. Kenrick, Esq., Harborne House, Harborne, was the sole exhibitor; his plants consisted only of fairly good Hydrangea Hortensis and Astilbe Queen Alexandra; a third prize was awarded. Considering the district's resources, it was a matter of surprise that there was not a stronger competition in the classes just enumerated.

In the honorary classes, Mr. F. H. Jones, gardener to W. Waters Butler, Esq., Southfield, Edgbaston, staged a very fine collection of orchids, chiefly of Odontoglossum crispum, several being of high excellence, though not large specimens; there were also Lælio-cattleyas, miltonias, masdevallias, cypripediums, etc., backed by a row of tall white lilies in pots. An Award of Merit was granted to a remarkably fine form of Odontoglossum crispum named Southfield variety, possessing two fine racemes, with pure white petals, and sepals flushed with pale purple, and blotched with bright chocolate; this was exhibited by the last-mentioned grower, who gained a silver-gilt medal.

Messrs. Baker and Son, Wolverhampton, contributed an imposing display of aquilegias and oriental poppies, and to which a silver-gilt medal was awarded. Messrs. Gunn and Son, Birmingham, brought up an attractive display of roses in pots, including trained pillar specimens of hybrid teas and hybrid perpetuals; a silver medal was awarded. Messrs. Sander and Sons, St. Albans, were also awarded a silver medal for a collection of orchids, and a similar award was granted Mr. R. Sydenham for a bright group of Spanish irises and ixias.

Bronze medals were allocated to Messrs. Richard Smith and Co., Worcester, for a collection of hardy cut flowers; and to Mr. H. N. Ellison, West Bromwich, for a choice collection of ferns. Needless to remark, the display of orchids and other flowers in the various glass departments; also the alpine rock gardens, and the display of rhododendrons were objects of admiration from the visitors.

Royal National Tulip Society (Northern Show).

This exhibition was, as it has been for some years past, held at Middleton, near Manchester, on June 10. Time was when the show was a movable feast, and Derby, Manchester, Oxford, Birmingham, Cambridge, Slough, etc., competed for the honour. Times are altered now, and comparatively few hold the tulip in honour, and, as one looked at the small number of exhibitors and exhibits, it was not possible to avoid contrasting it with former times, over thirty years ago, when the competition was great, and the rivalry keen. I well remember having to go to shows as a lad to help fill bottles, write prize cards, etc., and I did not like it, because the show was generally somewhere in or near Whit week, and it interfered with my holidays. Later on, I came to like both the men and the flower they loved, and now they are nearly all dead, only Messrs. Horner, Thurston, and Simonite left, and these, although full of admiration for the flower, never exhibit.

The season has been unfavourable for tulips, the cold, miserable weather experienced up to the middle of May, followed by the great heat at the end of that month and the early part of June, was the worst that ever I knew, for the flowers were retarded when they should have been growing, and burst open, and burnt away in the utterly callous fashion that Nature at times favours us with, and thus had a short ignominious life, and few exhibitors were able to put in an appearance at Middleton, and only Mr. Knowles and myself were able to save the show from being a fiasco.

Great credit is due to Mr. Knowles, for, although the season has been so bad, he was able to bring some really fine flowers, especially feathered ones, and it was a treat to see his Wm. Wilson, Violet Amiable, Lizzie, and Flamed Sir J. Paxton. Breeders were poor; bitter cold, followed by great heat and thunderstorms, don't suit breeders, which soon show signs of giving up the unequal struggle.

The following were the awards:

Twelve dissimilar rectified tulips: First, Mr. J. W. Bentley, Middleton, with Sir J. Paxton, Masterpiece, Samuel Barlow, Mrs. Atkin, Jane, A. McGregor, Aglaia, Violet Amiable, Amazon, Talisman, and Bob Moorley; second, Mr. James Knowles, Stalybridge, with W. Wilson, Sir J. Paxton, Dr. Hardy, Modesty, Mrs. Collier, A. McGregor, Lady C. Gordon, Lilian, Talisman, Beauty of Litchurch, and seedling.

For six dissimilar rectified tulips: First, Mr. Knowles, with J. Smith, S. Barlow, Lady C. Gordon, A. McGregor, Talisman, and Stockport; second, Mr. Bentley, with Garibaldi, Sir J. Paxton, Mrs. Collier, A. McGregor, Violet Amiable, and Talisman; third, Mr. W. Mellalieu, Middleton.

Six dissimilar rectified tulips (for small growers): First, Mr. W. Stringer, Middleton, with Sir J. Paxton, Rose Hill, A. McGregor, Adonis, and Violet Amiable; second, Mr. W. H. Hulse, Middleton, with Sir J. Paxton, Mabel, A. McGregor, Adonis, and Violet Amiable.

For three feathered tulips: First, Mr. Knowles, with Lord F. Cavendish, Lizzie, and Lucy Grey; second, Mr. Bentley with Masterpiece, Mrs. Atkin, and Thurstan's Seedling. Three flamed tulips: First, Mr. Bentley, with Sir J. Paxton, Mabel, and Talisman; second, Mr. Knowles, with Sir J. Paxton. A. McGregor, and Talisman; third, Mr. Stringer.

Pair of tulips (maiden growers): First, Mr. Stringer with Lizzie and A. McGregor; second, Mr. Mellalieu, with Modesty and Sir J. Paxton; third, Mr. Hulse. Pair of tulips: First, Mr. Knowles, with Lizzie and Dr. Hardy; second, Mr. Bentley with Sir J. Paxton, feathered and flamed; third, Mr. Stringer; fourth, Mr. Mellalieu; fifth, Mr. Hulse.

Single blooms: Feathered bizarres, first and second, Mr. Knowles with Lord F. Cavendish; third and fourth, Mr. Bentley with W. Wilson and Masterpiece. Feathered roses: First and second, Mr. Knowles with Modesty and Rachel; third and fourth, Mr. Bentley with Jane and Lizzie; fifth, Mr. Stringer; sixth, Mr. Mellalieu. Feathered byblœmens: First and second, Mr. Knowles with Dora and Violet Amiable; third and fourth, Mr. Bentley with Bessie and Diarmid. Flamed bizarres: First and second, Mr. Knowles with Sir J. Paxton; third and fourth, Mr. Bentley with Sir J. Paxton and Dr. Hardy. Flamed roses: First and second, Mr. Knowles with A. McGregor and Mrs. Telford; third and fourth, Mr. Bentley with Mabel and A. McGregor; fifth, Mr. Stringer. Flamed byblœmens: First and fourth, Mr. Knowles with Talisman; second and third, Mr. Bentley with Talisman; fifth, Mr. Mellalieu.

For the best flamed flower in the show: Mr. Knowles with Sir J. Paxton. The best feathered flower in the show: Mr. Knowles with Wm. Wilson.

Six breeder tulips, two of each class: First, Mr. Bentley with A. Lloyd, Gerald (seedling), Olivia Dawn (seedling), Diarmid, and seedling. Three breeder tulips, one of each class: First, Mr. Bentley with Gerald. Thurston's rose seedling and seedling; second, Mr. Stringer with Lloyd's 219, A. McGregor, and Beauty of Litchurch. Single blooms, bizarre breeders: First and second. Mr. Bentley with Sir J. Paxton and A. Lloyd; third, Mr. Mellalieu. Rose breeders: First and second, Mr. Bentley with Mdme. St. Arnand and A. McGregor; third and fourth, Mr. Mellalieu with Rose Hill; fifth, Mr. Stringer. Byblœmens, breeders: First and second, Mr. Bentley with Seedlings; third, Mr. Mellalieu with Beauty of Litchurch. Best breeder in the show: Mr. Bentley with Alfred Lloyd.

J. W. B.

East Anglian Horticultural Club.

Although the early part of June is a busy time in the garden, the members of this club turned up well at the monthly meeting held at Norwich on the 10th inst. The subject for the evening was a paper by Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park, upon "Herbaceous Flowers." Locally, Mr. Smith has quite a reputation for these flowers, being one of the chief prizetakers at the local exhibitions. To illustrate his paper, he had brought up about 60 kinds and varieties, and a very nice group they made.

At the outset, Mr. Smith spoke of the glories of the herbaceous border, as compared with the old stereotyped system of carpet-bedding. He stated borders could be made practically any size according to the space at command. Soil was not of such importance as deep digging and a liberal supply of good manure. How, when, and where to plant the several subjects gave material for some most practical cultural remarks which were splendidly expressed. He did not favour the cutting down of the flower stems as soon as the blooms had faded, but would leave them on till new growths appear, as this encourages stronger growth. The various forms of planting, in blocks, lines, dots, or broad colour effects, were all dealt with in detail. For a north border one had a host of plants always interesting, and Mr. Smith enumerated those which he grows, and which with him seem quite at home.

Having exhausted his cultural and suchlike details, the lecturer went through a list of the best subjects he grows at Shotesham, which was most comprehensive. As might be expected, an animated discussion followed, in which Messrs. J. Powley, H. Perry, T. B. Field, E. Peake, H. Goude, E. Pitcher, C. Burtenshaw, and J. C. Abel were the chief debaters. Mr. Smith suitably replied, and was accorded the best thanks of the club for his paper.

The exhibition tables were nicely filled with subjects, especially cut flowers and flowering plants. The exhibit of Mr. T. Notley, gardener to his Worship the Mayor of Norwich, of strawberries, variety Mentmore, was superb. Mr. F. Williams, gardener to Louis Tillett, Esq., M.P., Catton, staged the best herbaceous flowers in competition, and the pelargoniums of Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, deserve mention.

British Gardeners' Association.

At the monthly meeting of this association Mr. E. F. Hawes, superintendent of the Royal Botanic Society's Gardens, Regent's Park was elected chairman of the Executive Council for the ensuing year, and Mr. Char Foster, vice-chairman, for the same peri

Nineteen new members were elected, bringing the total up to 1,308. Messrs. Hawes, Foster, Winter, Castle, Raffill, and Weather were appointed on the Publication Committee. The examination question was discussed, and it was decided that an outline of its scope should be given in next issue of "Journal."

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

[illegible] flowers, and fruits for naming [illegible] be sent to the Editor of the [illegible] MAGAZINE, "Endsleigh," Priory Park, [illegible] and as early in the week as possible. [illegible] be sufficiently prepaid.

[illegible] be glad to receive photographs of [illegible] flowers, trees, fruits, etc., for [illegible] the GARDENERS' MAGAZINE. He will [illegible] obliged by correspondents sending early [illegible] of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

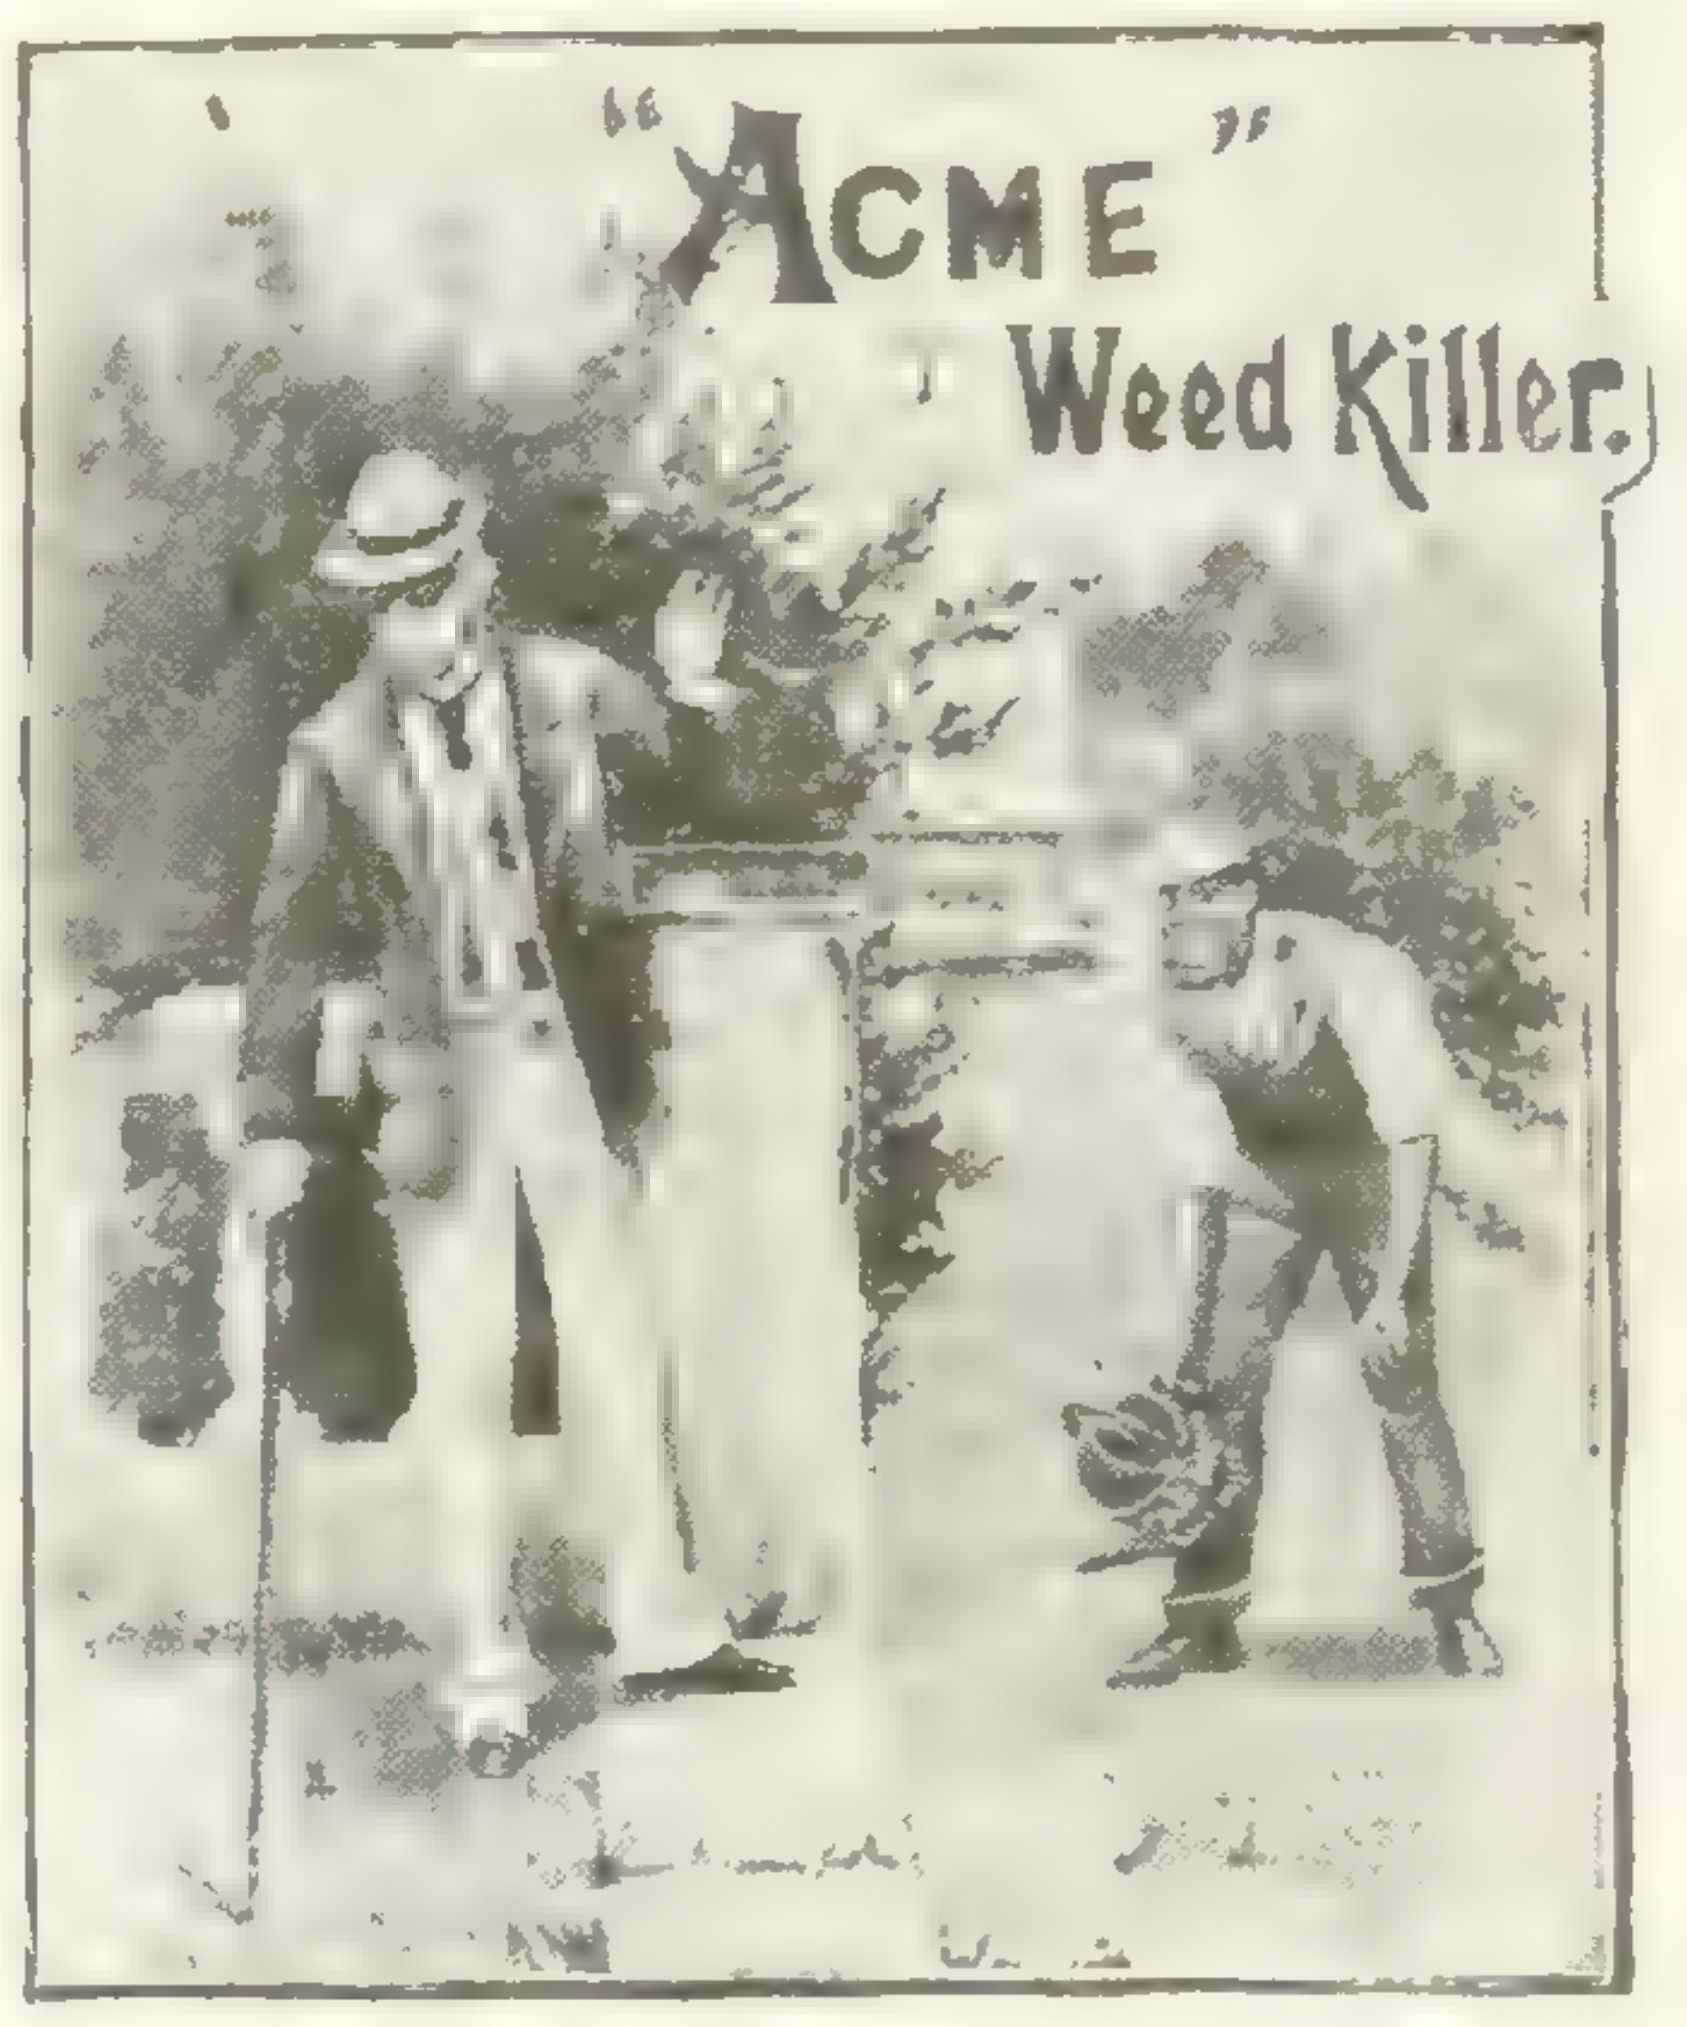
NEW SWEET PEA.—C., Devon: The variety is a distinct one, and well worth taking care of. If the colour keeps well and does not burn or run, the variety should prove a very useful one.

ROSES.—E. T., Walsall: For the present stick to the nitrate of soda, as previously suggested. It is a great pity your garden is so far from the residence, and the distance is a great handicap. If the garden was at home, so to speak, an hour or even a half-hour, morning and evening, devoted to the flowers, and to keeping pests under, would work wonders. Of the several remedies suggested, we should select Abol or Quassia extract. It was a great mistake to use long litter to cover the roses during winter, and no doubt a good deal of the weakness of the plants is due to its use. Bracken is by far the best material to use, you should cut it directly it is full grown and firm, and stick it when dry, as it then lasts better than if left until autumn before being cut. We cannot promise to always reply through the post, but we shall be always pleased to answer you through these columns. Accumulate wood ashes for a subsequent dressing, as your soil lacks potash, but, remembering the materials you have used already, a potassic fertiliser is not now desirable.

DENDROBIUM MOSCHATUM.—E. A. R., Darlington: There appears to be little need for us to enter into the details concerning the cultivation of Dendrobium moschatum, because, by your own showing, and by the specimens sent, it is evident you have hit upon the right conditions for this orchid. Abundance of light is necessary as the growths finish to ripen them up. Unfortunately the market value of D. moschatum is very small either as a plant or as cut flowers; it is one of the worst of dendrobiums so far as the lasting qualities of the flowers are concerned, as the blooms rarely last a week in good condition, but this fleeting character will, no doubt, have become apparent to you ere this. Sometimes an orchid enthusiast desires a large specimen of a rarely-grown species, such as D. moschatum, therefore it would be a good plan to notify one or two of the orchid specialists who advertise in our columns, that you have specimens you are willing to dispose of as occasion offers. D. moschatum is a fairly common species in Lower Burmah and Moulmein. It was first discovered in 1825 by Dr. Wallich.

INFESTED APPLE TREES.—J. W. W., [illegible]: The leaves sent were very badly infested with aphides, indeed, we have rarely seen a worse example of what greenfly can do. There were not many live aphides on the leaves, but there were lots of dead ones, and plenty of filth. The trees should be carefully sprayed with a fairly strong tobacco or quassia solution, with soft soap added to give the solution adhesiveness. [illegible] is 2lb. of soft soap, and ½lb. of [illegible] to [illegible] gallons of water, the two former being boiled separately to dissolve the one and extract the virtue from the other. A good remedy is made by adding paraffin to soft soap boiled in eight parts of water, the paraffin will amalgamate with this mixture if stirred vigorously when all is boiling hot; this should be diluted with warm water so as to allow a half-gill of paraffin to each gallon

CLEAN PATHS. CLEAN PLANTS.



"Weeds, weeds, everywhere! I wonder if that new gardener can suggest anything."
"Yes, sir, I'm just using the 'Acme' Weed Killer. The best in the world for killing weeds."

Used in the Crystal Palace Grounds, the Royal Horticultural Society's Gardens, Kew, and in the principal Gardens of the United Kingdom.

STRENGTH 1 in 25. 1 Gall. to 25 Galls. of Water.

1 gall. 2/3, tin free; 5 gall. 7/6, drum 2/6; 10 gall. 13/4, drum 5/-; 40 gall. 50/-, cask 5/- Carriage paid on 5 gallons and upwards.

DOUBLE STRENGTH. 1 Gall. to 50 Galls. of Water.

½ gall. 2/-, tin free; 1 gall. 3/6, drum 9d.; 5 gall. 14/-, drum 2/6; 10 gall. 25/6, drum 5/-; 40 gall. 90/-, cask 5/-. Carriage paid on 2 gallons and upwards. Empties allowed for when returned.

"ACME" POWDER WEED KILLER.

Sizes.	Tins free.	Per tin.
No. 1.	To make 25 gallons	1/9
No. 2.	" 50 "	3/3
No. 3.	" 100 "	6/-

Soluble in cold water. No. 3 carriage paid. Prices for larger quantities on application.

COMPOUND QUASSIA EXTRACT INSECTICIDE.

Safest and best for all purposes.
Certain death to Aphis, Red Spider, &c., &c. Sample pint, sufficient for 10 galls., 1/-, post paid. Try it.

ACME CHEMICAL CO., LTD.,
TONBRIDGE, KENT; and RIVER ST., BOLTON, LANCS.

** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

of spraying solution. Judging from the leafage, we believe your trees are suffering from drought, and so we suggest that they be all subjected to a vigorous hosing with clear water a day before the spraying is done; this will clear away some of the filth, freshen the trees, and also give the roots the much-needed moisture. It may be necessary to spray two or three times at intervals of three or four days; a hosing during the intervals will materially help matters. The larvæ present with the aphides are those of the Lacewing fly; these eat the aphides, but when the latter are present in such quantities the grubs do not seem to appreciably diminish the plague.

CUTTING ASPARAGUS. — In reply to E. Q. L., Farnham, Mr. Guilano writes from Elstree as follows: I have found that asparagus cut in early morning is more juicy, and cooks better than asparagus cut in the afternoon or evening. The early cut asparagus is more tender when cooked, and of finer flavour. Asparagus cut late in the day is firmer to the touch and more difficult to cook than that cut early, and, moreover, it is not of such good flavour.

SILVER LEAF ON PLUM.—E. M., Basingstoke: With very few exceptions the dreaded silver leaf disease sooner or later kills the trees it attacks, and the worst of it is that the disease is so subtle that its origin and its cure and prevention are unknown. It has been frequently suggested that lack of iron in the soil is a contributory cause, and in some instances an application of sulphate of iron solution has checked the disease. This is applied at the rate of ½ lb. of the sulphate to three gallons of water, and given at intervals of a week or ten days, the border being well moistened with the solution. It was believed that the disease was associated in some way with a fungus known as Stereum purpureum, a species that appeared to be always found where there was an attack of silver leaf, but Mr. Spencer Pickering has proved that the latter does sometimes exist without the former. Of course the American gooseberry mildew is not of quite recent appearance, but if your Job's Comforter means that silver leaf is a more recent discovery than the modern outbreak of American gooseberry mildew in this country, we can only say that his knowledge of the matter is infinitesimal, and he cannot be a regular reader of the GARDENERS' MAGAZINE. The grower who found silver leaf did not in any way affect the cropping of the peach tree it had attacked, has an experience quite foreign to any we have heard of. Try the sulphate of iron treatment, and cut out the diseased portions as soon as possible; if this treatment fails then root out the tree and plant a young vigorous and healthy one in new soil.

NITRATE OF SODA FOR ROSES.—R., Walsall: Sulphate of potash should be applied earlier in the season. For the present to encourage growth you should give the bed a dressing of nitrate of soda, at the rate of ½ oz. to the square yard; this should be thoroughly watered in at once, and the following day the surface of the bed should be hoed with the Dutch hoe. Keep the roses clean, and do not be afraid to use the hose or garden engine. Give another dressing of nitrate of soda about a month hence.

E. A. A., Farnham, and J. A., Gravesend.—We are giving the respective questions attention, and hope to publish the replies in our next issue.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

E. A. R., Darlington.—Dendrobium moschatum.

R. P., Bedford.—1, Cestrum elegans; 2, Lotus peliorhynchus; 3, Asplenium Nidus-avis; 4, Todea arborea.

M. M., Watford.—1, Plumbago capensis alba; 2, Odontoglossum cirrhosum; 3, Ærides affine; 4, Pilea muscosa.

H. W., Moreton.—1, Achillea rupestris; 2, Thalictrum adiantifolia; 3, Saxifraga peltata; 4, Olearia Haasti.

T. V., Bath.—1, Leycesteria formosa; 2, Gaultheria Shallon; 3, Galax aphylla; 4, Cotoneaster horizontalis; 5, Circis siliquastrum alba.

R. S. D., Salisbury.—1, Pinus Cembra; 2, Abies Douglasi; 3, Cedrus Deodara; 4, Abies canadensis; 5, Cupressus Lawsonianus erecta viridis; 6, C. macrocarpa lutea.

T. H. S., Lingfield.—1, Peristeria elata; 2, Potentilla anserina; 3, Mertensia sibirica; 4, Cytisus Andreanus; 5, Delphinium nudicaule; 6, Schizanthus retusus.

F. E. G., Whitby.—1, Veronica gentianoides; 2, Thuja dolobrata; 3, Phlox canadensis; 4, Pulmonaria saccharata; 5, Galium aperina; 6, Sedum acre aurea.

L. H. B., Stratford-on-Avon.—1, Lupinus polyphyllus; 2, Lupinus arboreus; 3, Philadelphus coronarius; 4, Deutzia crenata flore-pleno; 5, Prunus Pissardi; 6, Manettia bicolor.

FORTHCOMING ENGAGEMENTS.

TUESDAY, June 23.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. by the Rev. Prof. G. Henslow, V.M.H., on "The Absorption of Rain and Dew, by the Green Parts of Plants"; Scientific Committee at 4 o'clock.

Horticultural Club, Hotel Windsor; Dinner at 6 p.m.; lecture on "Development of Gardening in Victoria during Recent Years," by Mr. H. Hitchcock.

WEDNESDAY, June 24.—Royal Society of Arts.

Horticultural Exhibition at the Franco-British Exhibition; three days.

Gardeners' Royal Benevolent Institution; Anniversary Festival Dinner at the Whitehall Rooms, Hotel Metropole, 7 p.m.

SATURDAY, June 27.—Reigate Rose Show.

Windsor Rose Show.

SAFE **GARDO** SURE

AN INVALUABLE INSECTICIDE FOR GREENHOUSE & GARDEN.

Gardo is effectual for all kinds of Aphis and other insect pests. It is non-poisonous, soluble in water and, if used according to instructions, does not discolour or leave any visible film on the foliage or flowers.

Gardo is used by some of the best amateurs and largest members of the trade at home and abroad. Sold in Tins: **1/-, 1/6, 2/6 & 4/-** each. Drums: 1 gall. **7/6**; 2 gall. **13/6**; 5 gall. **30/-** each, by Seedsmen, or sent direct from Ipswich on receipt of P.O.

Send a post card for full particulars and directions for use to

THE CHEMICAL UNION, LIMITED, IPSWICH.

MANUFACTURERS OF CANARY GUANO.

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls.

B. BROOKS, Minerva Cottage, Elm Grove, Worthing.

GARDENER (Head Working, where several are kept); life experience in all branches; thorough knowledge of the culture of grapes, melons, peaches, cucumbers, stove and greenhouse plants, flower and kitchen garden; leaving through estate being given up; good references from present and previous employers; age 39, married. H. K., Sidmouth Grange, Earley, Reading.

GARDENER (Head Working, where two or more are kept); thoroughly experienced in vines, stove, and greenhouse plants; early and late forcing, fruit, flower, and kitchen garden; good reference; age 48; no family; life abstainer. E. DABORN, 52, Mersham Road, Thornton Heath, Surrey.

GARDENER (Head of two or three); life experience Inside and Out, including Vines, Peaches, Melons; age 32; single; excellent references. H. BENSTEAD, Spencers Row, Heacham, Norfolk.

GARDENER, life's practical experience, desires Situation where the services of a competent, trustworthy Man would be appreciated; excellent character; age 32; 2 children; churchman; please state wages offered. GARDENER, 66, Sandholme Road, Brislington, Bristol.

GARDENER (good Single-handed or where help is given); age 35; married, no family; good experience Inside and Out; highly recommended by present employer; good references. J. SAUNDERS, The Lodge, Waratah, Chislehurst, Kent.

GARDENER (Single-handed or with help); life experience Inside and Out; age 35; tall; married, one child; foreman last situation; good references. H. J. W., 17, Salmestone Road, Margate, Kent.

GARDENER (Single-handed or with help); good characters; age 29; single. W. P., 164, High Street, Dorking.

GARDENER seeks SITUATION (Single-handed or second); 10 years' experience; good references; age 24; disengaged. A. RANDALL, 62, Sussex Road, South Croydon.

GARDENER (Single-handed or otherwise), married, one child; age 26; cause for leaving, reducing expenses. H. APPLEBY, 22, Collins Street, Blackheath Village, Blackheath.

AS GARDENER (Single-handed, or with help), life experience (Inside and Out); can be well recommended from last place; also good previous references; age 44, single. F. GOWERS, Broad Green, Gt. Waltham, Chelmsford, Essex.

MARRIED MAN as KITCHEN GARDENER or SINGLE-HANDED; life experience; 7 years in present situation; good references.—S. GEORGE, Woodside Gardens, Maidenhead, Berks.

A YOUNG MAN seeks a SITUATION as Second, where two or three are kept; gardener; age 24. Apply, E. STAMP, c.o. Mrs. King, Swallowcliffe, Checkendon, near Reading, Oxon.

GARDENER (Under), age 19, seeks SITUATION; five years' experience Inside and Out; three years' good character. A. WORSFOLD, Benenden, Cranbrook, Kent.

KITCHEN GARDENER seeks SITUATION; would not object to milking or poultry; two years' reference; married, no family. Apply, C. L., No. 1, South Road, Camberley, Surrey.

JOURNEYMAN (Inside or Inside and 8 years' experience gained in good ments, including Grimsthorpe Castle; ences. Apply J. S., Vicarage Farm, Kirtling market, Cambs.

ORCHID GROWER and GARDENER DAVENPORT is at liberty to Engage with Lady or Gentleman requiring the services of a class Man; thoroughly experienced in all of the profession; good testimonials; can be recommended by late and previous employers Marlfield Road, West Derby, Liverpool

CHARGE HAND or otherwise, age 26, years' experience, Private and Trade; references; disengaged when suited. A. DUNCA Lane's Farm, Hatfield Peverel, Essex.

RICHARD SMITH and CO., LTD., beg announce that they are constantly receiving plications from Gardeners seeking Situations, they will be able to supply any Lady or with particulars, etc. St. John's Nurseries,

SITUATION required by a middle-aged Scotsman who has had a life experience branches of horticulture; has held important tions in Scotland, England, and Ireland, and be highly recommended for a post as private or public gardens. Apply J. M., this Paper.

SITUATION as ESTATE CARPENT and HANDY MAN. Apply with full lars, wages, etc., to E. KENNARD, Blacknest, ninghill, Berks.

P. S. HAYWARD requires post, all Horticulture, Perennials, Alpines, Glass tures, and general routine. Braiseworth, folk.

YOUNG MAN seeks SITUATION and Out); age 19; 3 years' reference place; general experience. C. MARTIN, 170 ton Road, West Norwood.

YOUNG MAN seeks SITUATION den; age 18½; two years and eight good character; four years' experience. H SON, Fawkham Manor Lodge, Fawkham, Kent

YOUNG MAN seeks SITUATION, age Inside and Out, or Single-handed; good ref Ayres, High Street, Elstree, Herts.

Situations Vacant.

HEAD-WORKING GARDENER, two kept; all-round Man, especially tions, Roses, Shrubs, and Vegetables. married; an artistic bedder-out and fond ing. Wages, 23s., and rooms. Apply Essex this Journal.

THOMSON'S VINE, PLANT, & VEGETABLE MANURE

GROS COLMAN GRAPES

CUT FROM VINES AT

TWEED VINEYARDS, CLOVENFORDS.

As is well known our Vines, after bearing very heavy crops of the **Finest Grapes** for 35 years, are **Still Bearing** crops equal in quality and weight to those of their early years.

This Fact SPEAKS VOLUMES FOR THE SUSTAINING AND STIMULATING QUALITY OF OUR MANURE.

Is Unrivalled FOR **VINES, TOMATOES, FRUIT TREES, POT PLANTS, VEGETABLES LAWNS,** &c., &c.

And is the result of many years **Practical Experience**

Other Specialities: THOMSON'S STYPTIC for preventing the Bleeding of Vines, and for use in Budding and Grafting. Also **THOMSON'S "SPECIAL" TOP-DRESSING MANURE.** Perfect Plant Foods and Stimulants. Largely used at Home and Abroad. Invaluable to all Gardeners. Also **"Thomson's Book on the Vine."** 11th Edition.

May be had from all Nurserymen or Seedsmen, or direct from the SOLE Makers—

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Vermin.

Just as weeds are plants in, from the human point of view, the wrong place, so must vermin be regarded as animal or insect life existent under conditions inimical to man's interests. We not infrequently hear the question, "What conceivable useful purpose can such and such forms of vermin subserve?" and in most cases from the point of view of direct or indirect service to humanity, it is impossible to find an answer. Take, for instance, the inconceivable myriads of locusts which from time to time invade the cultivated areas of warmer climes, and by devouring everything of a vegetable nature, leave absolute desolation behind them. What compensating good do they do? True, some of the natives find them to their taste as food, and, judging by other cases, let us say, shrimps, periwinkles, and whelks as popular ones, it is even conceivable that it is only prejudice which stands in the way of a swarm of locusts forming a rich harvest for a canning factory by way of substitution for the vegetable harvest they have devoured. The succulent snail which the gardener regards as his sworn foe, and destroys remorselessly, has even been cultivated as a delicacy, and forms another exemplification of redeeming possibilities. Many kinds of vermin, however, appeal to us as peculiarly loathsome, weevils, grubs, and caterpillars to wit, and regarding mankind as Nature's masterpiece, and his perfection her sole end and aim, we can only assume that this class of pest and many others merely exist in order to exercise and strengthen the virtues of patience and fortitude by their chastening influence, precisely as the bitter blasts and the hard conditions of northern regions toughen and strengthen the races exposed to them, and by so doing have rendered them practically the masters of the world. So in horticulture, it is the constant war against the ever-invading foes, the so-called vermin, which has largely contributed to make the gardener what he is, and provides, moreover, employment for a veritable host of manufacturers and contrivers of remedial agents. Here, at any rate, is an indirect use. If, however, we were gifted with the power of "seeing ourselves as others see us," those others being the vermin themselves, we should probably learn that from their point of view, the worst vermin by far in all animate creation is that pestilent creature man himself. The poor little innocent aphis, for instance, a very lamb for gentleness and defencelessness, is born upon a rose leaf, and without dreaming of harm, or intending any, adopts that rose leaf as a pseudo-mother, and drawing nourishment therefrom, waxes fat and propagates its kind peacefully and prolifically until, if left alone, a day or two will see it surrounded by its myriad descendants. Suddenly, however, there comes between the community and the sun the shadow of a gigantic being, who either destroys the whole family with a cataclysmic finger and thumb, or more insidiously drenches it and myriads of its relatives with deadly poison in solution, or suffocates with deadly fumes. What, to the aphis mind, can possibly be the use of such organisms as man? He is a simple atrocity, an abomination of abominations, and nothing else, and in the aphis interest, ought undoubtedly to be exterminated. Considering the matter from an intermediate and wider point of view, it is, perhaps conceivable that utility to mankind is not Nature's sole end and aim, and that every organism has its own particular sphere of action and interaction, its inimical character as regards man's interests being purely accidental, and due to man's invasion of its particular domain. We may, indeed, see this exemplified within the range of humanity itself, since when civilised man comes into conflict with uncivilised races, the latter, although innocuous if undisturbed, become sooner or later wiped out, and if they resent this operation are classed with the verminous, and their utility in the great scheme of Nature called into question. It is entirely a matter of the "point of view," of the "survival of the fittest." Fortunately for man, the gift of an intellect has raised him so immeasurably above all other animate creatures that his interests are perforce paramount, and that being so, if any of the others rebel and attack what he considers his rightful possessions, and so earn the epithet of vermin, why, then, they have to put up with it, and stand the consequences.

CM 374.

MR. H. C. PRINSEP.

Mr. H. C. Prinsep, whose portrait we have the pleasure of giving in this issue, has charge of the gardens at Buxted Park, Sussex, the residence of the Hon H. B. Portman, a position he has occupied with singular success for upwards of 30 years. There is no occasion to enter into details as to Mr. Prinsep's training, but it may be mentioned that he passed through some of the more important gardening establishments in England and Ireland. He would appear to have taken full advantage of the opportunities he had for the acquisition of a knowledge of the practice and science of horticulture, for within a comparatively short period of his entering on his charge at Buxted Park he was recognised as one of the foremost gardeners of his day. While utilising to the full the knowledge obtained when preparing himself for the responsible position to which all young gardeners possessing some ambition naturally aspire, Mr. Prinsep has not slavishly followed the experience gained during his earlier years. Possessing keen powers of observation he has not been slow to make such changes in his methods of procedure as to him have appeared desirable. Many years ago he revolutionised the cultivation of dendrobiums by the adoption of a practice that was quite opposed to that which was regarded as essential to success by the general body of orchid growers. Instead of preserving the old pseudo-bulbs for an indefinite period, he cut them down to within a few inches of the base immediately the beauty of the flowers was past, and placed the plants under the conditions most favourable to a vigorous growth. The results were such as to startle those who had an opportunity of seeing the dendrobiums at Buxted Park when in bloom. No pseudo-bulb exceeded an age of twelve months, and every one was, so to speak, a wreath of bloom, the flowers being of exceptionally high quality. We might cite other instances of the splendid success achieved by Mr. Prinsep by the adoption of new methods of procedure did space permit. It must, however, be said that his successes have not been confined to the orchid house, and that he has long been regarded as one of our leading authorities on, and cultivators of, fruits and vegetables. Mr. Prinsep has also given special attention to trees and shrubs, as evidenced by the many fine kinds that have been planted in the gardens of Buxted Park during the period in which he has been responsible for their management.

Roses have this year made their growth under conditions so highly favourable that they are in the best possible state of health, and promise to yield a wealth of blooms of exceptionally high quality. In many seasons roses are stimulated into growth by short periods of warm weather early in the spring, and then seriously injured by the frosts and periods of cold weather by which these warm outbursts are followed. This year the roses were not unduly excited or exposed to frosts of sufficient severity to injure them or check the growth. Roses are considerably earlier than for several years past, and the exhibition of the National Rose Society, in the gardens of the Royal Botanic Society, on July 3, will, unless we are much mistaken, be the finest Metropolitan show the society has held for some years past. Writing to us about ten days ago, Rev. F. Page Roberts said he was then cutting tea roses of high quality, whereas last year he was not able to cut a good bloom until after the N.R.S. Metropolitan show had been held.

French Horticulturists in England.—At the present time a large party of French horticulturists are on a visit to this country, mostly members of the Société Nationale d'Horticulture de France. On the occasion of the Royal Horticultural Society's meeting on Tuesday the party, numbering about 100 members, visited the Horticultural Hall, and was received by the President and Council. After an inspection of the fine display in the hall our foreign friends adjourned to the lecture-room, where they were entertained to a light luncheon. M. Viger, the president, and M. A. Chatenay, the secretary, are accompanying the party.

Amateur Gardeners' Conversazione.—The National Amateur Gardeners' Association holds its annual conversazione, floral exhibition, and musical entertainment on Tuesday, July 7, at 7 p.m., at Winchester House, Old Broad Street, E.C. A schedule of no fewer than thirty-seven classes is provided, and there is sure to be a keen competition for the plate, medals, and cash prizes offered.

Enemies of the Apple.—According to the official report of the Board of Agriculture, published in the current issue of their journal, apples in the Wisbech district have suffered severely from caterpillars of the winter moth, and many trees have been stripped of their leaves, while the apple sucker has been very busy at the bases of the trusses of bloom. Large numbers of the winter moth caterpillars have descended to the gooseberry bushes, and attacked the berries. The quantity of winter moth and apple sucker is all the more remarkable owing to the great increase of spraying this season, but the washes do not, it is stated, seem to be of much effect against apple sucker owing to the difficulty of getting the spray fluid to touch the insect. In most cases, too, the spraying was not done sufficiently early and in many cases not thoroughly. In the Holland Division of Lincolnshire the same remarks apply as to apple sucker and winter moth, and it is believed that if good crops are to be obtained, winter banding must become more general.

Holland House Show will, as our readers have been already informed, be held by the Royal Horticultural Society on July 7 and 8, and in accordance with the custom that has obtained for several years past, the council will entertain the members of the several committees on the first of the two days.

Hanley Horticultural Fete, that is to take place in Hanley Park, Hanley, Staffs, on July 1 and 2, promises to be as great a success as its predecessors. A very fine schedule of eighty-eight classes has been provided, and fruit and vegetables, sweet peas, roses, and specimen plants are specially well catered for, while the big group class, in which a total of £85 9s. is offered as prizes, is certain to prove a great attraction. The class for a group of orchids should also produce a keen competition, as, to the first prize of £15, there is added a silver challenge cup, presented by Thomas Goodwin, Esq. Mr. Poulson, Town Hall, Hanley, is the secretary, and Mr. James Dodd is chairman of the Horticultural Committee.

Pæonies from Langport.—Messrs. Kelway and Son, who have accomplished much valuable work in the improvement of herbaceous pæonies, send us a gathering of flowers, which, as they stand in tall plain vases on our table, give further proof of the value of these pæonies for bold decorations. They are also of interest as demonstrating the wide range of form and colour that these handsome summer flowers now afford. There are both double and single varieties, and these are all so beautiful that it would be difficult were it desirable to say which were the most beautiful. To some the single varieties, with their large and elegant flowers, will the most strongly appeal, while others will attach the greatest value to the finely formed massive flowers of the double varieties. The colours range from pure white to deep purple-crimson, and include many intermediate shades of singular beauty. While extremely useful for bold decorations indoors, the herbaceous pæonies are of special value for the production of distinct colour effects, as exemplified in the nurseries of the firm at Langport. For the information of those of our readers resident within a short distance of London we would mention that at the present time there is an extremely beautiful display of herbaceous pæonies in association with foxgloves in the Royal Gardens, Kew. A more charming effect could not well be obtained, and it is being taken full advantage of by the flower painters, some three or four being seated around the arrangement daily. The pæonies and foxgloves are in the berberis dell on the east side of the gardens.

Mr. Edward Knowldin, a well-known horticulturist in the sister isle, has been appointed secretary of the Royal Horticultural Society of Ireland. The society's official address is 5, Molesworth Street, Dublin.

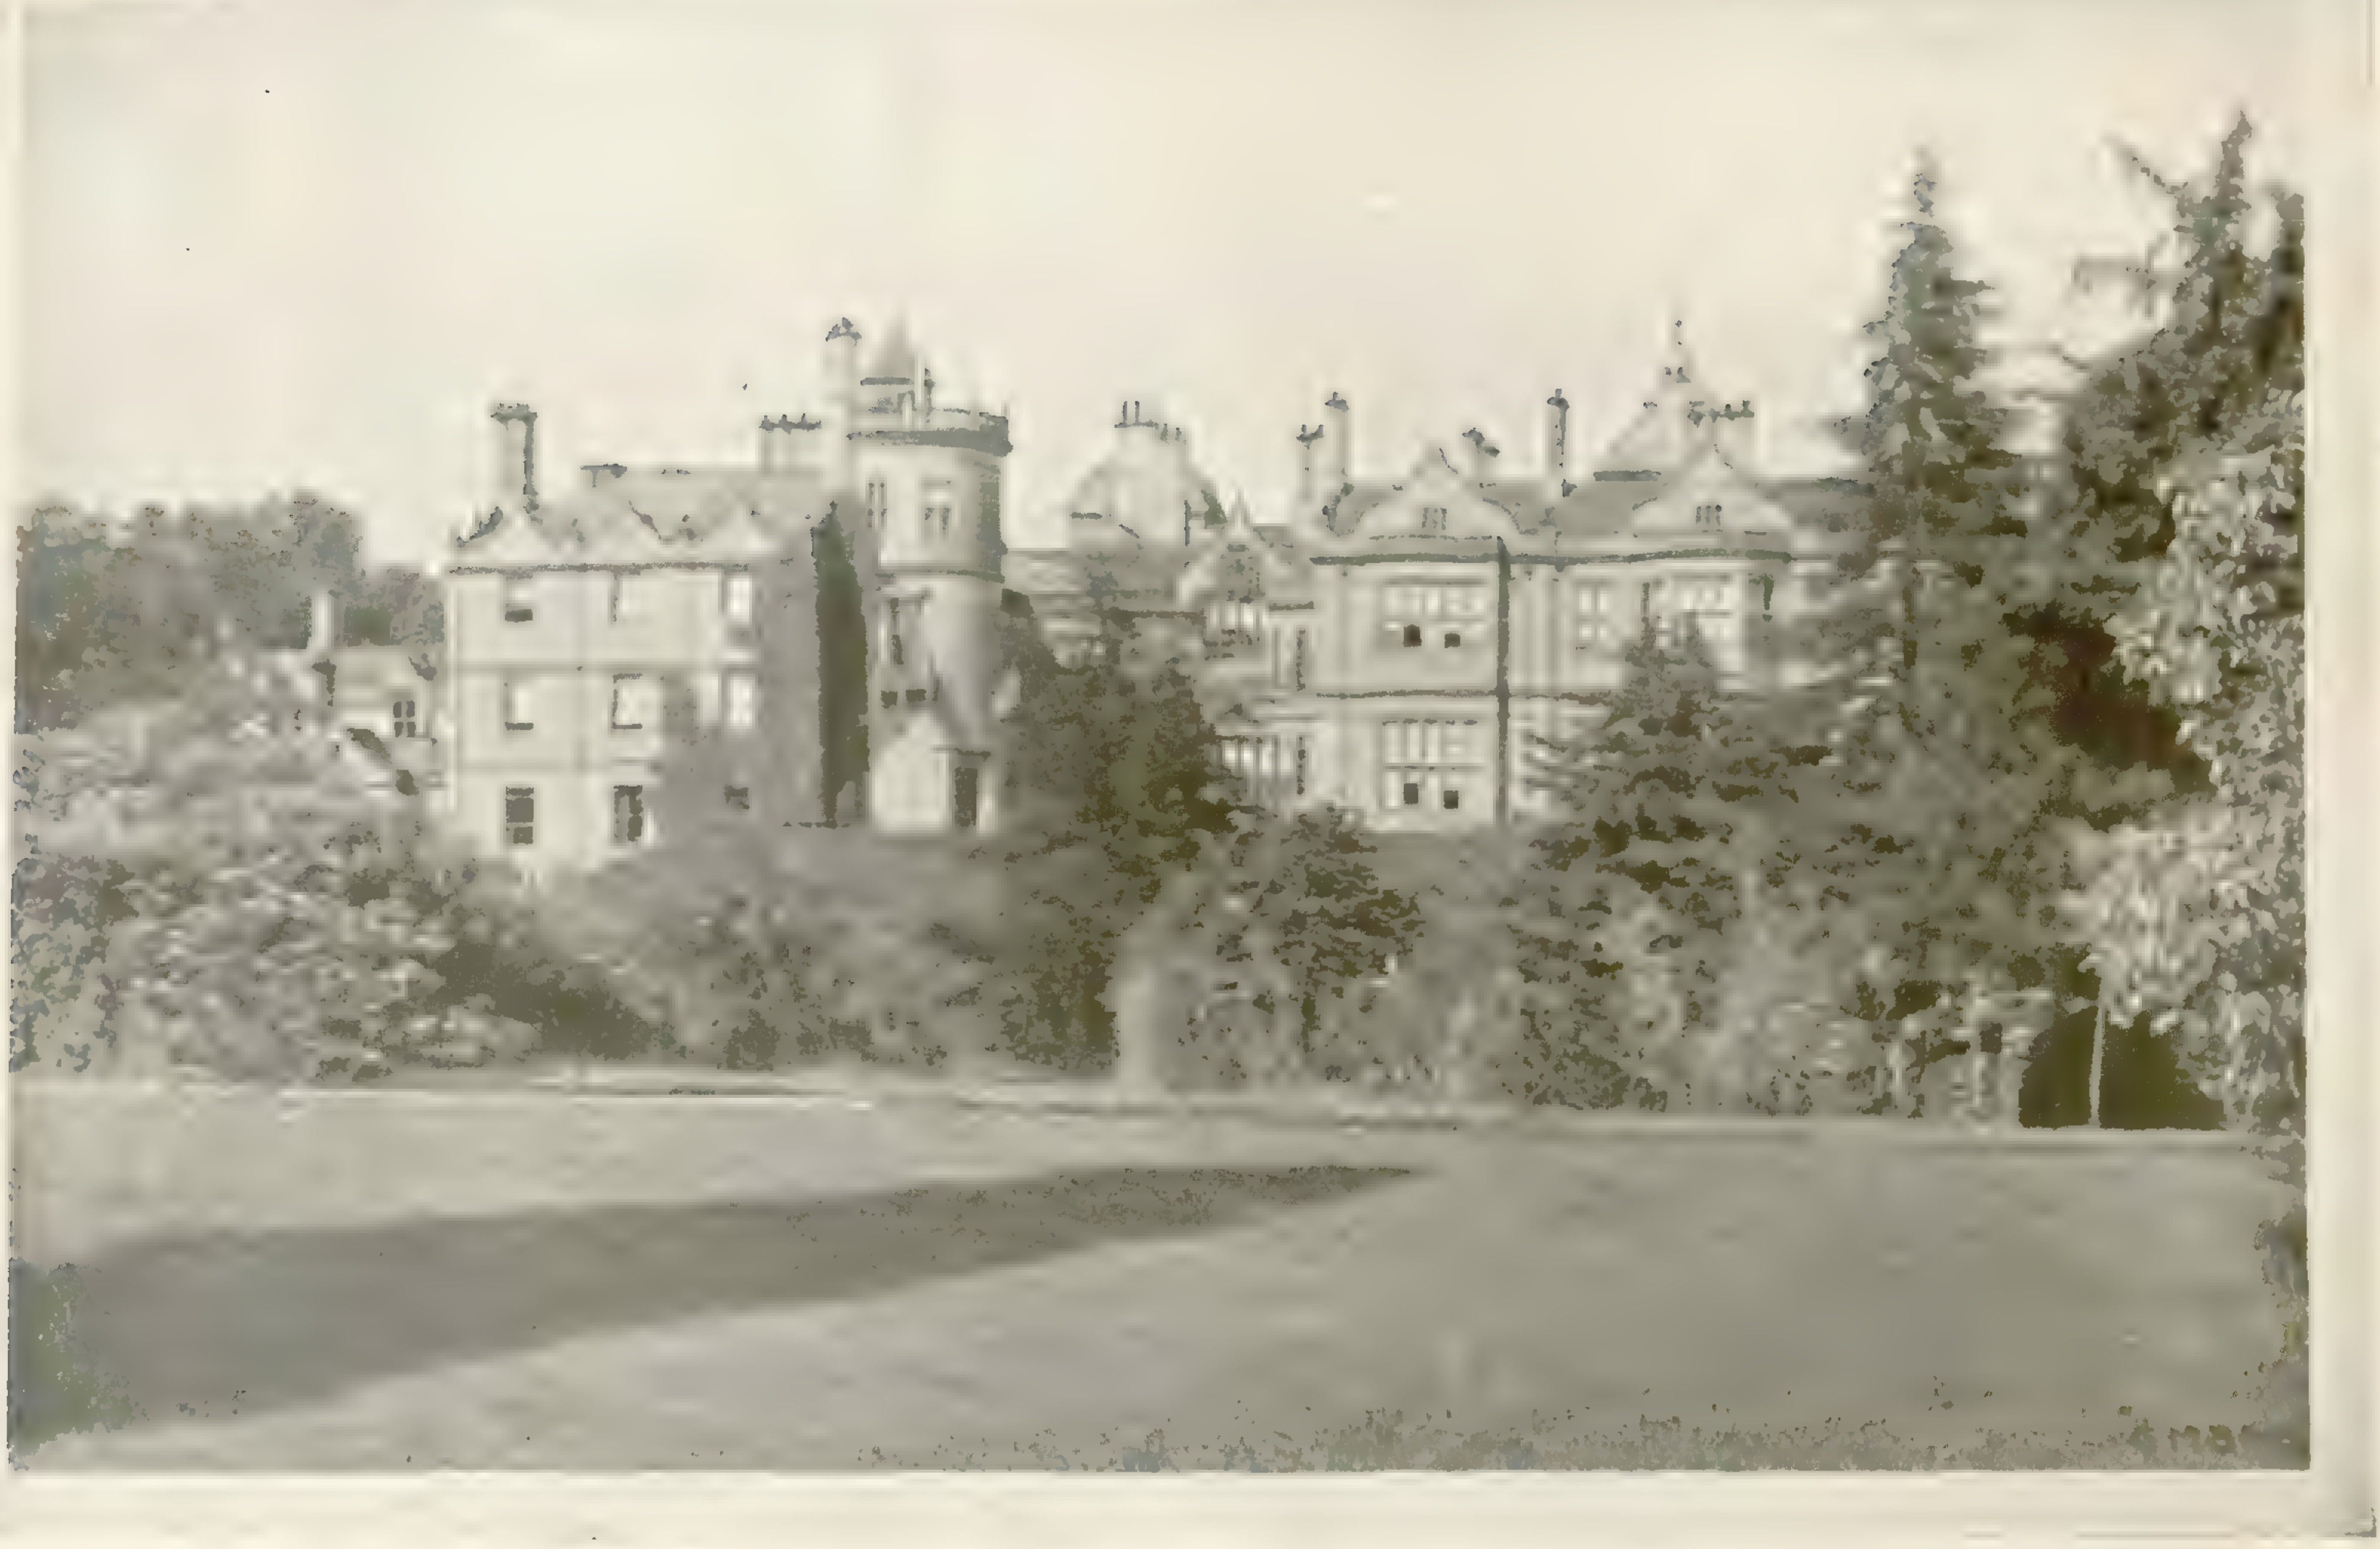
The Robinias, or Acacias, are flowering finely this year, notwithstanding the season of 1907 was regarded as not a good one for ripening up growth so as to induce free flowering in 1908. In many parts of Surrey, especially in the lovely side roads and lanes of that beautiful county, the common Robinia pseud-acacia is fairly common, and just now, with their abundant racemes of flowers and elegant leafage, they are very handsome.

National Chrysanthemum Society's Outing.—The annual outing will this year take place on Monday, July 27, when, by special permission, a visit will be paid to the Royal Gardens, at Frogmore. It is hoped that as many members as possible will avail themselves of this opportunity to visit the Royal gardens, and ladies are specially invited. The party will assemble at Paddington at 9.45 a.m., and travel to Windsor Station, and immediately proceed to the gardens. Lunch will be served at Layton's Restaurant at 1.30 p.m. After lunch there will be time for a short visit to St. George's Chapel, and at 3.30 p.m. the party will embark at Windsor Bridge on the steam launch "La Marguerite" for a trip up the river. A halt will be made at Maidenhead for tea at the Dumb Bell Restaurant (about 5.30), and after tea the party will return so as to reach Windsor in time to catch the 5.25 p.m. train to Paddington. Those who intend joining the party should at once apply for tickets (10s. 6d.) to Mr. Richard A. Witty, the secretary.

The Cours la Reine, Paris, the spot by the side of the Seine where so many beautiful and interesting flower shows have been held during recent years, is to be, we understand, greatly altered. There is a scheme on foot for removing the old and spacious glasshouses and laying out the ground in geometrical fashion after designs by Le Notre, the maker of Versailles. Room will be left for the construction of a glass house or houses for the accommodation of flower shows.

R.H.S. New Fellows.—At the general meeting of the Royal Horticultural Society, on Tuesday, 130 Fellows were elected. At the same meeting the Rev. G. Henslow, M.A., V.M.H., gave a lecture on the "Absorption of Rain and Dew by the Green Parts of Plants."

Fruit Congress at Besancon.—The Pomological Society of France will hold its annual congress at Besançon in September, when the following subjects will be discussed: The acclimatisation of fruit trees in mountainous districts; the best means of creating new markets for fruits; results of new methods of packing; the use of manures in intensive fruit culture; the use of copper preparations in combating the fungoid enemies of fruit trees; the best means of protecting fruit from the effects of spring frosts.



DUPPLIN CASTLE AND RAVINE.

SOME GARDENS ROUND PERTH—I.

Forming as it were a connecting link between the Scottish lowlands and highlands and including within its widely extended boundaries scenery peculiar to both, Perthshire is rich in interest to those in any way concerned with rural industries, and also remarkable for the diversity and surpassing beauty of its scenery. Combined in well-balanced proportions are towering mountains, lofty hills, picturesque forests, rolling meadows, and arable land distinguished for its fertility. In addition to these features, and certainly not the least attractive, is the rapidly flowing Tay, which, rising on the borders of Argyllshire, receives in its course of one hundred miles or so, nearly the whole of the drainage of Perthshire, and discharges into the sea a larger volume of water than does any other river of the United Kingdom, not even excepting the silvery Thames.

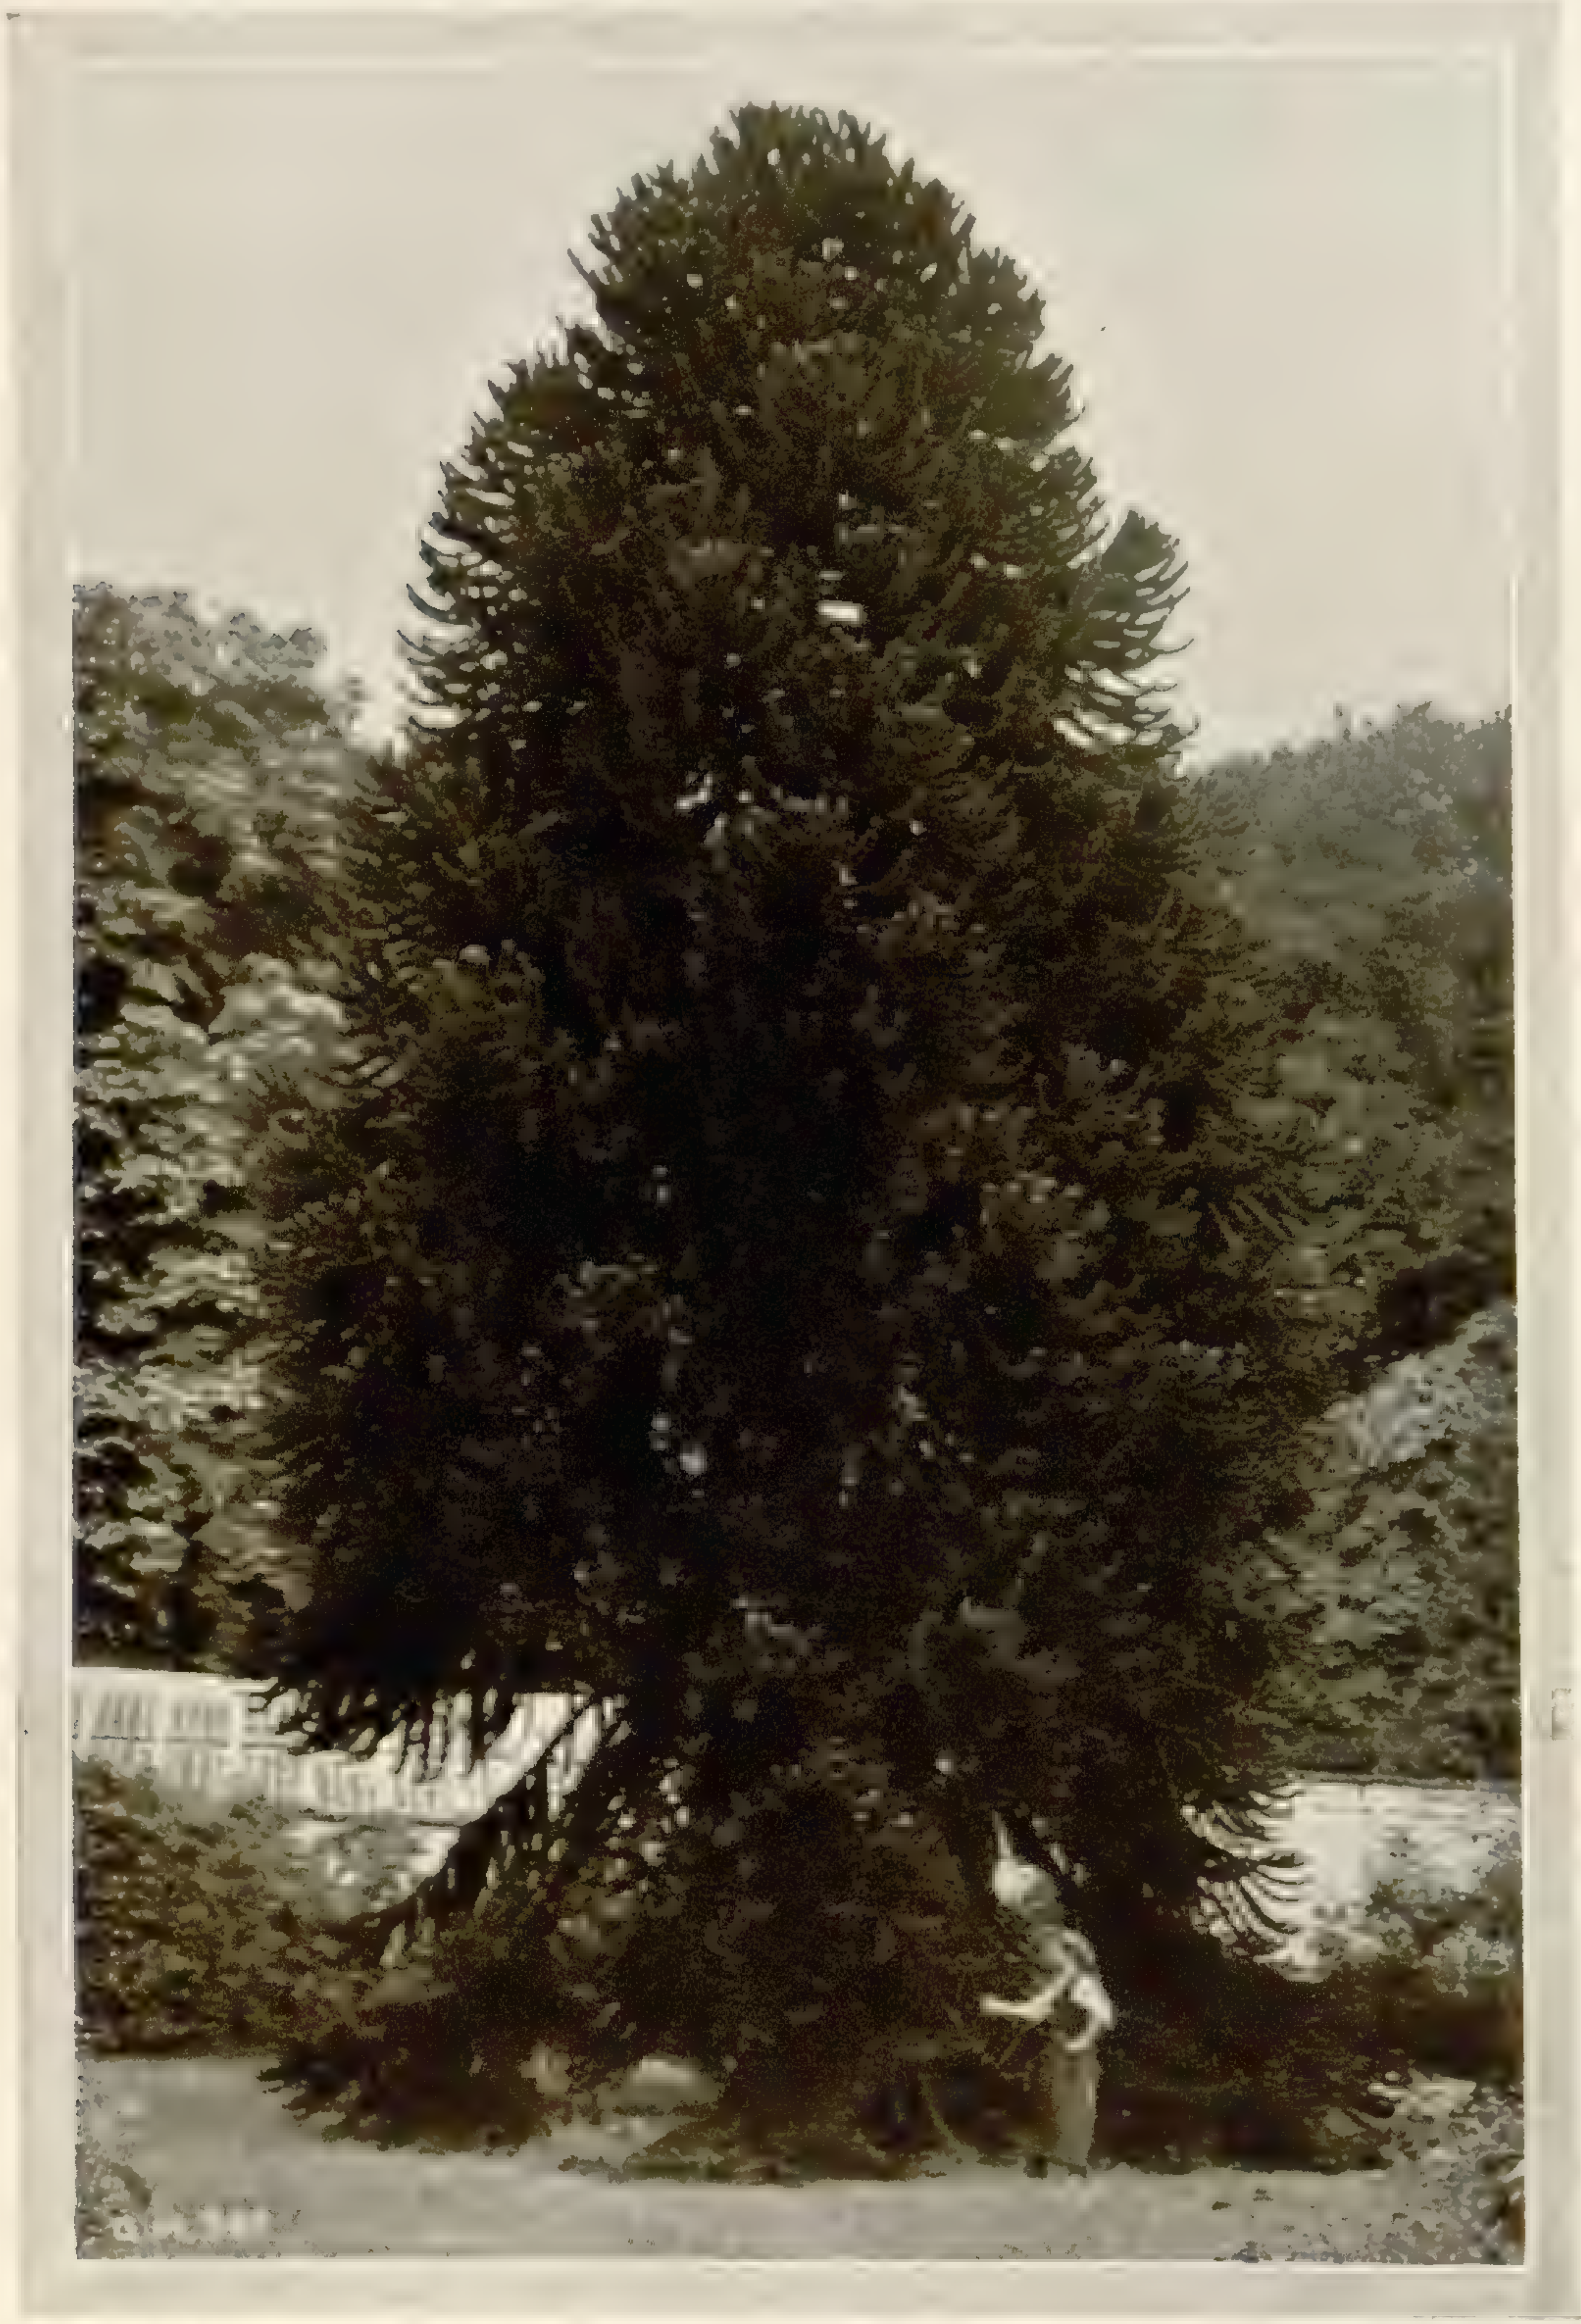
Situate not far from the centre of this fertile and picturesque county is the fair city of Perth, which has a setting of woodland, and water, and green meadows, and strongly appeals to the imagination by reason of its interesting traditions and the many stirring events that have taken place within its boundaries or at no great distance therefrom. Long the favourite home of the Scottish kings, and possessisg great natural advantages, both as regards convenience of access and the charm of its environment, it is not surprising that a goodly number of the landed proprietors of Scotland should have founded their homes within a short distance of the city, or that later on many wealthy merchants should have followed their example. There is certainly no cause for surprise that with so many great seats in the district of which Perth is the centre, that gardening should have long since acquired a high degree of importance, or that good gardens abound on all sides. As a matter of fact, the number of gardens within a comparatively small radius of the city is so large as to occasion considerable difficulty in the endeavour to give a short account of the gardens round Perth, the difficulty being due to the impossibility of making reference to any considerable proportion of the fine gardens that merit attention. Those to which reference will be made may, however, he regarded as typical of the district, and it is hoped that the description of them, if necessarily brief, will convey a good idea of the characteristic features of horticulture as it obtains in the neighbourhood of Perth.

Gardening of a high order of merit is by no means confined to the great establishments clustering around Perth, for in a walk through the outskirts of the city ample evidence was found of the great interest that is taken in the cultivation of the various classes of ornamental plants, and trees, and shrubs, by those who are fortunate in the possession of a garden attached to their place of residence. Many who have no ground associated with their dwellings have sought to satisfy their desire for a garden and secured a plot of land on an island of the Tay to the south-east of the older part of the city. I should have derived much pleasure from a walk through this colony of gardens, and had a peep into some of the hundred or more greenhouses that have been erected, but my engagements would not permit, and I had to to satisfied with a bird's eye view from the footway of the railway bridge that spans the Tay not far from the north-west end of the island; and if the contents of any of the immense number of glasshouses could not be seen, there was no difficulty in seeing that the ornamental plants and useful crops outside received careful attention, and that the plots were free from weeds.

Dupplin Castle.

Dupplin Castle, the magnificent seat of the Earl of Kinnoull, may well be regarded as a good starting point in visiting the typical Perth gardens, for not only are the pleasure grounds rich in interest and of great beauty, and the departments devoted to the production of useful crops such as to afford object lessons of immense value, but they are, by reason of their comprehensive character, able to give the visitor an excellent idea of the characteristic features of the Scottish horticultural establishments of the highest class. The castle and grounds are situate some five miles to the south-west of Perth, and the visitor has two courses open to him, he can walk or drive direct, or he can take the train to Forteviot Station and walk therefrom, a distance of between two and three miles. The scenery between the station and Dupplin Castle is pleasing, but the part of Strathearn traversed by the railway for some miles from Perth is flat, and the views obtained from the carriage windows are therefore not such as to make a strong appeal to those who have a love for the picturesque. The first of the two courses is far preferable in the case of those who are desirous of enjoying the scenery between the two points, for the road traverses high ground nearly the whole of the way, and affords a continuous succession of charming views. From the high ground that is reached at a distance of about two miles from Perth, a magnificent panorama is obtained of the city and its glorious setting, and were the ascent made for no other purpose than to enjoy the prospect, the time occupied would be repaid a hundredfold.

Unquestionably one of the most important of the many fine seats in Perthshire, **Dupplin Castle** is hardly less interesting for its historical associations than for its horticultural features, and as some of the numerous events that have had a far-reaching influence on Scottish history are recalled to mind, it is difficult to repress a feeling of regret that it is not now possible to refer to them. The grounds have an immense area, are intersected by several magnificent avenues, and are richly furnished with trees of noble proportions, and so admirably arranged as to produce a series of the most delightful effects. At the top of the finely-wooded and otherwise picturesque slopes on the southern side of the grounds, the castle occupies a commanding position and contributes a full share to the charming picture that has been created as the result of a happy combination of Nature and art. Elizabethan in style, it was built early in the last century at a cost of about £30,000, and occupies the site of the venerable building that was accidently destroyed by fire in 1827. The illustration of the southern side of the castle will afford an admirable idea of the palatial character of the building; but the trees and shrubs that fringe the ravine which passes along the south front appear in the photographic reproduction to somewhat dwarf the stately proportions; but seen from the lawn they do not convey any such suggestion. Very fine is the effect produced by the castle in its setting of trees as seen from the principal approach from the north, and of exquisite beauty is the effect obtained looking through the great masses of rhododendrons on the high ground on the western side.



A MAGNIFICENT SPECIMEN OF ARAUCARIA IMBRICATA AT DUPPLIN CASTLE.

Between the castle and the ravine is a geometric flower garden, with five handsome bronze vases of large size, and embellished during the summer months with such flowering and fine foliage plants as are found to thrive in the district. The garden on the south side is bounded by a low ivy-clad wall, and immediately beyond is the ravine referred to, through which a fine stream flows making pleasant music as it proceeds on its way to the Earn. When the grounds were originally laid out the stream was so diverted as to form a waterfall, of great beauty as seen from the windows of the castle and the flower garden. The banks of the ravine are tastefully clothed with trees and shrubs in variety, very fine being the masses of rhododendrons which give a wealth of colour early in summer, yews, roses, Cupressus Lawsoniana, and the graceful Cedrus deodora and C. atlantica, the last-named trees being represented by specimens in a high state of development. Beyond the southern lawn the pleasure grounds extend for a considerable distance, and embrace a series of slopes and plateaus intersected by broad walks of grass and gravel, and in passing through them one meets with great masses of rhododendrons and azaleas, and of other shrubs, and specimen trees innumerable.

The grounds are particularly rich in specimen trees of fine proportions, and this is explained by the fact that the noble owners have for several generations taken a keen interest in beautifying their gardens, and have been ever ready to make such additions as may have been considered necessary, and to provide for the development of the finer kinds. Coniferous trees are of much interest and great beauty, and here may be found specimens of Abies Albertiana, Abies Douglasi, A. Douglasi glauca, Araucaria imbricata, Picea cephalonica, Wellingtonia gigantea, and various cupressus, retinosporas, and thuias that are quite unique both as regards their size and development. In addition to the coniferous trees so successfully utilised in beautifying the pleasure grounds, there is a pinetum with an area of about ten acres alongside the magnificent oak avenue north of the castle. This was formed in the first half of the last century, and the trees have now reached a stage of development that affords an excellent idea of the distinctive characteristics of the respective kinds. Mental notes were made of many magnificent specimens, and of these Picea Lowi, P. monticola, P. cephalonica, P. Nordmanniana, Abies Albertiana, A. grandis, A. Hookeri, Cupressus Lawsoniana and Thuia Lobbi were the most remarkable specimens of these and of other kinds ranging from fifty feet to seventy feet in height and perfect to the ground line were quite common.

The finest of all the coniferous trees a Dupplin Castle is, perhaps, the specime of Araucaria imbricata herewith illustrated. This occupies a position in fro of the conservatory, and the figure standing in front of the tree conveys an ex lent idea of its immense proportions. I may, however, be of interest to ment that the height is between fifty and six feet, the spread of the branches over thirty feet, and 100 feet in circumference, and the girth of the tru seven feet at twelve inches from ground. The tree was planted about fif years ago, and it is extremely doubtf whether there is another araucaria in the United Kingdom to equal it. Beeche abound and there are hundreds of nob specimens, especially deserving of menti being those forming the fine avenues in t park, and the immense example of purple-leaved variety. Silver and S firs are especially fine, and there are oaks of quite exceptional proportions.

Not far from the conservatory and the araucaria is a geometric flower gar which gives a bright display of colour thereby adds appreciably to the p one has in a walk through the pictu and admirably kept grounds with th myriads of fine trees and shrubs. In furnishing of the scheme zonal and gated leaved pelargoniums. heliotropiums, violas, pentstemons nias, and some other subjects well-known are used with much Surrounding the garden a the photograph, from which the accompanying illustration has been reproduced was taken, there was a band of the elegant Newbury Gem pentstemon, which is one of the best of the varieties for summer bedding. The flowers are not so large as are those of the finest florists' varieties, but they are elegant in shape and bright in colour, and the habit is all that could well be desired. From the upper part of the flower garden a glimpse of the river Earn is obtained, as will be seen on reference to the illustration. Beyond the flower garden is a border of great length and breadth in which the finest of the hardy herbaceous plants have found a home in which they are placed under the conditions favourable to their attaining to a high state of development.

Fruits and flowers are grown under glass on a very extensive scale, and in a manner that proves to demonstration that Mr. J. Wilson is not less successful in the glass culture of these subjects than he is in the management of the other departments of the great gardens under his charge. Dupplin Castle has long been famous for its grapes, and therefore there is no occasion to speak of the splendid crops of Muscat of Alexandria and other varieties that are annually obtained. Peaches and nectarines to which several long lean-to's are devoted are of quite exceptional interest from the fact that they annually yield heavy crops of fruit of the finest quality without the aid of fire-heat. By the general body of fruit growers it is believed that while fire-heat may not be required for assisting the ripening of late crops of peaches and nectarines, it is most desirable the houses should be heated to enable the trees to receive assistance during the flowering season, and for a short time after the flowers have fallen. This is not Mr. Wilson's experience, for he annually obtains heavy crops whatever may be the state of the weather when the trees are in bloom. Finer crops of richly coloured fruits I have not yet seen, than those in these gardens. In three of the peach houses the Wilson Junior bramble was bearing a heavy crop of fruit, which is in request during its season. It would be of interest to make reference to the many charming subjects in the plant houses, but no more can be said than to suggest that as roses and carnations have a large space devoted to them, their fragrant flowers are highly appreciated at Dupplin Castle.

GEOMETRIC FLOWER GARDEN, DUPPLIN CASTLE.

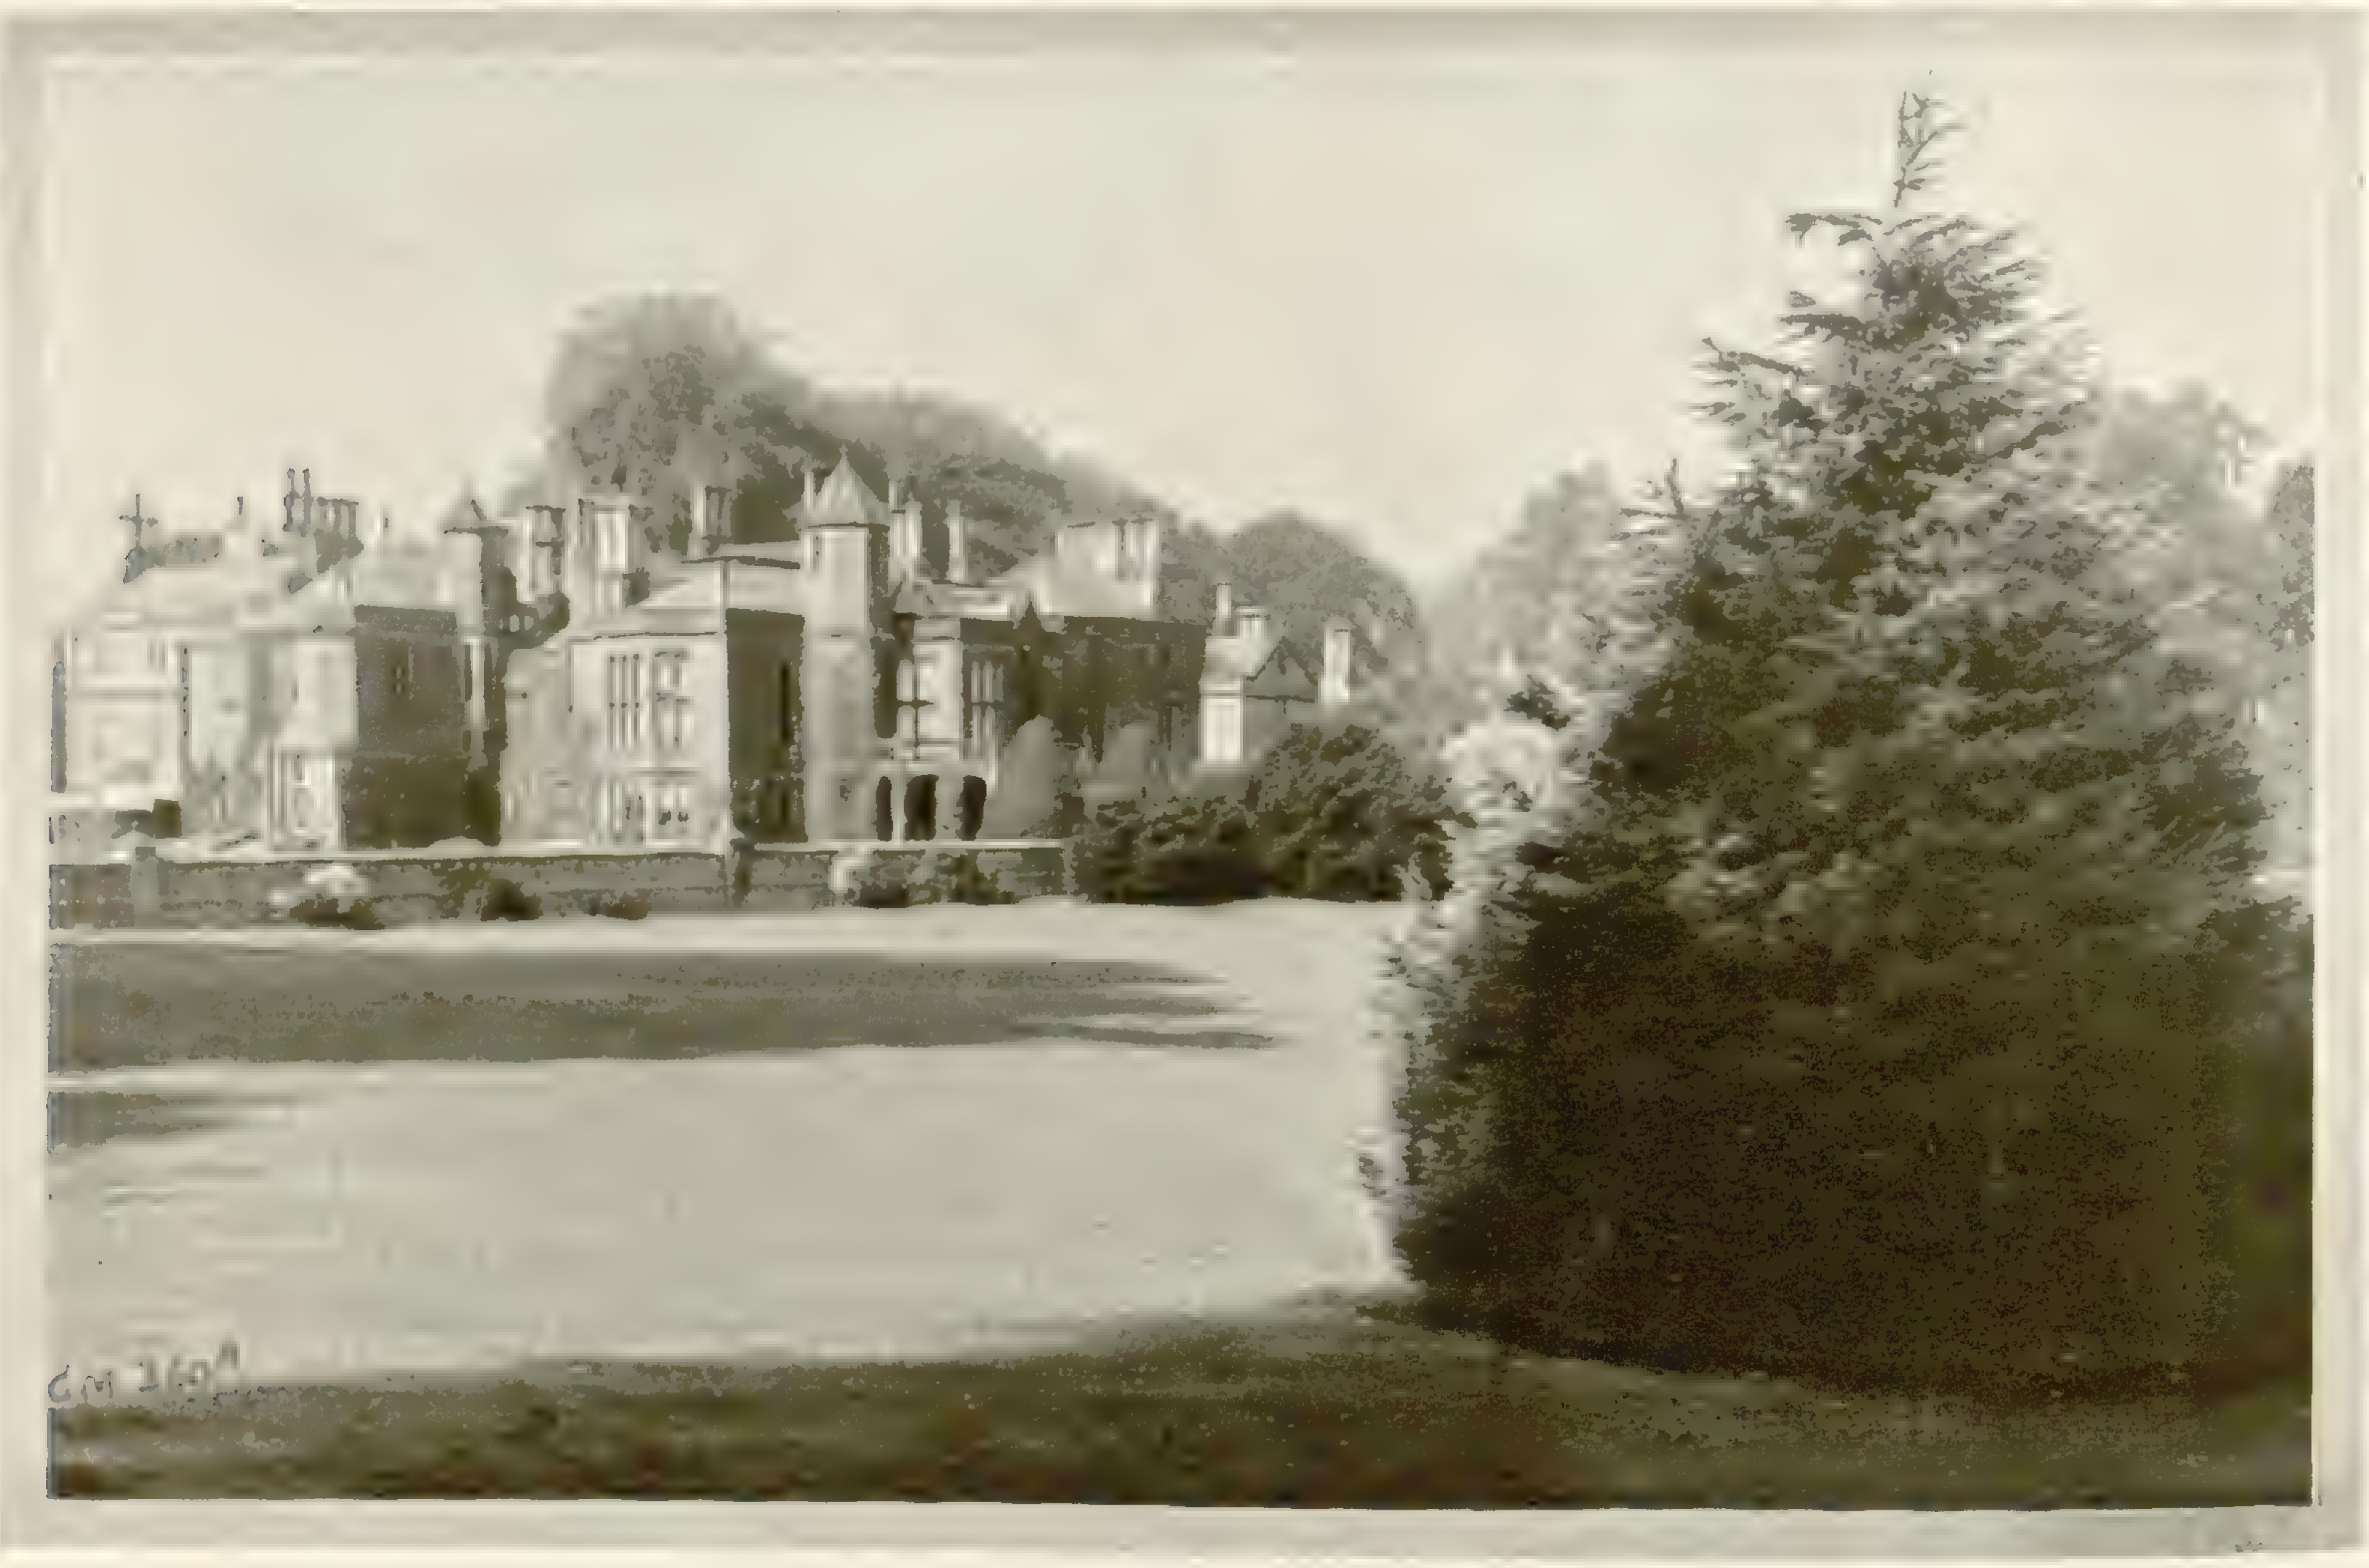
Freeland.

Freeland, the stately residence of Mrs. Wood, is situate quite close to the small but picturesque village of Forgandenny, is some two or three miles south-east of Dupplin Castle, and has for many years enjoyed considerable fame for its stately mansion, and its extensive and beautiful gardens in which coniferous trees and orchids are so splendidly represented as to form features of much importance. Much of the interest and attractiveness of this fine seat is due to the great taste and judgment of the late Mr. Collingwood L. Wood, who acquired by purchase the estate from a branch of the Ruthven family. Among other improvements he made were the enlargement of the mansion, and the extension of the gardens and woodlands; and in addition he greatly improved the hamlet that clusters as it were around the mansion, with the result that it is one of the prettiest places in Scotland, and, indeed, in the United Kingdom.

Originally the approach to the mansion was from the village, but it is now from the Dunning Road, and this is unquestionably a considerable improvement, inasmuch as visitors now pass through the broad avenue of magnificent lime trees which have an average height of 100 feet. This avenue, which is 495 feet long and 85 feet broad, was at one time in a line with the old mansion, and the space between the two lines of trees was occupied by a garden in the Dutch style with formal beds enclosed with broad edgings of box. The extensive pleasure grounds and woods would also appear to have been designed in accordance with the Dutch style of landscape, for they were laid out in a square with intersecting and enclosing avenues of trees. There is a fine avenue of beech trees commencing near the southern extension of the mansion, which forms a fine feature of that part of the grounds and affords delightful shade during the summer months. At the south end of the lime tree avenue there is an entrance to the old kitchen garden which has a history extending over seven centuries, and certainly does not afford any evidence of exhaustion, although it was some years since supplemented by a new one. Near the north end are the ruins of the old house that was destroyed by fire in 1750, and near to these is a spring known as the Lady's Well, which, in olden times, had a considerable reputation for the supposed curative power of the water. Proceeding down the picturesque ravine, or "den," which is crossed by a rustic bridge in reaching the old kitchen garden, many fine trees are met with, especially noteworthy being the elms, silver firs, and the yews, many of these being of noble proportions.

The mansion of Freeland is, as already indicated, partly old and partly new, and with its fine sweep of lawn and background of trees presents a delightful appearance. The style of architecture is well shown in the accompanying illustration, and the breadth of treatment which the grounds have received is also indicated, and the grounds should form an admirable object-lesson in the designing the ground of a stately mansion. On the far side of the wide-spreading lawn facing the mansion there is a hill of considerable height finely clothed with trees, and in front of the wood is a huge bank of rhododendrons skirted by a broad gravel walk which has on its other side groups of evergreens, specimen hollies, etc. Contiguous to the mansion are tastefully arranged beds and borders of hardy and other flowers, and to the south thereof, on the fringe of the woodland, are many specimen coniferous trees, comprising among others a remarkably fine example of the beautiful silvery-leaved Cedrus atlantica glauca.

In another part of the grounds is a large enclosure with many coniferous trees of quite exceptional merit. Along one side is a line of ten trees of Araucaria imbricata, all of large size, and every one perfect in branch and contour. Among other notable examples in the plantation were Picea Pinsapo, P. Lowi, P. Parryana glauca, P. macrocarpa, P. grandis, Cupressus Lawsonianus luteus—glowing with colour, Retinospora pisifera, Athrotaxis Doniana, Cedrus atlantica glauca, Thujopsis Dicksoni aurea, and Sciadopitys verticillata. It is difficult to convey an adequate idea of the splendid development of these specimens without giving the measurements, but that would require considerable space, and it must suffice to say that heights approaching eighty and ninety feet are quite common, and that all are splendidly furnished from the apex to the ground line. The oaks attain to large dimensions at Freeland, and one of the most noteworthy of those I had an opportunity of seeing was the handsome specimen of the variegated English oak, Quercus sessiliflora variegata, which has a height of over 80 feet, and a spread of branches closely approaching 90 feet.



FREELAND—GARDEN FRONT.

The new and old kitchen gardens have an area of about five acres, and therein the visitor finds plenty of evidence of Mr. W. Sharp's thorough asquaintance with the cultivation of fruits and vegetables. In the newer garden are the glass structures, and of special interest are those devoted to the orchids which have contributed so materially to the fame which the gardens of Freeland have so deservedly enjoyed. In the several structures are many superb specimens of the more beautiful odontoglossums, cypripediums, cattleyas, lælio-cattleyas, dendrobiums, and the finest of the forms of many other kinds. Very interesting was it to meet with a specimen of the old but distinctly handsome Dendbrobium densiflorum, measuring fully six feet across, and also a collection of vandas in the best of health. Calanthes are as a matter of course largely and well grown, and give in their season a bright display of these attractive flowers. The houses, which were built a few years since, are of teak and admirably adapted to the fulfilment of the requirements of the several classes of orchids that are so skilfully grown and successfully exhibited at Edinburgh and elsewhere by Mr. Sharp. Orchids have long formed a strong feature of the Freeland gardens, as evidenced by the fact that on more than one occasion Mrs. Wood had the honour of presenting to the late Queen Victoria a bouquet of orchids at Perth when her Majesty was passing through the city on her way to Balmoral.

In the structures other than those devoted to orchids are collections of greenhouse plants comprising the more useful kinds, and tea roses, and in the long ranges of peach houses and vineries are gathered in their respective seasons crops of great excellence.

Moncreiffe House.

On the occasion of my visit to Moncreiffe House the beautiful and highly interesting seat of Sir R. D. Moncreiffe, Bart., the weather was decidedly unkind, but happily that was the only unkindness experienced during my stay at Perth. The rain had been so heavy during the early part of the day that it was impossible to see the outdoor features of the two gardens visited without a wetting that outside Scotland would have been dangerous. But when in the afternoon Moncreiffe House was reached the rain settled into a steady downpour, it was not possible to do more than enjoy the many attractions of the plant and fruit houses which form an important feature of the extensive gardens.

Moncreiffe House, an interesting structure of handsome elevation, is within short distance of the Bridge of Earn, and its fine woodlands contribute liberally t the charms of the scenery for which the village mentioned is so well-known. Th is, for example, the finely wooded Moncreiffe Hill, which forms a conspicuous landmark and affords some of the fairest prospects in Perthshire. The mansion was built in the second half of the seventeenth century from the designs of Sir William Bruce, one of the leading Scottish architects of that time, as evidenced by the restoration of Holyrood Palace, 1671-78, having been carried out under his direction. The approach from the Edinburgh road is through a beech avenue between 600 and 700 yards long, and formed of large, splendidly developed trees. On the slopes of Moncreiffe Hill and the woods that form so characteristic a feature of the estate, are oaks, ash, beech, and sycamore of noble proportions, a about 100 years old, and with these a associated various coniferous trees th were planted forty or fifty years since, and are in a thriving state. There are many fine horse chestnuts and limes.

In the extensive pleasure grounds, notwithstanding the heavy rain, I was able to obtain a glimpse of magnificent specimens of Picea Nordmanniana, Pinus insignis, Wellingtonia gigantea, Araucaria imbricata, Abies Douglasi, A. Albertiana, A. Menziesi, Cedar of Lebanon, Taxodium sempervirens, Cupressus Lawsonianus and C. thyoides viridis, the latter being exceptionally fine. The spruces and silver are also remarkable for their development, many of these being 100 feet or so in height. I could see also that a large number of choice shrubs had found an excellent home in the pleasure grounds, but to do more than give them a cursory glance was impossible.

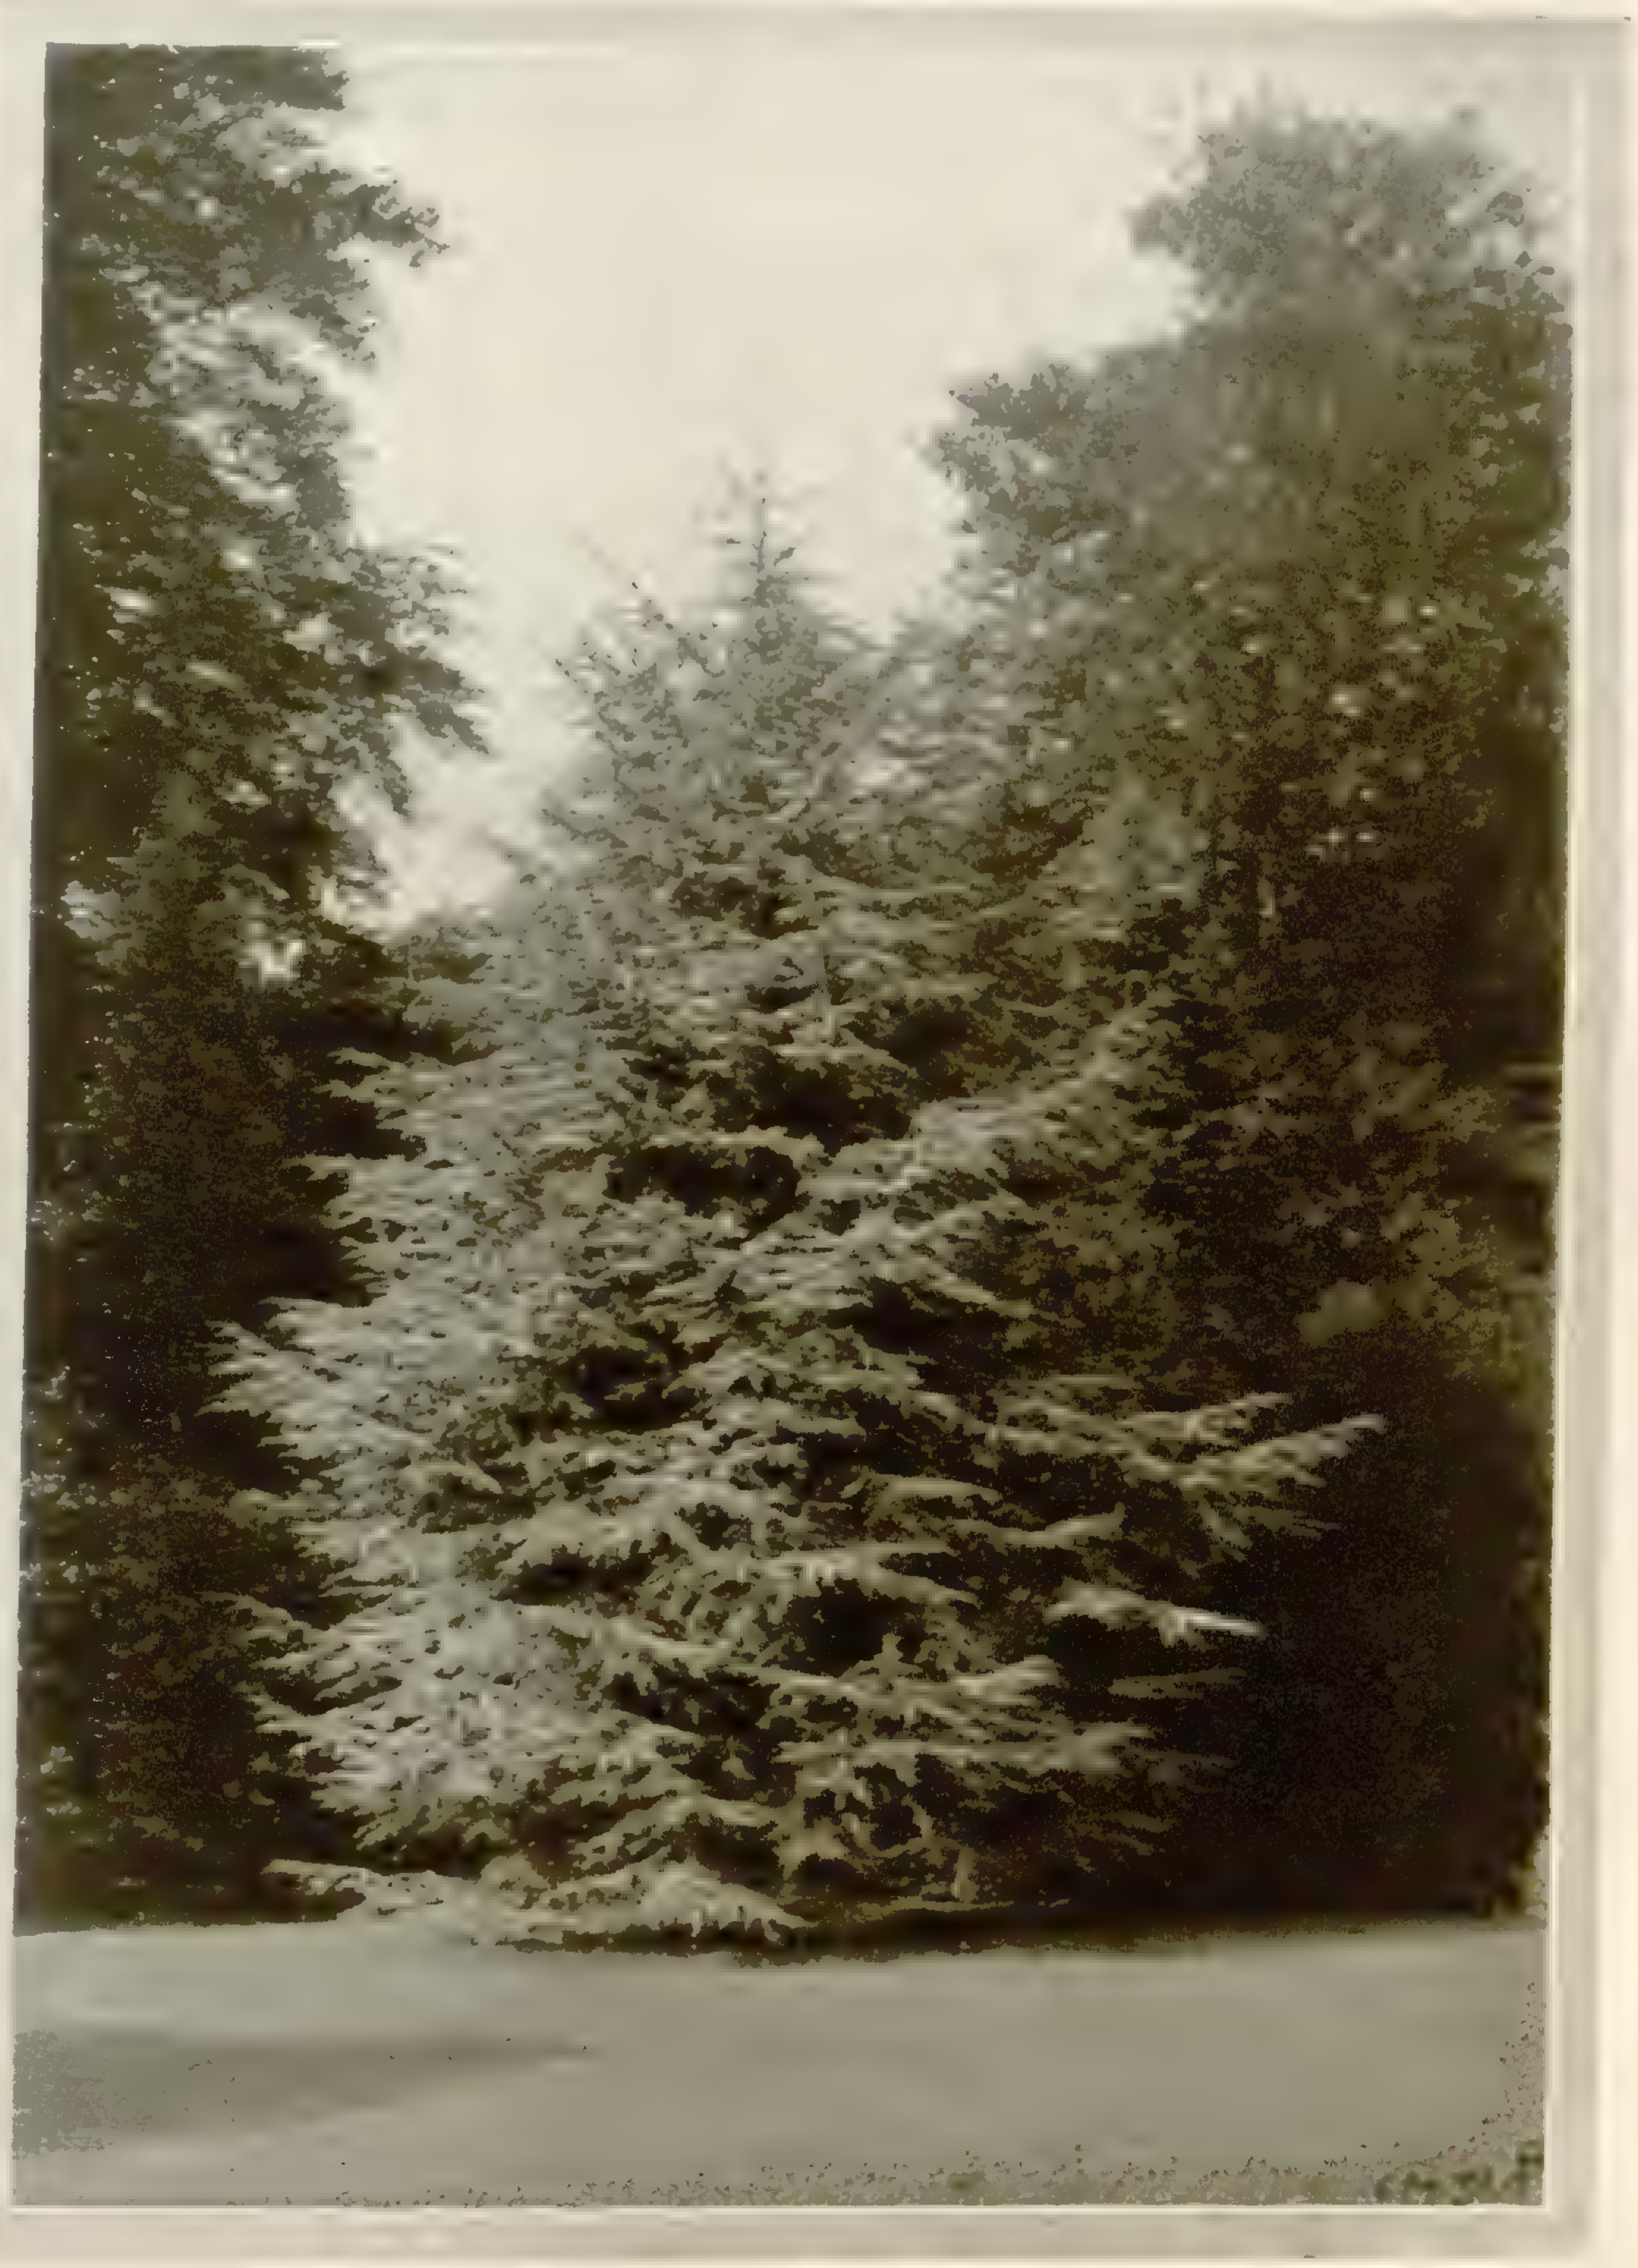
Under glass one of the distinguishing features is the collection of orchids, which Mr. A. Common, the able gardener, handles with so much skill. In passing through the several admirably arranged houses devoted to these highly attractive plants, one was struck by the fine collection of cattleyas and lælio-cattleyas, and the numerous choice lady's slippers, such as the Harefield Hall variety of Cypripedium insignis, and the albino forms of that species of which Sanderæ is one of the best known. Especially interesting is the house devoted to odontoglossums, for here are many exceptional varieties of O. crispum and other of the finer species that have of late years obtained the special attention of hybridists. Especially noteworthy is the beautiful and rare variety of O. crispum which bears the name of Lady Moncreiffe, and was some years since certificated by the R.H.S. Orchid Committee. Mr. Common, like many another successful cultivator of orchids, has turned his attention to the creation of new forms, and has already raised large numbers of seedlings. These have not as yet flowered, and with reference to them it can only be said that as they have been obtained from the intercrossing of forms of a high order of merit they should include some valuable novelties.

One might write at length on the success that is achieved in the cultivation of grapes, peaches, and other fruits in the gardens of Moncreiffe House, but in view of the fame which the Perth gardens enjoy for the splendid fruit crops produced under glass, there is no occasion to refer to them otherwise than thus briefly. The crops of melons were particularly good, and it may be mentioned as a matter of considerable interest that in not one of the stems was there evidence of canker, and Mr. Common considers the immunity of his plants from this disease due to the removal of the lower leaves from the stems. This, he considers, has the effect of hardening the tissues and thereby preventing canker.

Dunkeld House.

Situate some fifteen miles north of Perth is Dunkeld, one of the most ancient and picturesque towns of Scotland, and of much interest to horticulturists for the fine example it affords of the splendid results that may be obtained by the judicious planting of hill and mountain. With a history extending over at least eighteen centuries, there is much associated with the town that is deserving of attention, apart altogether from its great natural advantages as improved by the planters' art, but it would be outside the scope of these notes to make reference, however briefly, to them. At the point where Dunkeld and the quite modern village of Birnam nestle amid scenery of the most delightful description, the valley through which the Tay flows in its course eastward is overhung on its western side by Birnam Wood, immortalised by Shakespeare, and on the right is Craig-y-Barns, or Queen's Hill, which forms a bold background to the town of Dunkeld and its ancient cathedral, and also to the gardens and grounds of Dunkeld House, one of the two Perthshire seats of the Duke of Atholl. Much planting was done about the middle of the eighteenth century on Craig-y-Barns, and in other parts of the estate, by Duke John, who, in consequence thereof, became known as the "Planter Duke," and the result has been to add greatly to the beauty and value of the woodlands, and to increase the usefulness of the eminence mentioned as a barrier to the winds from the north and north-east.

The gardens of Dunkeld House have long been famous for their great natural beauty, and for the great success with which hardy fruits are cultivated therein. Their fame for fruit culture in the open is fully maintained by Mr. J. Stewart, who has had charge of them for some years past, and material improvements have been made in the ornamental grounds contiguous to the mansion within a recent period. The entrance to the park and gardens is a short distance to the north of the town, and the mile or more that has to be traversed ere the mansion and flower gardens are reached affords a succession of scenery of surpassing beauty. The mansion, a quite modern structure, is of simple, yet elegant elevation, and set in its charming garden of flowers and shrubs, and its wide-spreading lawns, it has so quiet and restful an appearance as to present a striking contrast to the palatial castle at Blair Atholl, the other Perthshire seat of this noble family. Some bold groups of choice trees and shrubs have been formed in the process of remodelling the grounds around the house, and already it can readily be seen that they will in a few years hence contribute liberally to the general effect. For a considerable distance north of the mansion to the ancient cathedral and the famous larches, not far from the east end of the magnificent bridge which spans the Tay, there is a great breadth of closely-shaven lawn, with many fine trees. This lawn is for the greater part of its length open on one side to the rapidly-flowing river, and on the other side the ground rises more or less abruptly, and in some parts to a great height, and is throughout finely wooded. Here we find silver firs rising to a height closely approximating 150 feet, and with splendid stems; Scots firs of quite exceptional proportions, with beeches, limes, and other deciduous trees that at once appeal to those who are interested in arborescent vegetation. For a considerable distance there is a magnificent avenue of limes, the trees rising probably to a height closely approaching 100 feet, and in other respects in a high state of development.



A FINELY DEVELOPED SPECIMEN OF CEDRUS ATLANTICA GLAUCA AT FREELAND.

On the higher ground, among the trees is a large area devoted to the choicer kinds of evergreen and deciduous trees, conspicuous among them being large and handsome specimens of Wellingtonia gigantea and other conifers. Especially noteworthy also is the tall specimen of the weeping ash. Leading from this area is the rhododendron garden, which must be wondrously beautiful in the season of flowering. Rhododendrons, hardy azaleas, and kalmias luxuriate under the conditions that obtain at Dunkeld, and attain to a size that is by no means common, and in proof thereof it may be mentioned that one of the examples of Kalmia latifolia has a height of nearly ten feet and a diameter of over twelve feet. On still higher ground in the park are fine examples of the Japanese larch (Larix leptolepis), one of the most elegant of conifers, and a tree regarded with much favour at Dunkeld.

Dunkeld House has for a century or so been regarded as the Scottish home of the larch, for within its grounds five of the first larches were planted, and of these two still stand as sentinels over the cathedral, but of those one, unfortunately, is dead. In the year 1738 Mr. Menzies, of Culdares, Glenlyon, brought a few small plants of the larch, that had been obtained from the Tyrol, home with him, and of these gave five for Dunkeld House and eleven for Blair Castle. They all soon became established, and grew well, and two of the former were felled in 1809, and of these one contained 147 cubic feet of timber, and the other 168 feet. The dimensions of the live tree is, according to the tablet affixed, 102 feet high, girth at three feet 17 feet 2 inches, girth at 68 feet 6 feet 1 inch. There are numerous other fine larches in the grounds that closely approach this specimen.

The kitchen garden, with its well-clothed walls and its admirably furnished fruit and plant houses, and its fine breadths of vegetables, well merit a somewhat full notice, but space will not admit of the department being dealt with otherwise than in the briefest manner. As will be seen from the accompanying illustration it is situate on the side of a high hill, and has been arranged to form a series of slopes and terraces. Running through the centre is a broad walk flanked by flower borders; on the central terrace is a handsome fountain, and at the top is a pavilion, from which a fine prospect is obtained of the county to the south-west.

George Gordon.

*** The second of the two articles on notable Perthshire gardens will appear in our next issue (July 4).

VIEW IN RHODODENDRON GARDEN, DUNKELD HOUSE.

SWEET PEAS IN THE HOME.

The sweet pea is a flower without legendary history, scarcely sung at all in verse, and few persons even seem aware that it is emblematical of "delicate pleasures." It has all its poetic reputation to make, although its one for beauty, combined with fragrance, is now so well established. There is merit in its popular name, since this distinguishes it as the sweet one among its relatives, yet its lovers perhaps wish that some more titles could be bestowed on a blossom so worthy.

The schizanthus has become dear to us as the Butterfly Flower, on account of the dark spottings upon pale petals. Why should not the sweet pea, made up of wings folded beneath a standard, be christened Angel Flower?

It is, beyond all others, a blossom for the home. Simple, graceful, of all artistic shades, perfumed deliciously, easy to arrange, appreciated by all, perfect in bouquets, or for bodice and buttonhole sprays, we may well doubt whether it is possible to sing its praises too highly.

With grasses of the field sweet peas make ideal table decorations, of course, also with the myriad-blossomed gypsophila, but we ought sometimes to give it dainty greenhouse ferns for a setting, the smaller kinds of maidenhair being especially suitable. Nor should there always be great masses of grass or fern and only a sprinkling of the flowers; the plan is elegant, but a change is wrought by filling vases first with as many sprays of blossom as possible, all of one colour, preferably scarlet for a blaze, and then thrusting in half a dozen or so spear-head grasses, just to give height and breadth. By this means we make use of the sweet pea as a gorgeous-hued blossom. A pale pink sweet pea similarly employed will give the same colour mass as a bowlful of La France roses, while the mauve of Dorothy Tennant is a shade that the eye never tires of.

Perhaps white sweet peas are never quite so lovely as when arranged alone with Gypsophila elegans instead of foliage. The vases should be of clear white glass, preferably with silver mountings, then the effect will be fit for any wedding breakfast. For a dinner party this scheme may well be carried out, but colour given by having a large mat, or table centre of vermilion velveteen or satin; this looks well cut of diamond shape, and closely edged by white glass troughs, or a series of tiny bowls, similarly filled with white peas and gypsophila.

To be able to afford to gather great branches of sweet peas is a joy indeed. How seldom do we see the natural growth of the flower in vase arrangements, yet it is of perfect gracefulness, and the unopened buds complete the lovely symmetry. Ask for a bunch of sweet peas from a florist's garden or that of a friend, and the supply is sure to be of single ste- bearing fully-opened blooms. Yet, wher- ever peas grow luxuriantly it is wise to c them with more freedom, the autumn harvest proving the later for it.

Sweet peas in pots are too much ne lected, or grown only for shows: they [illegible] thrive for weeks in sitting-room wind giving much delight, and are espe charming on the ledges of window se at the ends that join walls up which th appear to be climbing, or aga the inner upright frames of ca ment windows. Groups of pot sw peas are quickly arranged in halls, [illegible] dors, or odd corners of the drawing-r but are extra beautiful, as well as [illegible] when employed to fill up the firep Colour schemes should be carefully th out, pink of two shades, with white, [illegible] generally popular. To hide the [illegible] a close row of ferns, mosses, and [illegible] plants will be needed in front; a [illegible] effect results from using only silver-[illegible] subjects, of which Cineraria maritima [illegible] familiar example.

M. H

THE SIKKIM PRIMROSE.

Among the numerous species of primula which, on their first introduction, appealed to the admirer of this beautiful and varied race, few have so well maintained their hold upon the attachment of the cultivator as the charming Himalayan species known to us as Primula sikkimensis, or the Sikkim primrose, although cowslip would possibly be more appropriate from the nature of its inflorescence. However this may be, Primula sikkimensis has held its own well in gardens for the half-century and more since it was introduced, and there are few who have possessed it once who care to be long without it. Its absence from many gardens where it has once been cultivated is due to no lack of favour, but simply to the fact that its life is often too brief, and that it requires replacement by young plants at intervals. This is a drawback in the eyes of those who set their affections to more permanent things, and who do not care to be at the trouble of sowing a pinch of seeds now and again, so that their plants may have successors to fulfil their mission when they themselves have passed away.

It is undeniable that the Sikkim primrose is short lived, but the duration of its existence depends to some extent upon the conditions under which it is cultivated, and, even if only a year or two should see it depart, it is so easy to replace from seeds that no one who admires the primula need want it long. There is something so exceedingly attractive about it that it never fails to please, even if the plants have not attained the full vigour they reach under favourable conditions.

It seems almost superfluous to describe this well-known plant, but one knows from experience that there are always many readers of these pages who are unacquainted with some such flowers, and even those who have "loved and lost" will not be unwilling to be reminded of the plant, with its neat, wrinkled leaves, its beautiful mealy stem, its drooping yellow flowers, soft in colouring, and fragrant as of honey, and the whole pose of the primula, as its stem, some foot and a-half or two feet high, rears itself among dwarfer flowers, and we see these pretty blooms dangling from the top of the umbel. The flowers are not large, it is true, but they are beautiful, and they are plentiful, for a good strong plant may have as many as forty or even sixty blossoms in each umbel. Such a plant is worth some trouble, and but little is required to secure it.

The true term of the life of Primula sikkimensis is difficult to predict or state with any certainty. As with many flowers, "it all depends" upon certain circumstances, not always within the ken or the power of the grower to command. For one thing, as a moisture lover, this primula is impatient of drought in summer, and one has seen plants become weakened and finally destroyed for the want of a little timely assistance from the watering can. It is also unable to stand for long the non-covering of its crowns with soil, and some experiments with good examples have shown one how much a little care in this respect is needed. Then, in certain light soils, the plants are occasionally lifted by frost, and, if not pressed back into the soil, death is sure to follow.

A pinch of seeds sown each year or two will be found well worth the little trouble it involves. They can either be sown under glass or in the open, and if a little bare space is left near the plants self-sown seedlings will generally spring up. One has found this often, and one recollects some pretty effects produced by such self-sown plants appearing, growing in strength, and finally blooming in the most unexpected, but most picturesque places, such as by the margin of a little runnel, constructed to carry the water to a water lily tank.

Primula sikkimensis has a liking for water, and by the margin of a little stream, but above the reach of the water, or at the edge of a pond, it is quite at home, and will frequently seed and reproduce itself without any trouble, save preserving the young seedlings from destruction as "weeds," no small peril in ignorant hands.

If, however, the seeds are to be sown under glass, this can be done either when they are ripe in summer or in spring, a light compost being used, and the seeds no more than covered. Cover the pot or pan with a piece of glass and a sheet of paper; water carefully when required, remove the glass when the seedlings appear, give air gently, prick out timeously, and plant the following spring where they are to bloom. All going well, a pretty sight will be presented by a good clump in full flower.

S. Arnott.

WALK THROUGH KITCHEN GARDEN, DUNKELD HOUSE.

Eupatoriums.—These are very useful where flowers in quantity are wanted, either in a cut state or upon the plants, during the winter or early spring months. They are of specially good service for large conservatories or greenhouses, where it is impossible to grow many of the hard-wooded plants with that success one desires to see. Being plants of easy culture and of rapid growth, it is not a difficult matter to grow on a stock every year, keeping only the best of the previous season's propagation, so as to have some, at least, of larger size. I find Eupatorium Weinmannianum and E. odoratum both useful. Growth is too luxuriant if the plants are overpotted, or treated with stimulants before the flower trusses are well advanced.—T. B. Field.

EVERGREEN FLOWERING SHRUBS.

The greater part of our flowering shrubs consist of what are termed American plants, as they include all the rhododendrons, heaths, andromedas, kalmias, and many others. For these a fairly moist soil is essential, and if it is of a peaty nature so much the better. Not that this is absolutely necessary, as rhododendrons may in many districts be found thriving in pure loam.

Beyond the American plants, however, the choice of shrubs of a strictly evergreen nature, yet with showy blossoms, is a decidedly limited one. Of course, all flower, but in many of them the blossoms form quite a minor item. Such as the laurel, for instance, which, in full bloom is decidedly attractive, but it is chiefly considered as an evergreen shrub pure and simple.

YORK JUBILEE FETE AND GALA—MESSRS. J. BACKHOUSE AND SON'S FIRST PRIZE ARRANGEMENT OF ROCK PLANTS.

The chief of those that can be described as flowering evergreen shrubs are, omitting American plants, as follows:

Berberis.

The barberries, as a group, include several of our very finest flowering evergreens, for all of those enumerated are very beautiful. Berberis aquifolium is a well-known shrub with pinnate leaves of a stout leathery texture, and clusters of golden blossoms borne in early spring. Of these there are several forms, but all are beautiful. These were formerly known as Mahonias. Berberis buxifolia, known also as B. dulcis, is an early flowerer, for the bright yellow blossoms hanging suspended singly by long stalks are at their best frequently in the month of April. Berberis Darwini, a particularly valuable evergreen, whose orange-coloured flowers, borne in great profusion, form a notable feature of many gardens in May. Berberis empetrifolia, a little spreading shrub with narrow leaves, has golden flowers at their best at much the same time as the preceding. Berberis japonica has very long pinnate leaves, exceedingly stout in texture, and bears spikes of pale yellow flowers early in the year. Whether Berberis stenophylla or B. Darwini is the finest member of the genus is at least an open question, but both are exceedingly beautiful. In B. stenophylla the flowers are golden yellow, and the habit of the plant is more graceful than that of B. Darwini. Berberis Wallichiana is a sturdy, low-growing bush, with dark-green spiny leaves, and pale yellow flowers borne after all the others are past. For this reason it is well worthy of notice.

Choisya ternata.

At one time this, known as the Mexican Orange Flower, was looked upon as very tender, but it is now fairly recognised as hardy in many districts, and withal a beautiful flowering shrub. The white fragrant blossoms are borne in May and June. Even where rather tender it is a delightful wall shrub.

Cistus.

On warm dry soils some species of cistus are valuable flowering shrubs, but in cold localities they are more or less tender. The hardiest and most showy are: Cistus ladaniferus, white, with a dark red spot at the base of each petal; and Cistus laurifolius, with large white blossoms. The cistuses flower during the summer months.

Escallonias.

These are in many districts somewhat tender, but even if injured by the frost they often recover quickly. In the south of England and in many places around the coast they are exceedingly beautiful. The vigorous growing E. macrantha, with bright red blossoms, will flower throughout the summer. Other kinds that may be especially mentioned are E. exoniensis, whitish; E. langleyensis, pale red; and E. rubra, bright red.

Garrya elliptica.

Though the male catkins of this Californian shrub are not brightly coloured, they, from their length and graceful disposition, form such a striking feature that it well merits a place among flowering shrubs. In cold districts it is a charming wall shrub.

Hypericum calycinum.

This, the St. John's Wort, is one of the most persistent of the hypericums, and a delightful low-growing shrub. Some very fine kinds are deciduous, or at most only sub-evergreen in character.

Lavendula spica.

The lavender is a very general favourite, the fragrance of its blossoms being admired by everyone. Added to this the soft greyish-green of the foliage is most restful to the eye.

Ligustrum.

Two species—L. japonicum and L. lucidum—have strictly evergreen foliage, and towards the end of the summer their panicles of white flowers are decidedly ornamental. The best of all the flowering privets—Ligustrum sinense is sub-evergreen in character.

Magnolia grandiflora.

Totally unlike any other tree or shrub in our gardens, this magnolia, from the Southern United States, stands out as one of the grandest of all evergreens. The bold leathery leaves of a rich, glossy green render it from a foliage point of view alone a striking object, and when in addition the specimen is dotted with its large chalice-like blooms of the purest white and deliciously fragrant, there is nothing else with which it can be for one moment compared. Though quite hardy in some districts it is in many gardens more suitable for training to a high wall or dwelling-house.

Olearia Haasti.

The olearias, known popularly as daisy trees, are natives of Australia and New Zealand. From this last-named district we get the only thoroughly hardy species, viz., O. Haasti, that forms a dense growing bush clothed with dark green box-like leaves, and towards the end of July and in August it is thickly studded with clusters of small white flowers.

Ulex.

Perhaps the different members of the furze family are seldom given the position that the great beauty of their blossoms entitles them to, as they are really gorgeous when in bloom. The double furze in early spring and the dwarf furze (Ulex nanus) in the autumn are among the most striking of all shrubs.

Veronica.

In the particularly favoured districts of England many of the veronicas are remarkably showy, but the only one that can be depended upon around London is V. Traversi, a much branched bush about 4ft. high. In early summer the spikes of very pale lilac blossoms are borne in great profusion.

Viburnum Tinus.

As a valuable winter flowering evergreen this stands in the foremost rank, but its merits in this respect were so well told in the GARDENERS' MAGAZINE as recently as January 25 that nothing further remains to be said now concerning it.

Vinca.

The periwinkles form a pretty class of trailing evergreens, but from their lowly stature they are seldom regarded in the light of shrubs. For clothing banks and similar purposes they are, however, delightful.

In favoured districts or with wall protection in many parts, other flowering evergreens may be successfully grown. Among them are: Berberidopsis corallina, camellias, Carpenteria californica, ceanothus of sorts, Desfontainea spinosa, Fabiana imbricata, Ozothamnus rosmarinifolius, Tricuspidaria lanceolata, which used to be known as Tricuspidaria dependens.

W. T.

Plants in Tubs.—Agapanthus, hydrangeas, fuchsias, zonal and ivy pelargoniums, marguerites, and other plants in large pots or tubs that have been grown for standing on terraces and walks should now be brought into their summer positions, if possible giving the most tender or brittle ones the most sheltered positions; see that none are stood so that the drainage will be choked.—E. F. H.

YORK JUBILEE FETE AND GALA—MESSRS. ARTINDALE AND SON'S SECOND PRIZE ARRANGEMENT OF ROCK PLANTS.

NOTES FROM KEW.

◆

Felicia reflexa.

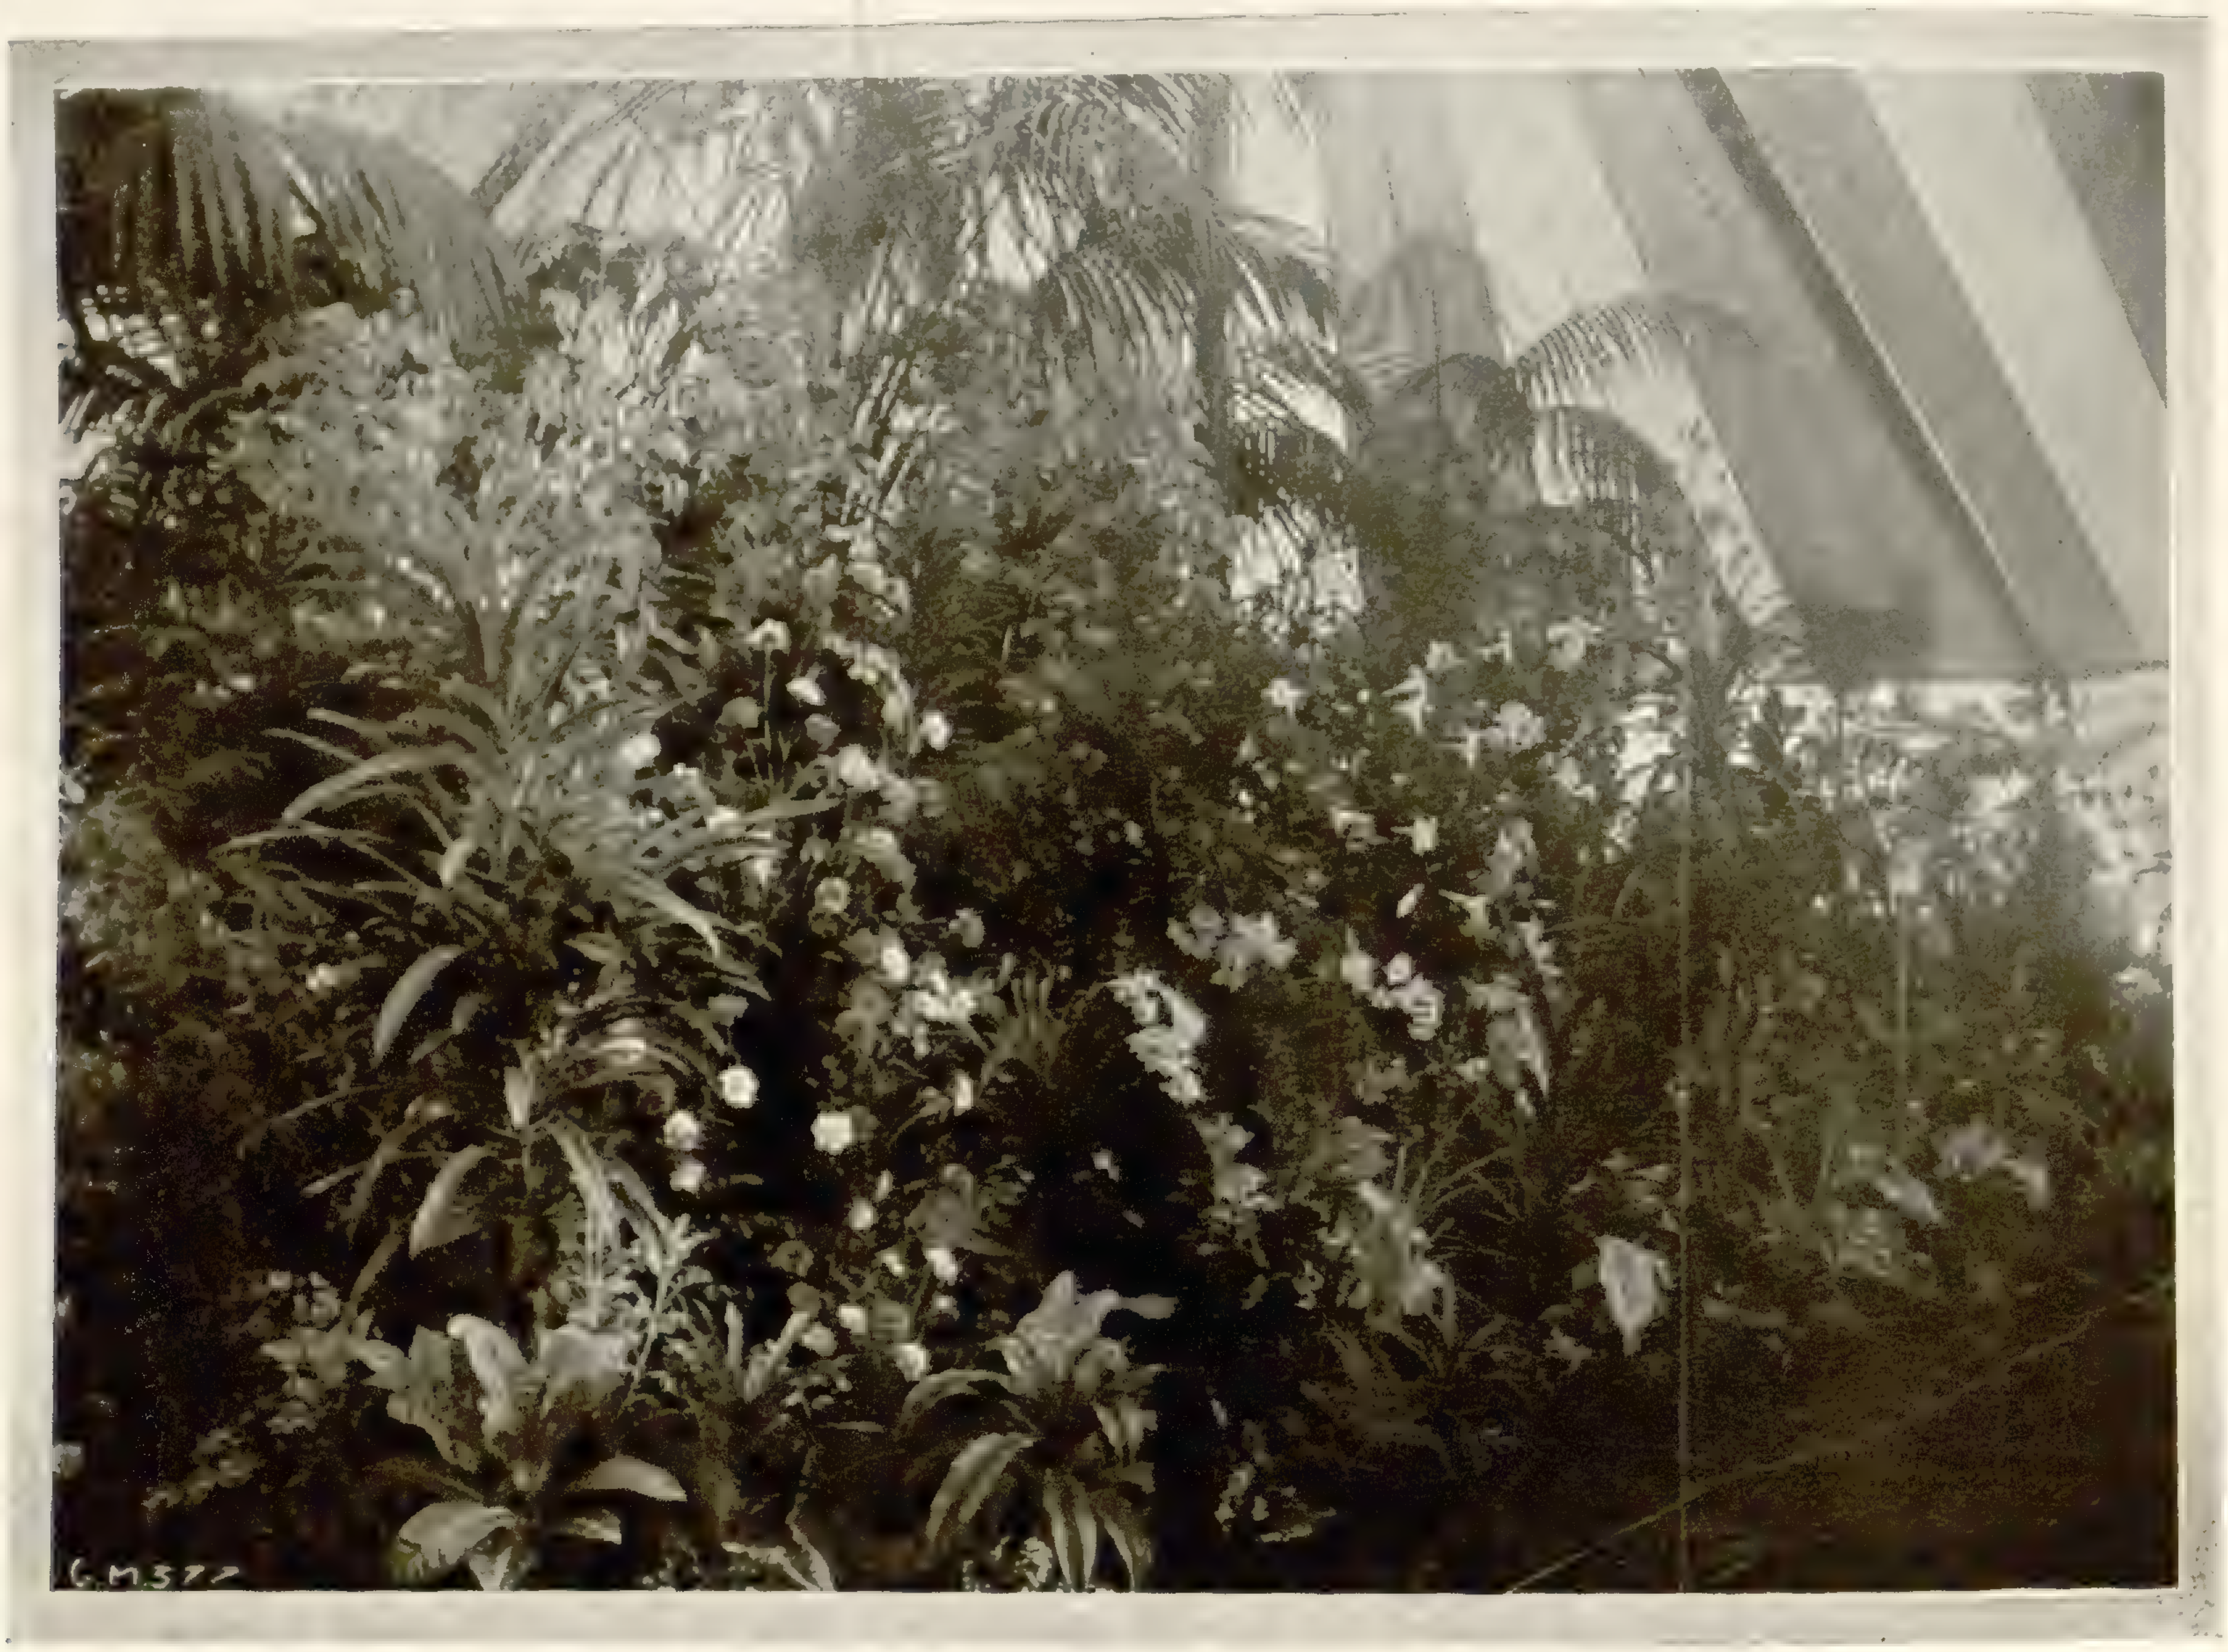
This very uncommon shrubby member of the Aster family is flowering freely in No. 4 greenhouse, and judging by the neat examples that may be grown in five inch pots it might with advantage be made more use of than it is. Introduced from South Africa in 1790, it is by no means a novelty, but I have not been able to find mention of it in any catalogue to hand. The "Dictionary of Gardening" gives the colour of the flowers as red or white, neither of which applies to the Kew plants. As seen there this felicia forms a rather upright plant, whose several shoots are in most cases pushed out from one main stem at a little height from the ground. Each shoot is terminated by an Aster-like flower head about 1½ inches across, being composed of deep mauve coloured guard florets surrounding a yellow disc. The leaves are very small, and of a rich green colour. The height of the entire plant is not much over a foot.

Impatiens.

Beside the original species of the Balsam family such as I. Hawkeri, I. Holsti, I. Olivieri, and I. Sultani, there are now several garden forms in whose production one or other of these species have doubtless played a part. A group of these in the greenhouse consists of plants whose blossoms show a great variety of colour, some of them being of much paler tints than usual. Among them all I. Holsti with its uncommon vermilion tint stands out in a marked manner. This Balsam is also valuable for bedding out during the summer.

Clianthus Dampieri.

Time was when this Clianthus used to be considered an extremely difficult plant to cultivate, but at Kew, grown in suspended baskets, it is very satisfactory. Not only is the typical kind, with its rich scarlet flowers and almost black boss laden with blossoms, but the scarcer variety—marginatus, in which the keel of the flower is white margined with scarlet is equally satisfactory. It must be nearly 40 years since I saw a magnificent specimen of Clianthus Dampieri in the (at that time) celebrated nursery of Messrs. Henderson, at Maida Vale, but thriving plants are as a rule few and far between. Though Clianthus Dampieri attracted the attention of the earliest travellers in Australia, according to "Hortus Veitchi" it first flowered at Exeter, and was exhibited before the Horticultural Society of London at St. James's Hall, on April 21, 1859, and awarded a silver medal.



YORK JUBILEE FETE AND GALA—MR. W. HOLMES' FIRST PRIZE GROUP OF PLANTS ARRANGED FOR EFFECT.

Echium Wildpreti.

A very striking biennial plant and of considerable value for greenhouse decoration. The first year from seed it forms a dense rosette of long, narrow, silky leaves. The second season the stem lengthens, ultimately reaching a height of 3ft. to 4ft., or even more. The greater part of this height is made up of a very dense, erect panicle of flowers, in colour a peculiar shade of reddish-pink. It may be bloomed effectually in a smaller state than its near relative the blue-flowered E. callithyrsum, which is also remarkably attractive. This is flowering in the Temperate House.

Lathyrus pubescens.

Kew has done a great deal to demonstrate the beauty and value of this member of the pea family, for it was almost unknown when first it attracted so much attention on the roof of the greenhouse. We used to look there for an annual display of its charming lavender coloured flowers, but it has now, I believe, been removed. In the Temperate House, however, it is flowering freely, but it scarcely appeals to one there as it did of old when in the greenhouse. This lathyrus is a native of Chili, and is hardy in some parts of the country. Like many plants from the region it is not always a success, probably owing to a lack of atmospheric moisture during the summer months.

Eranthemum graciliflorum.

This distinct and uncommon species of eranthemum is now in flower in the T range. It is a native of Penang, and like most members of the genus requires the temperature of a stove or intermediate house. In common with many other eranthemums this forms an upright growing sparsely branched plant, but it can be flowered successfully when not more than eighteen inches high. The flowers, borne in a loose terminal cone-like head, are of a pleasing shade of lilac, the upper petal being freckled with a lighter tint.

Russelia Lemoinei.

This is a hybrid raised several years ago by M. Lemoine, of Nancy, between the well-known Russelia juncea (Weeping Mary of West Indian Gardens) and the more uncommon R. multiflora. If grown in a suspended pot the hybrid is so pendulous that the slender shoots form a fringe all round. The tubular-shaped flowers are about an inch long, of a carmine-red colour, and borne freely during the summer months. Now in flower in the T range.

K.

SAXIFRAGA PELTATA.

The value of the giant Californian saxifrage for grouping in open areas of woodland, the wild garden, or in any situation where it is desirable the plants should be able to take care of themselves and thrive, is not fully appreciated. Whether in flower or foliage the plant is strikingly picturesque, but only as a group; and a single plant in a border of other flowers conveys nothing to the artistic sense that is pleasing. The root stock is a running rhizome that branches freely, and is of the type of Iris or Acorus. The flowers appear early in spring, rising in the form of erect drumsticks, and eventually reaching $2\frac{1}{2}$ft. in height, when the inflorescence unfolds. This is a dome-shaped cluster of starry pink flowers in ropes five to six inches long, the dome half a foot across.

The leafage develops just before the flowers open and helps to relieve the bareness of the flower stems somewhat, and before the last flowers have developed it has hidden the stems entirely, and one now gets the perfect plant. The leafage is in huge mounds, the individuals two feet across, their margins elegantly crimped and lobed, and it becomes literally a study in glossy dark green and bronze throughout summer. Such a plant as this could be well used by waterside and in open spaces difficult to plant on account of excess of wet. Dells, copses, and combes are good situations for a plantation of Saxifraga peltata, and if shelter from the north and east can be given, its flowers will escape the disaster from frosts that is invariably their lot when growing in exposed and wind-swept areas.

G. B. MALLETT.

GARDENER'S INCUMBRANCES.

In his speech at the recent coming of age festival of the Royal Gardeners' Orphan Fund, the Duke of Bedford expressed his regret that so many who required the services of gardeners specified that there should be "no incumbrances" (page 386). Every gardener is aware that this means "no children," and the word to those with is little short of an insult, particularly at a time when the decrease in the birth-rate of the country is a matter for very serious consideration. Probably, if you asked the majority of employers of gardeners in the country whether the size of a man's family should be a drawback to a man seeking a situation, they would say "No," but when it comes to self, the case is different, and persons who do not think in a general way that the size of a man's family should handicap him when seeking a situation, would never think of engaging a gardener with half a dozen youngsters.

I have a case before me at the present moment of a gardener who recently applied for a situation, and was granted an interview. The man had left his last situation through no fault of his own, his character is good, and his credentials highly satisfactory. Everything looked promising until the fatal question was put, "How many children?" "Six." That settled it, and the unfortunate fellow is still out of place, and looking for an opening by which he can be done with private gardening for ever. Who can blame him, and if parents refuse to bring their children up to an occupation in which the liberty of the individual is so interfered with, is it surprising?

Incumbrances! What a hateful word this is to apply to the offspring of a man and woman; and what a thing it is for a man to have to realise that he is handicapped in the competition for employment through the mere fact that he has what should be regarded in the interests of the nation as a blessing—a family.

What family have you? This is an inevitable question that the gardener is asked when applying for a situation, and not infrequently it is the answer that spoils all his chances of securing the situation. Or, again, there are men to-day who are dissatisfied with their situations and would like to make a change, but a family has grown up about them, and the knowledge that these "incumbrances" would stand in the way of getting another place holds them back. Further, the advertisements under the heading of "Situations Vacant" are never very numerous in the horticultural Press, but one may frequently see the stipulation "no family preferred," or other words which convey the clear impression that it is of little use any man applying who is blessed with more than one or two children.

And what is the reason for the objection on part of employers to engage gardeners with families? One fails to find any real one, though several of a lame character might be given. The only feasible explanation that can be given is that the gardener's cottage is, generally speaking, on the premises, and the children cannot be shut up altogether, but they naturally want to live and move about, and have their being. Perhaps there is a possibility of them making a bit of noise, or the owner may object to seeing children about the place that belong to an employee, and so when a new gardener is being engaged, the provision is made that he must have no "incumbrances."

I wonder if this matter has been considered by the British Gardeners' Association as being one of the grievances which need remedying, but if not, the expression of his Grace the Duke of Bedford might be taken as the text for a discussion, because, apart from what may be said about it from the gardener's point of view, it is, as the Duke observed, a disastrous policy in every sense, and considering the decrease in the birth-rate, a national calamity that such a specification should be made. For long it has been a standing slur on gardeners as a class that a man should be considered unsuitable to fill a post for which he has every qualification, owing to the simple fact that he has what most right-minded people prize most amongst their possessions, i.e., children.

H.

HYDRANGEA PETIOLARIS.

The species of hydrangea are frequently represented in gardens by a couple of examples only, these being the common H. hortensis and the Japanese H. paniculata. These, again, are more seldom represented by type specimens than by their sterile varieties. There are, however, several other species, examples of which might well be given positions in both large and small gardens, and H. petiolaris is one of them.

A native of Japan, H. petiolaris has occupied a place in scientific collections, either under the above name or one of its several synonyms, for a considerable period, but it does not appear to have ever been widely grown. The botanist Maximowicz, called the same plant H. scandens, an appropriate name, had not Siebold and Zuccarini previously adopted that of H. petiolaris. It is of scandent habit, growing very much after the fashion of the common ivy, trailing about the ground, or attaching itself to a support, and ascending to a considerable height by means of aerial roots. The leaves are large, more or less cordate and acuminate, with serrate margins and long petioles. The larger ones are often six inches long and four inches wide. The inflorescences are in the form of large cymes six inches or so across, the centre flowers being numerous, cream-coloured, and fertile, whilst a few of the outer flowers are conspicuous by reason of their sterility and well-developed white bracts. The flowering period extends for some six or eight weeks during June and July.

For planting against a wall it is an excellent subject, as it attaches itself to the support naturally, and is of neat appearance. A much better method of culture to adopt, however, is to turn a large butt of a tree upside down, so that the roots stand out in an informal manner, and plant several plants round it. In a couple of years' time the branches will cover the roots and form an effective feature. Such an example may now be seen at Kew in the hydrangea collection.

A plant often confused with this is Schizophragma hydrangeoides. Hydrangea and schizophragma are closely allied, but quite distinct genera, and there is really no reason why the hydrangea should be sent out for the schizophragma, as is frequently the case. H. petiolaris is, however, a somewhat variable plant, and extreme forms look very different from the type.

W. Dallimore.

"CARNATIONS, PICOTEES, AND PINKS," will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

CATTLEYA HOUSE.—Plants that have recently passed out of flower, and that need repotting, should be kept under careful observation, so that they may be attended to as soon as root action commences. It is not advisable to repot plants at this season of the year, unless one is satisfied they have strong root action. The process of repotting is generally more or less distressing, even under the most favourable conditions, but when there is a prevalence of hot, dry weather, such as may be anticipated at this season of the year, the ill-effects are considerably minimised, and the plants become quickly re-established if first allowed to remain undisturbed until root action is observed. There are many species and hybrids now in an active state, and these must have every encouragement to assist development. The bright outside conditions of the past few weeks have been most beneficial, but every care is now necessary to avoid checks. With us the nights have been exceedingly cold, and more than an ordinary amount of artificial heat has been required to prevent the temperature falling below requirements. With a prevalence of cold outside conditions it is advisable to see that atmospheric moisture is reduced correspondingly with the fall of temperature after the sun declines. I consider there is nothing more likely to give checks to the young growths than excessive atmospheric moisture combined with a rapid fall of temperature.

AUTUMN-FLOWERING SPECIES, such as C. labiata, C. aurea, C. Gaskelliana, C. Rex, and C. Warscewiczi, are all now in a more or less forward state of growth. These should be placed in a position where they may have full benefit of the available light; this, combined with proper discretion in affording ventilation, will assist in ripening the growths as they develop. With this section of cattleyas, and the allied genera which flower before or immediately growth is completed, cannot produce satisfactory results unless the pseudo-bulbs become properly matured.

C. BOWRINGIANA, and the numerous hybrids that have been produced from it, are all producing new growths. These resent disturbance by repotting, and should not be disturbed more frequently than is absolutely necessary. They differ considerably in the period at which they produce their new roots; in several cases the new roots appear with the new growths, or when the latter has advanced a few inches, and in other cases the plants do not produce new roots until growth is completed, and, frequently, after flowering. Those that root with the new growths should have any attention necessary when the roots appear, but while there is sufficient room in the pots and the compost is good, any decayed or decaying compost should be carefully removed and a top dressing of fresh compost be given. We find a compost of two parts fibrous peat to one part broken oak or beech leaves, mixed with chopped sphagnum moss, suits these cattleyas well. Sufficient coarse sand or finely broken crocks should be added to keep the compost in an open and porous state. All newly-potted plants must be carefully shaded until the new roots have become re-established in the fresh compost.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

EVERGREEN BEGONIAS.—Since the introduction of so many beautiful forms of summer-flowering begonias the winter-flowering evergreen section seems to have fallen into disuse. Some of the varieties, however, such as B. fuchsioides and B. Weltoniensis, are among the most useful subjects for general decoration at a time when flowering plants are none too plentiful. They are most accommodating. A batch of plants may be brought on in a comparatively low temperature, and a few introduced into more heat at intervals, and by this means an almost continual succession of bloom can be maintained. I find it a good plan, after flowering, to keep the plants slightly drier at the roots for a short time, and then cut them back, shake out the soil, and repot, giving them a genial temperature. A mixture of three parts good loam and one part of leaf-mould, with silver sand, suits them well. Begonias will do well for as long a time in small pots as most things, but if large bushes are desired, liberal shifts must be given. The old favourite B. Weltoniensis looks well grown in baskets suspended from the roof of a warm conservatory, and some of the others are equally good for this purpose.

POT ROSES.—Some who grow tea-scented roses in pots for the production of early flowers think it best to keep the plants always under glass, but every experienced grower knows how much labour is necessary to keep the plants clean when they are so kept, and it is for this reason that many place them in the open air during the summer. I always do so as soon as the same class of roses come into flower in the open, the object being to ensure good roots, but the practice may, however, vary according to circumstances. It is more necessary to give plants that are expected to flower at Christmas and onwards a long rest in the summer, than it is those that are not expected to bloom until two or three months later. The cultivator who values his plants will give them the same attention during the summer as in the winter. Do not stand the plants on material that will reflect the full force of the sun, but, when convenient, the pots should be plunged to the rim in a bed of ashes quite in the open, away from walls or buildings, and then sun and air will harden up the growth. Pruning roses intended for the production of early flowers is also very important. If any are too large they should be dealt with at once, because if they are to be reduced in size it is necessary to cut back the old hard wood, which takes longer to start into growth than younger shoots. Small and young roses should only have just enough of the shoots reduced in length to ensure the resultant growth going to make a shapely plant. Plants that have fairly well filled the pots with roots should have weak liquid manure regularly, as this is necessary to keep up the fertility of the soil. Regular syringing with clear water will keep the roses free from insects, and two ounces of soft soap dissolved in a gallon of water, and syringed over the plants once a week will keep mildew away.

NICOTIANA SANDERÆ.—This makes a very beautiful subject for winter flowering in the greenhouse; not only does it flower continuously, but the colour is so much brighter than when flowers are produced outside in summer. If sown towards the end of June and given the same treatment as that usually given to cinerarias, and brought into the greenhouse towards the end of September, the result will be abundance of blooms all through the winter.—T. B. FIELD, Ashwellthorpe Hall Gardens.

THE FLOWER GARDEN.

LAWNS.—The recent pressure of bedding-out work has, in many cases, prevented close attention to lawns. Verges will need to be clipped, as nothing detracts so much from the good appearance of a place as untidy verges and walks. On most lawns there will now be a number of long grass "bents," which machines have failed to cut, and these should be cut off with a scythe and cleared away. Should the weather become hot and dry it may be desirable to remove the grass box from machines when mowing on light soils, as the cut grass will afford some help and shade to the roots, and, to some extent, prevent scorching. Watch freshly laid turf, and if it is suffering from drought a sprinkling of light soil may be brushed into any cavities made by shrinkage, and then given a good watering.

FLOWERING SHRUBS. — Pruning spring-flowering shrubs is best done immediately after flowering, especially in the case of weigelas, forsythias, philadelphuses, and all others that flower on the previous year's wood, the object being to induce as many strong, vigorous growths as possible, instead of a larger number of small weak ones that would not make such a pleasing display. Cut the old wood out to within a few eyes or buds of their base, and if the plants have become unduly crowded through past omissions, thin out rather freely, as growths of from two to five feet in length give a better effect than a large number of short ones. Berberis stenophylla and B. Darwini may be served in the same way. Mistakes are sometimes made by failing to take the centres out of young plants of broom, thus causing them to become too tall and leggy; these may with advantage be taken out immediately blooming is over, and before seed has time to mature. Freshly planted old, or any young rhododendrons and azaleas, should have all old flowers removed as soon as possible after flowering, for if allowed to remain the seed pods will be a severe strain, and prevent satisfactory growth being made.

NEW SHRUBS.—As so many new flowering trees and shrubs have been introduced during the past few years, one or two visits should be paid to good collections during the season with a view of selecting most suitable kinds for planting next autumn. From seeing them growing one gains a better idea of their suitability or otherwise for positions that might be devoted to them.

CLIPPED SHRUBS AND TREES.—It is rather too early yet to clip these, but attention should be paid them so that symmetry is maintained; should any vigorous growths appear these should be cut quite out, or they will unduly weaken other parts.

ROCK GARDEN.—This should have close attention. Many old flower stems will need to be removed, and weeds must be pulled out. Water when necessary, preferably late in the afternoon or early in the evening, to produce a humid atmosphere during the night. If ramondias and primulas have not seemed quite at home in the sites given them, mark other cavities or places for them. In some places the Wichuraiana roses rambling over and down the rocks form a very pleasing feature.

ROSE GARDEN.—Vigilant attention is very necessary now. Do not allow any growths to become damaged through lack of supports, especially on roses budded last year. If large blooms are needed disbudding must be practised. Remove all suckers that may appear, and search carefully for the rose maggot and caterpillars; dust with sulphur if mildew or rust appears, and should the weather be dry give copious supplies of water, especially on the lighter soils, and provide a good mulching of decayed manure. The roses may be further helped by using nitrate of soda or blood manure; the latter seems more helpful if dissolved in a tub of water overnight, and allowed to stand until morning, then diluted and applied. Towards the end of the month budding may be commenced; bud dwarfs as low down as possible, and insert the bud as quickly as possible after it is cut and the bark raised.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

WATERING AND MULCHING.—Examine carefully the roots of wall fruit trees, and if the soil is found too dry to be good for the trees give a thorough soaking, so that every particle of the soil is well moistened. Peach trees bearing good crops, and especially if the borders are well drained, will need heavy watering at least three times before the fruits riper. If the surface over and about the roots is hard slightly loosen it with a fork, so that the water can penetrate more freely; good soakings of liquid manure will greatly improve the growth and increase the size of the fruits, as also will good dressings of some patent manure well washed in with clear water. On sloping borders a basin-shaped depression should be formed round each tree to hold water; let each tree be given fully forty gallons of water in two applications, after which a good mulching with decayed farmyard manure will complete the work for the time being.

YOUNG TREES, and those bearing a light crop, should, if the growth is inclined to be too gross, not be watered for the present, but do not overlook those which may have been planted late, and those lifted and replanted last autumn.

STRAWBERRY PLANTS.—Beds which have been treated for the express purpose of raising young plants will, ere this, have thrown out strong healthy runners. These should be immediately pegged into sixty-sized pots filled with good loam. It may be thought that any soil will do for this work, but a sweet fresh mixture will be the better, so that the roots may from the first grow strongly. Pinch out the points of the runners just beyond the layered plant, and water when necessary. The variety Royal Sovereign, probably the most useful variety ever sent out, I always raise annually for filling a sunny border for our earliest outdoor supply. When so planted, at a distance of eighteen inches apart, the fruits do not rot in wet weather, as is the case with older plants whose leaves are strong and plentiful, and, further, the crop is generally ready to gather quite a fortnight before fruits are ripe on older plants. For fresh plantations the beds should be made ready as early as convenient; dig deeply and manure heavily, if the soil is light and porous, but with rich loam, and where the growth is likely to be too strong, manure should be given sparingly. Fruiting batches will be all the better for a heavy watering should the crop be heavy and the weather dry.

GRAFTS.—These should be carefully examined, and if the union is complete remove the binding and make the grafts secure against wind, otherwise they may be blown off. Tie them to stakes long enough to support the growth, the stakes being fastened to the stock. As the growth grows stronger remove all side shoots which may spring from the stock, except where the union has failed, when suitable shoots may be left and trained for budding, or probably grafting, next season. Trees horizontally trained, and which may have been cut back for the purpose of furnishing a fresh lot of young wood, should have the new growths made secure, and any not wanted may be removed. I have seen very fine fruits produced on old trees when the old tiers have been replaced by young wood, and especially in the case of pears.—H. MARKHAM, Wrotham Park Gardens.

Abutilons.—Abutilon igneum is far more suitable for pots in the conservatory than the taller growing varieties. It produces large flowers of a deep rich red colour in great profusion almost throughout the year. Like all the abutilons, it needs a great deal of nourishment in the form of rich soil, mulches of manure, and water; but if well supported it makes a good decorative plant for the conservatory, even in winter. Abutilons are all the better for being planted out in summer, gaining fresh vigour, given good soil, and not neglected in the matter of watering. Carefully lifted in October, before severe frosts occur, and sheltered in the greenhouse, the mass of buds formed during the autumn will open well, and make the plants highly decorative. If kept in pots throughout the summer they should receive two or three good shifts, in rich soil, and plenty of liquid manure when in flower. I find this abutilon does not root readily unless given a bell-glass. Cuttings may be put in now, or during any part of the summer, in light sandy soil, shading them from the sunshine, and keeping them moderately moist until rooted, when they should be potted separately and pinched back several times.—T. B. FIELD.

BATH GRAND ROSE SHOW and GENERAL SUMMER EXHIBITION.
SYDNEY GARDENS,
TUESDAY and WEDNESDAY, July 7 and 8.
[Please note dates.]
Classes for ROSES, Nurserymen and Amateurs, Bouquets, Cut Flowers, Sweet Peas, Strawberries, Plants, Tuberous Begonias, etc.
ENTRIES close July 3. For Prize Schedules, etc., apply E. R. F. PEARSON, Secretary. Office, 17, Argyle St., Bath.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.—TWENTIETH ANNUAL SHOW, SOPHIA GARDENS, CARDIFF, Wednesday and Thursday, July 22nd and 23rd, 1908.
Liberal Prizes for all sections.
Silver Plate, Cups, and Medals.
Every facility given to the Trade. Schedules free.
Mr. A. MAURICE BAILEY, Secretary,
24, Duke Street, Cardiff.

CROYDON ROSE AND HORTICULTURAL SHOW, WEDNESDAY, July 8, 1908.—Open classes, valuable Challenge Cup for Roses, with medals for amateurs; also good prizes for nurserymen, amateurs, and gardeners' group of plants, 70s., 50s., 30s., 15s., with medals and other good prizes. Full particulars of A. C. ROFFEY, Sec., 55, Church Road, Croydon.

HANLEY PARK, STAFFORDSHIRE.
July 1st and 2nd, 1908.
TWELFTH GREAT ANNUAL FLORAL FETE.
£650 IN PRIZES. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, value £10 10s. offered for
TRADE EXHIBIT"
(for particulars see page 10 in Schedule).
Valuable SPECIAL PRIZES offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.
Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

NORTH LONSDALE ROSE SOCIETY, ULVERSTON.
The 25th ANNUAL EXHIBITION in TODBUSK PARK, ULVERSTON, FRIDAY, July 17th, 1908, when an open Challenge Shield, 8 Challenge Cups, several Gold, Silver, and Bronze Medals, and Money Prizes, in all amounting £200, will be awarded for Roses, Sweet Peas, Violas, and Herbaceous Flowers.
Schedules Post Free on application to
F. J. HARRISON, Secretary.
[illegible], Ulverston.

POTTER'S BAR and DISTRICT AMATEUR ROSE SOCIETY.
(Affiliated to the National Rose Society.)
The Show will be held on THURSDAY, July 16th, 1908. Entries close July 9. Classes for Amateurs open to all England. Classes for Members, Nurserymen, and Others.
For Schedule and Entry Forms, apply to H. R. DARLINGTON, Park House, Potters Bar.

WOLVERHAMPTON.
GREAT FLORAL FETE.
July 7, 8, and 9, 1908.
£800 in Prizes. Entries close June 29.
Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

York Jubilee Fete and Gala.

PELARGONIUMS.

In concluding our report of the York Gala, from page 472, we have to state that although pelargoniums have long since ceased to be the great floral attraction at the York Gala, they still contribute a considerable and also an attractive section of the show. Premier place for a group of show pelargoniums arranged with ferns and foliage plants, was accorded to Mr. J. E. Skaife, Burton Lane, York, who had the best arrangement. Mr. W. Longstaff, Sydney Street, York, came second, and Mr. G. Lee, [illegible] Street, York, was third, but neither of the groups were of special merit.

The class for six specimen show pelargoniums was not up to the usual standard; Mr. G. Lee, Mr. J. C. Skaife, and Mr. F. Dean, [illegible] Cottage, Clifton, York, were placed in the order given.

Mr. W. F. Crowther, Wigginton Terrace, York, scored for six double-flowered pelargoniums with large and fairly well flowered specimens of Decoration, Boston Spa, Raspail Improved, King of Denmark, etc.; he was followed in order by Mr. J. W. Clarke, Skelton Street, Clifton; and Mr. Henry Pybus, Monckton Moor, Wormald Green, Leeds.

The class for three double-flowered ivy-leaved pelargoniums brought out a good competition, and all the exhibitors showed pyramidal specimens. Mr. J. R. Wedgwood, Burton Lane, York, led with Souv. de Chas. Turner, Fair Maid of Guernsey, and a light variety; Mr. H. Pybus came second, and Mr. H. Skaife third.

MISCELLANEOUS.

Groups of tuberous begonias were not of special merit, but the several exhibits made a bright display. Mr. F. Styan won first prize, Mr. Sydney Leetham came second, and Dr. P. W. Schmidt, Westfield, Fritton, York, was third. Mr. H. Mason, gardener to Mrs. Von Beverhoudt, Elvington Hall, York, had the best local group of herbaceous calceolarias, and showed a fairly good display. The best group of gloxinias was staged by Mrs. Craven; the best eight tuberous begonias, fine plants, by Mr. R. J. Foster; and Mr. S. Leetham led for eight calceolarias.

ILLUSTRATIONS.

In the present issue we give illustrations of the first and second prize rockwork exhibits, staged respectively by Messrs. J. Backhouse and Son, Lim., York, and Messrs. W. Artindale and Son, Sheffield. We also give an illustration of the first prize jubilee group staged by Mr. W. Holmes, Chesterfield.

NON-COMPETITIVE.

A bold and effective display of pæonies, pyrethrums, gaillardias, and delphiniums was set up by Messrs. Kelway and Son, Langport, Somerset, and among the double pyrethrums, which were very well shown, those that specially attracted our attention were Empress Queen, Souce, Virgo, Othello, Wega, Aphrodite, and Ivonne Cayeaux. The group of brilliant amaryllis set up by Messrs. Ker and Sons, Aigburth Nursery, Liverpool, was a great attraction. and rather a novel one for so late a date. The plants had been retarded by being kept dry early in the season. The pink varieties again attracted our attention, as these are so very distinct; The Mikado, Rosaflora, Unique, Monarch, and Masterpiece were very fine; while in deeper colours we made special note of President, The King, Lord Cromer, The Beacon, and The Premier, as fine in form and colour.

From Messrs. Sutton and Sons, Reading, came a pretty exhibit, made up of an excellent strain of streptocarpuses in the centre, with dishes and baskets of splendid melons around it; Hero of Lockinge, Ringleader, Perfection, and Sutton's Scarlet were the melons principally staged. With these subjects the Reading firm had dishes of fine early peas, some very fine tomatoes, and several varieties of the cucumbers for which they are famous. A large group of orchids was submitted by Messrs. Hugh Low and Co., Bush Hill Park, Enfield; it consisted of some fine examples of Cattleya Mendeli grouped with Cymbidium Lowianum, various odontoglossums, Cattleya Harrisoni, Lælia purpurata, Cypripedium niveum, and C. callosum Sanderæ. This firm had altogether a very extensive exhibit, and, in addition to orchids, they put up Hiawatha and Baby Rambler roses, blue and white hydrangeas, Metrosideros floribundus, Gerbera Jamesoni, Malmaison carnations in great variety, in pots, and a handsome lot of cut perpetual-flowering carnations representing all the leading varieties, and including a new yellow seedling of good colour.

A large and very handsome arrangement of choice foliage and flowering plants, from Messrs. Jas. Veitch and Sons, Lim., Chelsea, was a great attraction. The background of elegant palms was immediately fronted by specimens of Dracæna Goldiana, Alocasia crystallinum, Dracæna Godseffiana, Alocasia argyrea, Alpinia Sanderiana, etc. Along the middle were grand plants of Nepenthes Sir Wm. Thiselton Dyer, N. sanguinea, N. excelsa, N. Burkei excellens, and N. Amesiana, set up above the other things, and all with brilliant pitchers depending gracefully. The central foreground consisted of bright orchids, such as Lælia purpurata, L.-c. Canhamiana, Oncidium macranthum, Cattleya Mendeli, C. Mossiæ, and odontoglossums in variety. Other good things charmingly disposed were Abutilon Triumph, Kalanchoe flammea, Dracæna De Grootei, Elæocarpus reticulatus, with small pendant white flowers, the golden Richardia Elliottiana, and Medinilla magnifica.

Messrs. Clibrans, Altrincham, showed a group of choice hardy foliage shrubs, including a good assortment of vines, ivies, and maples. We noted Vitis Henryana, Hedera dentata aurea variegata, and the pretty silvery mottled Acer campestre marmorata, as very distinct and good.

A very large and bold group of well-grown caladiums, set up over a groundwork of maidenhair ferns, was capitally arranged by Messrs. J. Peed and Sons, West Norwood, London, S.E. The large plants of Madame J. R. Box, J. Peed, Silver Queen, Madame d'Halloy, Richard Bastin, Edith Luther, and Madame Pynaert were greatly admired, and drew forth many exclamations of admiration and wonderment from the visitors, both for their size and colour.

Messrs. Dicksons, Lim., Chester, put up an effective group of hardy cut flowers, in which pæonies predominated. P. Humei carnea was particularly fine, and of a delightful coral-pink, shading to cream. Some well-flowered spikes of the chaste Watsonia Ardernei and the uncommon little Lilium rubellum were noticeable. Several varieties of ixias, pyrethrums, and other useful things made up a very attractive exhibit. Considerable space was occupied by Messrs. Webb and Sons, Wordsley, Stourbridge, who staged gloxinias of excellent strain, embracing many lovely shades of colour. Interspersed between the plants were maidenhair ferns. Several varieties of tomatoes, cucumbers, and melons, including a fine fruit of Webb's new Masterpiece, occupied the front of the stage.

Pæonies occupied the greater portion of the space allotted to Messrs. R. H. Bath, Lim., The Floral Farms, Wisbech, conspicuous among the many varieties being Prince Victor, salmon-rose; Comte d'Osmont, creamy-white; and Mons. Pierre Dessert, glowing crimson. Several varieties of perpetual-flowering carnations occupied one end of the exhibit, vases of delphiniums completing the background.

Messrs. Richard Smith and Co., Lim., Worcester, staged hardy flowers in considerable variety, the exhibit containing a number of choice things. Fine spikes of delphiniums and various pæonies were conspicuous, as also were several vases of Campanula media calycanthema in delightful colours. The same firm set up a bold group of miscellaneous flowering and foliage plants, comprising Malmaison and other carnations, hydrangeas, petunias, and a few trained specimens of clematises. These bright subjects were arranged in mounds over a setting of dwarf shrubs, ferns, and dracænas, the whole arrangement being very artistic. Messrs. J. Backhouse and Sons, Lim., York, occupied a long stretch of ground-space with an exhibit of perpetual-flowering carnations, dwarf and standard roses of the polyantha class, hydrangeas, and the pretty little Azalea rosæflora. Tall palms and a few Crimson Rambler roses made up the background, while Nephrolepis todeaoides, Adiantum Farleyense, and other ferns finished off the front of a well-arranged group. Messrs. Wm. Artindale and Son, Nethergreen, Sheffield, staged violas in excellent style. Arranged in fan-shaped sprays of a dozen blooms, something like 100 varieties were to be seen, and among the many that appealed to us were Woodcock, white, edged mauve; Isolde, clear yellow; Seagull, white; and a pretty striped variety called James C. Erskine.

Messrs. Jarman and Co., Chard, Somerset, showed their beautiful race of new centaureas. In addition to the Bride, Bridegroom, and Bridesmaid, we noticed a clear yellow variety, aptly named Honeymoon. Zonal pelargoniums were also staged in large bunches, the varieties being of the best. A box of roses and a few carnations and sweet peas were other items on this stand. St. Brigid anemones were staged by Messrs. Reamsbottom and Co., Aldeburgh Nurseries, Geashill, Ireland. The blooms were scarcely so large as we have seen them, but the range of colour and beautiful shading and blending of these colours left little to be desired.

Messrs. W. and J. Brown, Stamford, staged hardy flowers, including fine spikes of eremuri, anchusas, a few liliums, and their yellow gaillardia Lady Rolleston.

Mr. H. N. Ellison, 57, Bull Street, West-Bromwich, put up a small interesting collection of ferns, among which were Gymnogramma Dobrodgense, G. Wettenhalliana, Hymenodium crinitum, and numerous other good things. Mr. John Forbes brought down from Hawick, Scotland, pot-grown phloxes in variety, also pentstemons, among which Crimson Gem, Marconi, The Paddocks, and Colonel Hope were extremely fine. Pansies and violas were also staged in Mr. Forbes' usual first-class manner. Two small hampers of the very brilliant bedding zonal pelargonium, named Black Vesuvius, were also shown. The blooms appear even more brilliant by reason of the sombre tint of the foliage, which, of course, is the variety's distinctive characteristic.

Messrs. W. Cutbush and Son, Highgate, London, put up a miscellaneous group of rambler and other decorative roses, carnations, and hippeastrums. A few tall crotons, dracænas, and palms rose above the level, and added much to the effect of the group. A very fine display of cut carnations was also staged by this firm, the leading varieties of the perpetual-flowering section being represented by large vases, in which the blooms were well arranged.

Needless to say the sweet peas staged by Mr. C. W. Breadmore, of Winchester, were remarkably fine. It is a long journey from Winchester to York, but Mr. Breadmore not only knows how to grow sweet peas, but how to pack them so that they travel well, an important point for exhibitors. St. George, George Herbert, Etta Dyke, The Marquis, King Alfonso, Prince of Asturias, Queen of Spain, Mrs. C. W. Breadmore, and Elsie Herbert were grandly staged. Carnations of the American type were well shown by Mr. C. F. Waters, Balcombe, Sussex, the fancies being very attractive, Glendale, white ground, heavily striped scarlet, and Fashion, lemon-yellow, edged and splashed with deep pink, being very beautiful. Among the selfs Victory, Winsor, and Pride of Exmouth were good, as also were the popular Enchantress, Britannia, and others.

Messrs. E. J. Batchelor and Sons, Station Square, Harrogate, put up a group of well-grown plants of nephrolepis, comprising the lovely N. todeaoides, N. elegantissima, N. Whitmannii, and N. Amerpohli, all of which are beautiful in the extreme. The exhibit of cut hardy perennials staged on the ground by Messrs. George Bunyard and Co., Lim., Maidstone, was rich in the variety of really useful subjects for border work it contained. Tiarella purpurea marmorata, an uncommon-looking flower of chocolate-brown, with golden anthers showing, is a plant of some merit, but the irises, pæonies, and inulas were, of course, more conspicuous. Pentstemon glabra was fine, and we were well pleased with the single Pæony Jupiter, a rich rose flower with golden anthers. A small water and bog garden was well arranged by the firm, Nymphæas Laydekeri and tuberosa occupying the improvised pond, which was surrounded by spiræas, irises, funkias, and many other moisture-loving plants.

Messrs. Charlesworth and Co., Heaton, Bradford, put up an attractive exhibit of choice orchids, all well displayed; Odontoglossum Phœbe splendens, Phalænopsis Rimestadiana, L.-c. Fascinator, Miltonia vexillaria Augusta Victoria, L.-c. Canhamiana King Edward VII., and Cattleya Mossiæ Wagneri were among the best examples. Mr. J. Sadler, Newbury, Berks, showed a small group of orchids that included a few good miltonias and Odontoglossum citrosmum. Messrs. Laxton Brothers, Bedford, contributed a fine lot of their strawberries and several baskets of fine peaches and nectarines. Mr. G. Yeld showed a few new seedling irises and hemerocallis, the former being very fine.

Messrs. James Backhouse, and Son, Lim., York, arranged an extensive group of deciduous and evergreen trees and shrubs outside the tents. In fact the exhibit was really a series of small groups with narrow walks between. Rhododendrons, acers, and conifers were well represented, with here and there standards of Cytisus Andreanus, golden privet, etc.

Messrs. Kent and Brydon, Darlington, set up a group of clipped box and yew trees representing all manner of quaint figures. The group was backed up by some excellent copper beeches. Topiary work exemplifies in a remarkable manner the patience of which the gardener is capable, for the specimens seen at exhibitions represent years of patient toil. Ornamental shrubs of more natural character were also well shown.

Royal Horticultural Society.

On Tuesday, June 23, there was again a very fine display at the Royal Horticultural Hall, hardy flowers being abundantly staged.

A beautiful lot of Spanish irises, set up in large bunches of each variety, was displayed by Messrs. Dobbie and Co., Rothesay, and afforded a good opportunity of comparing varieties. Thunderbolt, Czar Peter, Raphael, Belle chinoise, Soliel d'Or, Surbiton, Longfellow, Beauty, Leander, L'Innocence, and King of the Blues make up a fine set. Three fine new sweet peas, i.e., The King (A.M.), Dobbies' Mid-Blue (A.M.), and Mrs. Andrew Ireland were shown by the Rothesay firm. Messrs. William Bull and Sons, King's Road, Chelsea, set up a very bright lot of Spanish irises, in bunches of a variety.

Mr. Amos Perry, Enfield, put up a beautiful and delightfully cool exhibit of hardy flowers that included two grand banks of delphiniums in various rich shades of blue and violet. In the centre was a sheaf of Eremurus hybridus, a pink variety from E. Bungei and E. robustus, and in front of these was a group of liliums, such as L. colchicum, L. Browni, L. auratum, L. speciosum, etc., but the great feature of the exhibit was the pool of water lilies edged with funkias, Richardia Rehmanni, and hardy ferns.

Mr. James Douglas, Great Bookham, Surrey, contributed a large and interesting group of pinks, all growing in pots, and flowering with great freedom. We were specially struck with the merits of Snowdrift, a grand white, and such charming laced varieties as Bookham Gem, exquisitely laced with rich crimson; Beauty, Ascot, Gertrude, Mrs. Pomeroy, Tweeddale, Rosina, Ethel, and Fairy. A very big group of brightly-coloured crotons was set up on one long table by Messrs. H. B. May and Sons, Edmonton, and the well-grown plants attracted a great deal of attention; Prince of Wales, Achievement, Albert Truffaut, Florence, Neston, Chelsoni, Mooreanus, and Duke of Buccleuch were all particularly good. Messrs. W. Cutbush and Son, Highgate, were represented by a very fine lot of Malmaison and perpetual carnations in great variety, and by a group of Coleus Cordelia, the lovely spiræa Queen Alexandra, and the golden calceolaria Decorator.

Messrs. Wm. Paul and Son, Waltham Cross, put up a group of their new roses, and showed each variety in quantity. Refulgence, a bright scarlet hybrid sweet briar, was the most effective variety; it has large semi-double flowers, and apparently blooms with the utmost freedom; Dora, a pink H.T.; Elaine, a white H.T., Hugo Roller, a yellow and red tea rose of great beauty; Margaret, a pink H.T., and Albatross, a full white H.T., were others of great merit. A batch of brilliant crimson Scotch heather, Erica cinerea coccinea, was submitted by Mr. H. White, Sunningdale Nurseries, Windlesham. Messrs. H. Cannell and Sons, Swanley, had some very fine gloxinias.

Pæonies and delphiniums, as arranged by Messrs. T. S. Ware, Lim., Feltham, made up a bold and attractive group, the tall spike of the latter towering above the big pæony blooms; Duchess of Sutherland, Mdlle. Juliette Dessert, Eugene Verdier, Mons. Dupont, and L'Admirable were the best of the pæonies. Sedums in great variety made up an interesting exhibit from the Guildford Hardy Plant Nursery Company. Mr. George Mount, Canterbury, had a fine lot of roses. Messrs. W. and J. Brown, Peterborough, set up bunches of garden roses in variety.

Malmaison and perpetual carnations were largely and well shown by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, the former, especially Mrs. Trelawney and Maggie Hodgson, attracting even more attention than the perpetual varieties; this firm also had a few roses. A magnificent group of pæonies, containing a grand selection of varieties, was put up by Messrs. James Veitch and Sons, Chelsea; in the centre of the exhibit was a group of yellow eremuri spikes, representing E. Warei and E. Bungei. With these flowers were some fine campanulas.

The gloxinias displayed by Messrs. James Veitch and Sons, Chelsea, were a fine and brilliant feature of the show, and the method of showing batches of a variety and colour is an excellent one. With these finely grown and beautifully coloured flowers, representing a very fine strain, were some newer cannas, Richardia Elliottiana, Kalanchoe flammea, K. Kewensis, and Lobelia tenuior. The Chelsea firm also exhibited a big lot of beautiful Spanish irises, a selection of popular annuals, and the yellow Begonia Col. Laussedat (A.M.), a bedding variety. Messrs. Bakers, Wolverhampton, put up a bold group of aquilegias, poppies, pyrethrums, hemerocallis, and other useful and effective hardy flowers. Messrs. R. Wallace and Co. had a handsome lot of liliums, delphiniums, irises, Anchusa italica Dropmore var., and a lovely lot of heucheras that included some very beautiful and graceful varieties of these elegant flowers. Mr. W. J. Godfrey, Exmouth, showed delphiniums, the beautiful Solanum Wendlandianum, freely flowered, and a batch of handsome pelargoniums, such as Marjorie Brooks, Dairymaid, and Lady Decia.

Mr. F. W. Smith, gardener to G. Ferguson, Esq., Weybridge, submitted some splendid delphiniums, showing the result of careful cross-fertilisation and selection; Mr. Smith's pale cream and white varieties, and Orchioides, cream with brown centre, were greatly admired for their distinctness. Cambyses, a medium blue with white eye, was one of the finest of a fine and interesting set. Messrs. Kelway and Sons, Langport, Somerset, contributed a big exhibit of brilliant pæonies, pyrethrums, and delphiniums, the latter being remarkable for their free branching habit. From the Cottage Society, Garden City, Letchworth, came a contribution of pæonies, campanulas, [illegible] geraniums, etc., from the cottage gardens. Mons. A. Truffaut, Versailles, exhibited several fine anthuriums of the Andreanum type, and among these Pres. Liger, a crimson-scarlet, gained an A.M.

A very beautiful set of hardy flowers [illegible] included Spanish irises, gladioli, [illegible] irises, delphiniums, water lilies, [illegible] and pæonies, was well set up by [illegible] Barr and Sons, King Street, Covent Garden. Messrs. W. Spooner and Son, Hounslow, [illegible] up a very pretty group of roses. Mr. [illegible]ston, gardener to Dr. H. A. Martin, [illegible] brought up splendid examples [illegible] shaded hydrangeas. Messrs. J. Laing [illegible] Sons, Forest Hill, sent a group of [illegible] Messrs. Paul and Son, Cheshunt, showed a very fine group of pæonies. Little bunches of Madame Rousseau, [illegible] Marie d'Hour, etc.; single, as well as [illegible] varieties were shown. The Messrs. [illegible] and Son also showed roses well, [illegible] single yellow Buttercup proving a [illegible] traction; Starlight, Marquise [illegible]

Richmond, and W. A. Richardson, were also good. Messrs. B. R. Cant and Sons, Colchester, showed some lovely new roses, including Souv. de Stella Gray, Hugo Roller, Warrior, Richmond, Betty, Lady Roberts, and the vivid Etoile de France. Mr. R. Neal, Wandsworth, sent a few sweet peas. Messrs. J. Peed and Son, West Norwood.

ORCHID COMMITTEE.

Dendrobium clavatum was the feature of a small group of orchids exhibited by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, and round this were forms of Cattleya Mossiæ and C. Mendeli, with a few odontoglossums. Messrs. Stanley and Co., Southgate, N., exhibited a selection of varieties of Cattleya Mossiæ, with a few varieties of C. Mendeli and C. Acklandiæ. C. Mossiæ Heather Bell, C. M. Thompsoni, C. M. triumphans, and the deep-hued C. M. Duke of Marlborough were all very good forms.

Some interesting orchids came from the Burford Lodge collection, Mr. White setting up Epidendrum virens (A.M.), Bulbophyllum fusco-purpureum (B.C.), Eulophia nuda (B.C.), and the light orange-yellow Dendrobium Jerdonianum (A.M.). Messrs. Charlesworth and Co., Heaton, Bradford, showed a group of beautiful orchids that contained Lælio-cattleya Canhamiana albens, L.-c. Fascinator, Odontoglossum Williamsianum, O. Ossulstoni, Promenæa citrina, Lycaste tetragona, Phalænopsis Lindeni (B.C.), etc.

Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, Kent, submitted a group of odontoglossums in which forms of O. Queen Alexandra were notable, with O. [illegible], finely coloured; O. Leo, O. Urania, O. Crawshayanum, and O. Astræa. Mr. Hopkins, gardener to F. Wellesley, Esq., Westfield, Woking, showed two fine forms of Cattleya Mendeli, named C. M. Majestica and C. M. Venus; the latter had a broad pale area on the lip.

Mr. Mertens, Mount St. Amand, Ghent, showed a few beautiful, but unnamed odontoglossums. Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham, exhibited the large broad-petalled Odontoglossum crispum Princess of Wales (A.M.). Mr. G. W. Bird, Manor House, West Wickham, showed Odontioda Wickhamensis (A.M.), a small rosy flower with brown spottings. Thunia Marshalliana was well shown by Mr. H. J. Elwes, F.R.S., Colesbourne, Gloucester, who sent eight specimens

FRUIT AND VEGETABLE COMMITTEE.

From a collection of potatoes planted in the open in Cornwall, on February 3, Messrs. Dobbie and Co., Rothesay, brought up a beautiful set of very clean, fine new tubers. The leading varieties were Sharpe's Victor, Sharpe's Express, Sir John Llewelyn, Mile-[illegible] Early, Midlothian Early, Eureka, Southern Queen, Alpha, Radium, and Beauty of Hebron. The set of radishes from Rothesay caused a good deal of comment, as many of the large varieties are more popular on the Continent than with us, but the Olive and long-pointed forms were good. Some well-grown grapes were exhibited by Mr. Weston, of Eastwell Park Gardens, Ashford, Kent; the bunches of Black Hamburgh were finely berried and, for the most part, well coloured; Muscat of Alexandria, good clusters of Foster's Seedling and Gros Maroc were also shown, there being fourteen bunches in all. Big cauliflowers, fine cos lettuces, Early [illegible] carrots, and Oxheart cabbages, all grown under the French system, were exhibited by Messrs. Jas. Veitch and Sons, Chelsea. Australian apples, fine in quality, fresh, plump, and juicy, were shown from the Government Experimental Farm, Bathurst, New South Wales, Australia.

CERTIFICATES AND AWARDS.

First-class Certificate. — Odontoglossum Princess of Wales, from Mr. H. Ballantine, gardener to Baron Schroder, The Dell, Egham.

Award of Merit. — Stokesia cyanea alba, from Mr. Amos Perry, Enfield; Delphinium [illegible], from Mr. T. W. Smith, gardener to [illegible] Ferguson, Esq., Weybridge; rose Re[illegible], from Messrs. Wm. Paul and Son, Cheshunt; sweet peas The King and Dobbies' Mid-Blue, from Messrs. Dobbie and Co., Rothesay; Erica cinerea pygmæa and Campanula Raddiana, from Mr. G. Reuthe, Keston, Kent; anthurium Pres. Viger, from Mr. A. Truffaut, Versailles; Kniphofia goldelse, from Messrs. R. Wallace and Co., Colchester; Eschscholtzia Mikado, from Mr. W. H. Gardiner, Mill Street, St. Osyth; begonia Colonel Laussedal, and Eremurus Bungei magnifica, from Messrs. Jas. Veitch and Sons, Chelsea; Dendrobium Jerdonianum, and Epidendrum virens, from Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; and Odontioda Wickhamensis, from Mr. G. W. Bird.

MEDALS.

Silver-gilt Flora.—Messrs. H. B. May and Sons, Edmonton; Mr. Amos Perry, Enfield; Messrs. Jas. Veitch and Sons, Chelsea.

Silver-gilt Banksian.—Messrs. W. Cutbush and Son, Highgate; Messrs. R. Wallace and Co., Colchester.

Silver Flora.—Mr. G. Mount, Canterbury; Messrs. Paul and Son, Cheshunt; Mr. G. Reuthe, Keston; Mr. De Barri Crawshay, Sevenoaks; Messrs. Charlesworth and Co., Bradford.

Silver Knightian.—Mr. Weston, Eastwell Park Gardens, Ashford; Government Experimental Farm, Bathurst, New South Wales; Messrs. Dobbie and Co., Rothesay.

Silver Banksian.—Messrs. Barr and Sons, Covent Garden; Messrs. Bakers, Wolverhampton; Messrs. W. and J. Brown, Peterborough; Messrs. H. Cannell and Sons, Swanley; Messrs. B. R. Cant and Sons, Colchester; Mr. W. J. Godfrey, Exmouth; Messrs. Dobbie and Co., Rothesay (irises); Messrs. J. Kelway and Son, Langport; Messrs. J. Laing and Sons, Forest Hill; Messrs. Stanley and Co., Southgate; Messrs. H. Low and Co., Enfield.

Bronze Banksian.—Messrs. W. Spooner and Son, Hounslow.

Franco-British Exhibition.

In the fine music hall at the Franco-British Exhibition, a very handsome flower show was held on Wednesday, June 24. A schedule of prizes was prepared, but there were very few competitors, the show being composed almost wholly of trade displays. Some attempt at effect had been made, and, so far as the stage end was concerned, this was nicely carried out, and the central cross walk was also prettily finished. Besides the groups inside, there were a few displays outside, round the building.

Judging commenced about an hour later than the time fixed, but no one seemed to complain. It was also somewhat late before the awards were made known, but, no doubt, there will be an improvement in this direction on future occasions.

COMPETITIVE.

The gold medal offered as first prize for three dozen roses, three blooms of each, was won by Messrs. G. and W. H. Burch, Peterborough, with very clean, fair-sized flowers; Messrs. D. Prior and Sons, Colchester, came second, and Mr. G. Mount, Canterbury, third; there was no French competitor. First prize for twelve blooms each of Frau Karl Druschki and Caroline Testout was easily won by Messrs. D. Prior and Sons, Colchester.

In the open class for vegetables, arranged on a space of 20ft. by 5ft., open to French and British competitors, Mr. E. Beckett, V.M.H., Aldenham House Gardens, was a good first with a splendid display of finely-grown material, and a very varied selection. In the amateurs' class, Mr. Beckett was the only competitor, and again he had a fine lot. In the class for twelve kinds of vegetables, Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, was the only exhibitor, and he had a fine display of Webb's specialities.

FRENCH EXHIBITS.

Mons. Chas. Maron, Brunoy, France, showed a group of cattleya and lælia hybrids; L.-c. callistoglossa, L.-c. Canhamiana, and L.-c. Martinetti were the best plants. The

Thousands of Pounds Thrown Away.

Spend Sixpence in buying Vi-Cocoa, and Medicine will be found unnecessary.

The proper assimilation of the food they eat is of paramount importance to every man, woman, and child.

Dr. Tibbles' Vi-Cocoa taken regularly at breakfast and supper will do more to assure this than any medicine ever invented.

For Vi-Cocoa is not only self-digesting in itself, it also assists in the digestion of other foods.

Though thousands of pounds are thrown away every year on drugs they cannot replenish the system after the daily wasting of tissues. But Vi-Cocoa, which is neither a medicine nor a mere thirst-assuager, will do this when taken regularly.

Dr. Tibbles' Vi-Cocoa can be obtained everywhere for the small sum of sixpence per packet.

WEST'S PATENT GARDEN SUNDRIES have been invented during 25 years of practical experience in horticultural sundries. That by the better cultivation of plants and the pleasure by which gardens are kept in order their expense is doubly repaid. From Seedsmen. Samples and Large Illustrated Catalogue post free. C. E. WEST, Higham Hill, London, N.E.

carnations from the Carnation Cottage establishment, Rue des Bois, Rueil, were not up to English standards, either in form or colouring; nearly all the flowers had broken centres and burst calyces.

Messrs. Millet et Fils, Bourg en Reine, showed a large exhibit of strawberries, representing some sixty odd varieties. A lot of the fruits were still carrying the sulphur used to dispel mildew. None of the fruits were up to British standards, but the display was interesting, because of the many old varieties it contained.

M. G. Compoint, Rue de Landy, St. Ouen, sent a few peaches and nectarines and some very fine asparagus.

TRADE DISPLAYS.

Messrs. Dobbie and Co., Rothesay, contributed a beautiful display of very fine sweet peas that included such good novelties as Clara Curtis, The King, Mrs. A. Ireland, Agnes Eckford, The Marquis, Rosie Adams, Menie Christie, etc. With these were some exquisite sprays of show violas and stands of beautifully-marked pansies, as well as a fine set of splendid new potatoes. Messrs. J. Cheal and Sons, Crawley, Sussex, put up a rockwork display filled with alpine flowers, and flanked by sweet peas, roses, and their new and lovely pink lupin, Lupinus polyphyllus roseus. On the stage the central position was filled by Messrs. G. Bunyard and Co., Maidstone, who had a background of fruit trees in pots, and a foreground of pæonies, delphiniums, and sweet peas. One corner of the stage—a big one—was filled with noble and graceful ferns, set up finely by Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton; cyatheas, davallias, maidenhair ferns, and the newer nephrolepises, were in fine form. The opposite corner was occupied by Messrs. H. B. May and Sons, Edmonton, who had a delightful exhibit of beautifully-grown ferns, in which davallias and the new plumose nephrolepises were the leading features.

The whole of the front of the stage was filled in with pillar, rambling, and garden roses, many in pots as growing, and others cut and in boxes and vases; these were all from Mr. G. Mount, Canterbury. Pæonies and roses, the latter in great variety, made up a fine group from Messrs. Paul and Son, Cheshunt. A group of carnations was set up in a very elegant manner by Messrs. Hugh Low and Co., Bush Hill Park, Enfield, the Malmaison and perpetual varieties, combining with ferns and green moss to make up a charming group. The same firm had a small group of greenhouse plants. The fruit trees in pots, chiefly Peregrine, Dagmar, Dr. Hogg, Royal George peaches, and Early Rivers, Dryden, and Stanwick Elruge nectarines, all splendidly cropped, made a grand and tempting display from Messrs. T. Rivers and Son, Sawbridgeworth. The plums and cherries were also good, and the display was greatly admired. A group of fine double begonias was set up by Messrs. J. Laing and Sons, Forest Hill. Messrs. J. Peed and Son, West Norwood, sent gloxinias in variety. Mr. W. J. Unwin, Histon, Cambridge, had an elegant display of sweet peas that contained Sutton's Queen, Constance Oliver, Etta Dyke, Miss Drayson, Mrs. Hardcastle Sykes, etc.

Near the centre of the hall there were two good exhibits of orchids. One, from Mr. W. P. Bound, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, was non-competitive. It was finely arranged, odontoglossums and oncidium spikes arching out from the central pyramid over the lælio-cattleyas, rare odontoglossums, masdevallias, and choice cypripediums. The other exhibit was the only competitive one of orchids, and was from Messrs. Armstrong and Brown, Tunbridge Wells, who had a fine Cœlogyne Dayana in the centre, and a front group of Cypripedium bellatulum and C. niveum, flanked by pretty odontoglossums. The base of the central pyramid was filled with Cattleya gigas and odontoglossums.

Miss Hemus, Holdfast Hall, Upton-on-Severn, showed the charming Evelyn Hemus and other sweet peas. Mr. C. W. Breadmore, Winchester, had two groups of fine sweet peas, one each side of the gangway; Mrs. C. W. Breadmore, Prince of Asturias, Dora Breadmore, and Elsie Herbert were very good. A glorious bank of gorgeous cannas, set up by Messrs. H. Cannell and Sons, Swanley, Kent, was one of the great attractions. We have never seen the Swanley firm stage these splendid plants so well. Mr. C. F. Waters, Balcombe, Sussex, had one of his excellent displays of perpetual and Malmaison carnations.

A very beautiful exhibit of sweet peas, arranged in arches, bunches, and vases, was put up by Messrs. E. W. King and Co., Coggeshall, and it was very much admired by the visitors. Mrs. W. King, Evelyn Hemus, Mrs. Hardcastle Sykes, and Phenomenal were all very finely shown. Mr. S. Mortimer, Farnham, Surrey, sent some big vases of good perpetual carnations, and boxes of his fine cucumbers and tomatoes. Messrs. R. H. Bath, Wisbech, set up carnations and roses, and Messrs. G. Jackman and Son, Woking, put up a very fragrant display of roses. Mr. John Barrow, Oadby, Leicester, had a charming exhibit of garden roses, chiefly tea and hybrid tea varieties, all in large bunches; a pretty exhibit. Messrs. S. Bide and Sons, Farnham, had a small group of roses, in which Queen of Spain figured largely. Mr. Tomlinson, gardener to R. Hoffman, Esq., Tower House, Streatham, contributed a group of bold caladiums.

Messrs. T. S. Ware, Lim., Feltham, contributed a grand lot of double tuberous begonias,but one variety—Lady Cromer—stood out far beyond all the other good things. It has immense blooms, slightly frilled, and of the loveliest pink hue—one of the finest begonias ever raised. Mons. Truffaut, Versailles, sent anthuriums. Messrs. G. and A. Clarke, Lim., Dover, showed sweet peas extensively. Messrs. Kelway and Son, Langport, had a quantity of pæonies and delphiniums outside the hall, and Messrs. R. H. Bath, Lim., Wisbech, were extensive exhibitors of pæonies, irises, etc. Messrs. Bunyard and Co., Maidstone, contributed hardy flowers, and Messrs. Jarman and Co., Chard, set up sweet peas, carnations, and roses. Messrs. G. Jackman and Son, Woking, and Messrs. R. Wallace and Co., Colchester, transferred their groups from Westminster. Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, showed cut sprays of ornamental trees and shrubs.

Messrs. Webb and Sons, Stourbridge, had a very attractive exhibit of their special varieties of peas, potatoes, melons, tomatoes, cucumbers, beet, etc., all admirably set up. The Syndicate des Maraichers de en Region, Paris, sent examples of their produce, the short, thick cucumbers, the seakale beet, capsicum, long turnips, endives, and fine cauliflowers attracting a good deal of attention by reason of their novelty. Messrs. Sutton and Sons had a very interesting exhibit of new potatoes, their special varieties.

Messrs. G. and A. Clarke, Dover, set up a big lot of hardy flowers, setting up a most imposing display outside the hall. Messrs. Barr and Sons' pigmy trees were a great attraction, and their pæonies and irises were very bright. Messrs. T. S. Ware, Lim., Mr. W. H. Page, Messrs. Carter Page and Co., London Wall, and Messrs. Fromow and Sons, Chiswick, all had outside displays, the latter showing two handsome groups of Japanese maples.

MEDALS.

Gold.—Sir J. Colman, Bart., Messrs. H. B. May and Sons; Messrs. Dobbie and Co.; Messrs. J. Hill and Sons; Messrs. T. Rivers and Son; Messrs. W. Fromow and Sons; Messrs. Hugh Low and Co.; Messrs. Millett et Fils; Messrs. E. Webb and Sons.

Silver-gilt.—Mr. C. F. Waters; Messrs. R. H. Bath, Lim.; Mr. W. H. Page; Mr. S. Mortimer; Messrs. G. Bunyard and Co.; Mr. C. Page; Messrs. Paul and Son; Messrs. R. Wallace and Co.; Mr. C. W. Breadmore; Messrs. E. W. King and Co.; Mons. Omere Decugas; Messrs. R. H. Bath, Lim.; Messrs. G. Jackman and Sons.

Silver. — Messrs. Hoffman; Misses Kipping; Messrs. J. Cheal and Sons; Mr. J. Harwood; Messrs. J. Kelway and Sons; Mr. J. Barrow; Messrs. Jarman and Co.; Messrs. Sutton and Sons; Hon. Vicary Gibbs; Messrs. Carter Page and Co.; Messrs. J. Laing and Sons; South Australian Government; Mr. M. G. Anderson.

Royal Botanic Society.

JUNE 17.

In place of the great horticultural exhibition which has usually been held in June, a monthly show was held on the above date. The weather was wet and dull in the morning, but finer in the afternoon, and there was a goodly number of visitors.

A large exhibit, remarkable for its excellent quality, was contributed by Messrs. Kelway and Son, Langport, Somerset, and consisted chiefly of herbaceous pæonies, two varieties receiving distinction. These were Fair Maid, a single variety, of a lovely shade of soft pink, the petals slightly incurving, which received a first-class certificate, and Langport Belle, a light pink double form, to which an Award of Merit was made (gold medal).

Messrs. Barr and Sons staged a representative group of hardy flowers, including irises and all the choicer kinds of herbaceous plants with their pigmy trees (large gold medal).

A handsome group of pot and cut roses was exhibited by Messrs. Paul and Son, Cheshunt, who also contributed a group of pæonies. (large gold medal).

Perpetual-flowering carnations were well shown by Mr. S. Mortimer, of Farnham, who had White Perfection, Robert Craig, President, and other leading varieties in good form (gold medal).

Messrs. T. S. Ware ('02), Lim., Feltham, had a most effective display of pæonies, delphiniums, carnations, and begonias (gold medal).

New and choice roses were shown by Messrs. Wm. Paul and Son, Waltham Cross, and these included several boxes of the hybrid fragrant briar Refulgence (A.M.), and a handsome basket of the beautiful seedling tea rose, Hugo Roller (F.C.C.), (silver-gilt medal).

Messrs. John Peed and Sons, West Norwood, staged herbaceous and alpine plants (silver-gilt medal).

A special large gold medal was awarded to Messrs. John Waterer and Sons, Bagshot, for their large and varied collection of rhododendrons.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held on June 15, at the Horticultural Hall, Vincent Square, S.W., Mr. Charles H. Curtis in the chair. Four new members were elected. The amount of sick pay was £55 5s. since the last meeting. A member over seventy years of age was put on the benevolent fund, subject to Rule 19, Clause 3. The committee hope that members will do all they can to induce young gardeners to join the society, and so make provision for themselves during sickness and in old age.

ONE PENNY WEEKLY, by post 1½d.

FARM AND GARDEN

THE DAIRY—POULTRY—PIGS—LIVE STOCK—ALLOTMENTS—MARKET GARDENING, etc.

This week's issue (June 27) contains the following:

HOW TO MAKE BUTTER.
CLEAN MILK.
FATTENING STOCK ON GRASS.
YOUNG HORSES IN SUMMER.
HAY-MAKING.
CHICKENS FLAGGING.
FORCING THE MOULT.
BUSH FRUITS.
MARKET GARDENING NOTES.
ARTIFICIAL SWARMS OF BEES.
COWS APPROACHING CALVING.
THE SPARROW NUISANCE.
THE LAYING COMPETITION.

SOLD BY ALL NEWSAGENTS.

OFFICES: 148 and 149, ALDERSGATE STREET, London.

ANSWERS TO CORRESPONDENTS.

INSECTS ON CHERRIES.—L. A., Ealing: We hope to answer your query in our next issue; we have just succeeded in hatching out the eggs.

GRUB-EATEN STRAWBERRIES.—T. H., Kingston: It is always advisable to give a strawberry plantation a good dressing of soot directly after it has been hoed and cleaned preparatory to laying down the straw or long litter that is to keep the strawberry fruits from being splashed with dirt during rain. Unless this is done there is almost certain to be trouble from grubs of various kinds: if the material used for mulching is too old, then the trouble is increased. The fruits sent have been eaten by slugs and by the smaller millepedes, and also, perhaps, by the chafer beetles, but the former are answerable for the chief damage. By means of birch twigs, etc., keep the fruits as far from the ground as possible, and remove and burn all damaged fruits and pests as the work proceeds.

EVERGREEN BERBERIS.—E. L., Twyford: In addition to Berberis Darwini, B. stenophylla, and B. aquifolia, which you already have, there are several other useful evergreen kinds of berberis, notably B. buxifolia (or dulcis), B. congesta Lakiodes, B. japonica, B. Wallichiana, B. empetrifolia, and the handsome but rather tender B. nepalensis.

STRAWBERRY - GROWING DISTRICTS.—S. P. C., Fenny Compton: The chief strawberry-growing districts are those of Southampton in Hampshire, St. Mary Cray in Kent, Wisbech in Cambridgeshire, Evesham in Worcestershire, South Cornwall, Bedford, near Alnwick in Northumberland, and Blairgowrie. All round the Metropolis, in Herts, Essex, Surrey, and Middlesex strawberries are largely grown, but there is not the concentration of effort here as in the districts named.

ROSES FOR CHRISTMAS.—J. A., Gravesend: Please let us know what conveniences you have for forcing.

GRUBS IN CHERRIES.—E. A. A., Farnham: It is not a fact that every English cherry fruit contains a grub, though in districts where various moths and insects are abundant, some of the fruits may be found to contain a grub. But when the cherry trees are well cared for the luscious fruits are perfectly clean. It is not infrequently stated that every blackberry fruit contains a grub. But this is incorrect, though a modest percentage of wild fruits are found to have [illegible] tenant. Good culture and winter spraying are the best means of preventing the occurrence of grubs in apples, cherries, and other fruits.

CULINARY PEAS.—T. T., Birmingham: We are having the matter dealt with, and will report in due course.

DAFFODILS.—W. H. C., Leicester: Lift the bulbs carefully, so that as little damage as possible is done to roots and leaves, and then lay the bulbs in rows in ashes on light soil, give them a watering, and let them remain until the foliage dies away. If this is done the bulbs will not suffer appreciably, as the leaves have practically fulfilled their functions, and the removal of the daffodils will permit you to have a summer display. The bulbs should be laid in in an open position.

ONIONS FAILING.—A. S. J., Purley: The cause of failure is an attack of the Onion Fly, a pest that does a great deal of harm in some districts, especially on light soils. The flies appear towards the end of April or early in May, and soon commence to lay their eggs on the onion leaves, near the ground. As the grubs hatch out they eat their way into the base of the onion bulb, and cause collapse. When full fed, the maggots enter the soil, and pass into the chrysalis state, and in about fifteen days the perfect fly emerges ready to soon commence egg-laying, and provide another brood capable of doing as much damage as the first. All you can do at present is to water the bed carefully (not through a rose) with water, to which paraffin has been added at the rate of a half-pint to three gallons of water. At the end of the season, when the ground is bare, spread a layer of gas lime all over the surface, and when this has laid for about three weeks, thoroughly trench the ground, burying the top few inches of soil in the bottom of the trench.

ACALYPHA HISPIDA.—If cuttings are put in at once, and the plants grown steadily along in the stove, they will form useful material by about Michaelmas. Use a compost of peat and loam with a little dried cow manure and coarse sand. Keep each plant to one stem. Feeding will be necessary when the plants have filled their flowering pots with roots. Syringe freely until the tassels begin to form, then cease. Keep a sharp lookout for thrips and mealy bug; the former disfigure the foliage, and the latter spoil the inflorescences.

TAR ON HOT-WATER PIPES. — J. A., Gravesend. Either by the use of turpentine or paraffin, the tar may be removed from the hot-water pipes without any very great trouble, but great care will be necessary to prevent any of the cleansing material entering the vine border. Place a tin trough under the portion of pipe that is being cleaned, to catch the paraffin, which, of course, can be used over and over again. Ventilate as freely as possible while the work is being done. A piece of strong canvas makes good rubbing material.

ROSES. ROSES. ROSES.

1 Year, 10/6 post free; 6 months, 5/6 post free; to Foreign Countries, 15/- per annum.

*** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

PICKLING ONIONS.—J. W. C., Berkhamsted: Make a good sowing at once on a piece of good open ground. Rake down the surface and tread it firmly, then draw very shallow drills, mere scratches, nine to twelve inches apart, and in these sow the seeds rather thickly. Choose a silver-skinned variety. No thinning will be necessary, but hoeing and weeding must be attended to. This crop very quickly matures.

NAMES OF PLANTS.

W. H. C., Swansea.—The Great Butterfly Orchis, Habenaria chlorantha.

J. F. W., Penryn.—Anthericum ramosum, or graminifolium as it is often called.

S. M. C., Rutland.—The shrub appears to be Piptanthus nepalensis; the other plant is Sedum acre.

G. S. H., Hampton.—1, Pinus pinea; 2, Wellingtonia gigantea; 3, Acalphya Macafeeana; 4, Iresine Herbsti.

M. E. M., Worcester.—1, Prunus Pissardi; 2, Eucalyptus globulus; 3, Oncidium flexuosum; 4, Catananche cærulea.

R. S., Chelsfield. — 1, Thalictrum adiantifolium; 2, Catalpa bignonioides; 3, Colutea arborescens; 4, Orchis maculata.

A. B., Hastings.—1, Diervilla rosea nana aurea; 2, Diervilla rosea; 3, Tradescantia virginica; 4, not recognised; 5, Sequoia sempervirens; 6, Abies pungens glauca.

C. M., North Wales.—The specimens had suffered considerably in the wet moss, in a close tin; 5 is Davallia hirta cristata; and 6, Adiantum diaphanum. The others appear to be garden varieties of Rock Roses, but we were unable to distinguish them.

FORTHCOMING ENGAGEMENTS.

The Editor is always glad to receive intimation of exhibitions, and copies of schedules.

MONDAY, June 29.—Isle of Wight Rose Show at Ryde.

TUESDAY, June 30.—Canterbury Rose Show.
Southampton Horticultural Society's Rose Show; two days.

WEDNESDAY, July 1.—Newcastle Summer Show; three days.
Hanley Floral Fete; two days.
Farnham Rose Show.
Sutton Rose Show.
Reading Rose Show.
Royal Society of Arts Meeting.

FRIDAY, July 3.—National Rose Society, Regent's Park.

OBITUARY.

We regret to record the death, on the 15th inst., of Mr. William Neild, head of the horticultural department of the Agricultural College at Holmes Chapel. Mr. Neild was an able lecturer and writer on gardening subjects, and was held in high estimation.

FIVE CROPS IN A YEAR.

To grow Five Crops in a Year from the same soil sounds like an impossibility, but it has been successfully done for over a century by French Gardeners. How their methods may be profitably imitated in England is demonstrated in "THE FRENCH GARDEN," just published by the "Daily Mail," price 6d. At all newsagents and booksellers, or post free from the Publisher, 29, Bouverie Street, E.C., 7½d.

A Complete Guide for Planting and Culture of Hardy Plants and Flowers, including Bulbs and Tubers.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

Some Features of the Work:—

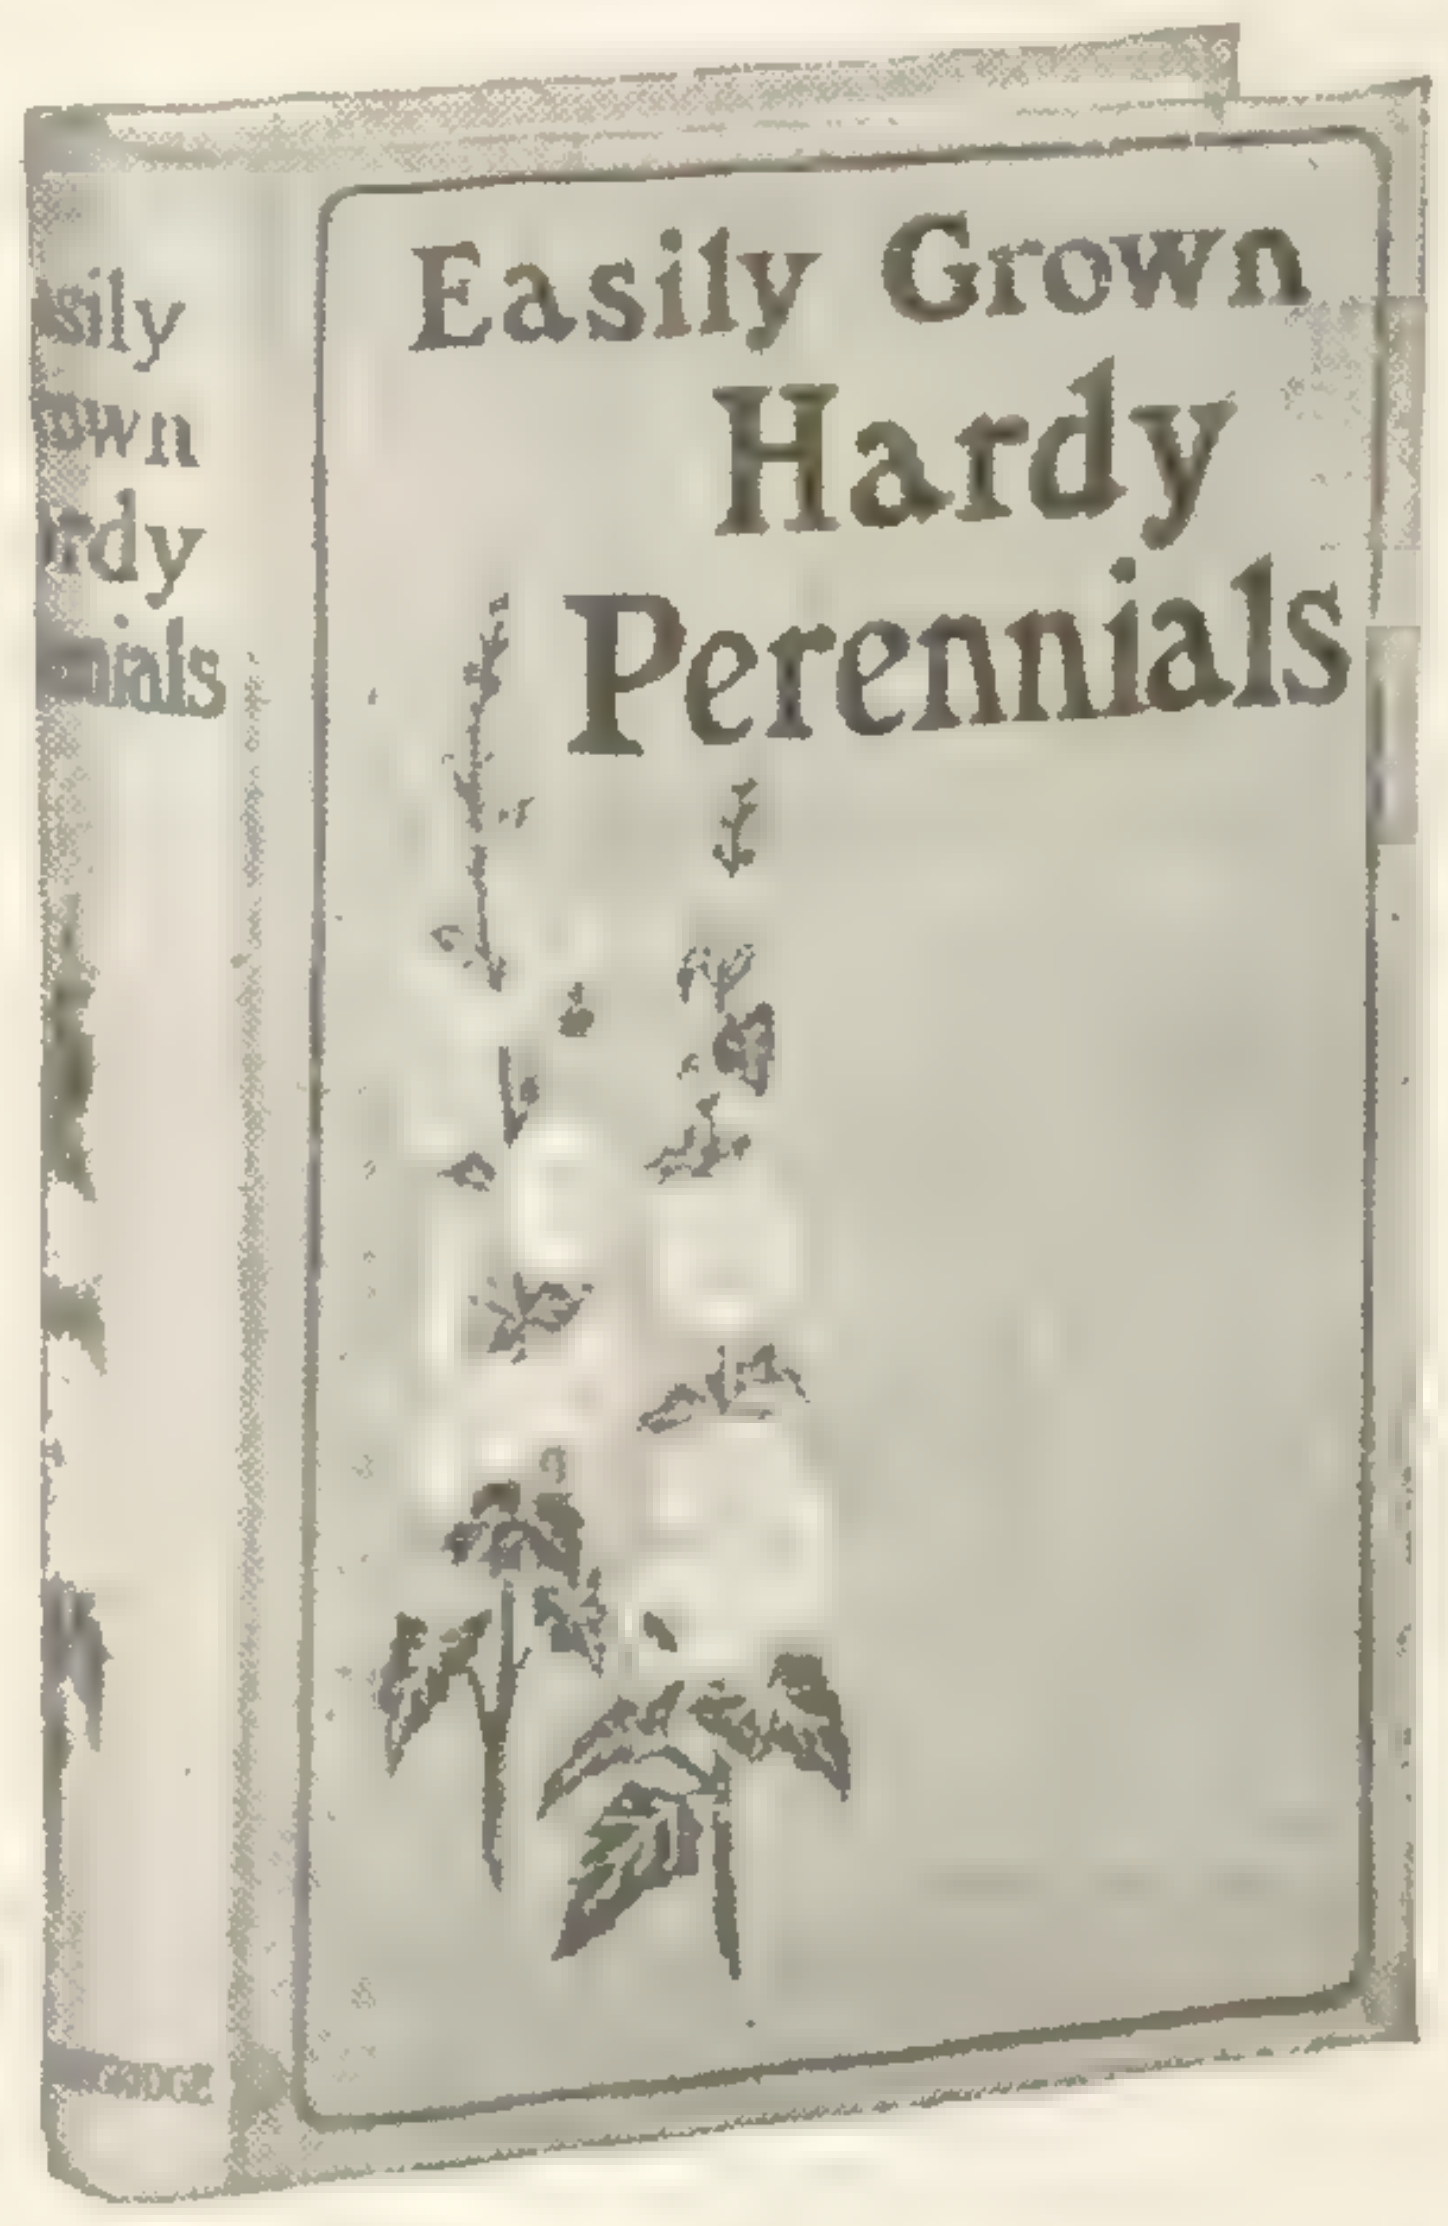
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.— Gives the botanical or generic name of each genus of plants described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

The Culture of Flowers, Fruit, Vegetables, etc., at a Glance.

Bound in Cloth. **PRICE 3/6 NET.** By post **3s. 10d.** 454 Pages.

TWELFTH EDITION—With 22 pp. Addenda.

ENCYCLOPÆDIA OF GARDENING.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Looking Round.

At the present moment our gardens are in the full flush of their summer glory, and favoured by bright, warm weather we are able to thoroughly enjoy their varied charms The leaves of the trees are still full of sap, and have that lush green hue so refreshing to the eyes, while affording a shade that is extremely grateful in these hot days. In the long borders we have surpassed the grand displays of hardy flowers so beloved by our grand-parents, and there are great masses of glowing colours, as well as virgin whiteness and soft colours, provided by the flowers, all making up a garden picture the like of which is hardly to be found outside the United Kingdom. We have digged and manured, planted and sowed, watered and mulched, weeded and hoed, tied and staked, and now, in great part, we can enjoy the result of our labours. A fine sense of satisfaction steals over us, and we feel, if we do not say, "Behold it was very good." Whether we own a ducal establishment or cultivate a homely little plot, whether we are employers or employed, this sense of satisfaction and also of gratitude to Nature, to the raiser and collector, may be ours, if good work has been done, and at the right time. But, after the enjoyment of contemplation, let us look around and see whether there is room for improvement in some of the many details that must have attention to ensure successful results. The garden has usually some lessons of more or less importance to teach; some plant needs a sunnier or a shadier position; something was sown or planted too early or too late; colours do not harmonise or contrast exactly as we had hoped; or it may be we have not so closely approached perfection in arrangement for a long continued display as we could wish. Lucky, or perhaps unlucky, is the person whose garden has no lesson to teach, no suggestion of improvement to offer. But we of the craft are ever progressive; we understand the difficulties of soil and situation; we know something of the vagaries of plants, and know that we are not likely to have everything in perfection in our garden however strenuous may be our endeavour. But that knowledge does not prevent us from attempting to continually improve the garden of which we have charge, and "looking round" is one of the greatest helps. Having looked round our own garden and made note of errors and needed improvements for another season, the opportunity for "looking round" other gardens should be taken advantage of. Our pride may suffer in some cases, while in others we may give helpful hints as well as receive them. This is the time to visit public and private gardens, nurseries, and the like, and employers who love their gardens and appreciate the efforts of their gardeners should give the latter every reasonable encouragement for "looking round" gardens other than their own, resting assured that they themselves will be the gainers thereby. Gardens within a comparatively short distance should, as a matter of course, be taken advantage of for "looking round," as they will include many object lessons of a local character that can hardly fail to be of much value, and especially to those who have not been in the district a sufficient length of time to enable them to fully understand the climatic and soil condition peculiar thereto. But "looking round" should not be confined to neighbouring gardens. Those in distant parts of the country should be included in any comprehensive scheme of "looking round." There are in most cases difficulties of time, or of finance, or it may be of both, in including any considerable number of gardens that involve a long railway journey and several days' absence from home. But by taking advantage of the facilities that at this season of the year are afforded for travelling long distances, much may be done that has hitherto been regarded as impossible without an unduly heavy tax on financial resources or time. In the case of distant gardens it is advisable to arrange, as far as circumstances will permit, for "looking round" those enjoying some degree of fame for one or more distinct features, and especially such as are formed by subjects that are of special interest to those who purpose visiting them. There is also a still wider range of vision that might well be taken by those who are specially favoured; we refer to Continental gardens. Our insular prejudices are apt to blind us to the excellencies of the gardens in Germany, Belgium, France, and Italy, but a week or a fortnight spent in these countries would prove the benefit of "looking round," and though we should learn what to avoid at home, we should also learn what to imitate and improve upon. Fortunately most horticulturists whether concerned in private, public, or trade establishments, are willing to allow their fellow-craftsmen to inspect their displays at this season of the year, and as brother gardeners are every ready to discuss the merits or demerits of plants and methods, "looking round" is now, as ever, one of the best means of advancing horticultural education.

HON. M. STUART-GRAY.

The Hon. M. Stuart-Gray, whose fine seat is one of the most noteworthy of the homes of great Scottish families in the neighbourhood of Perth, takes so keen an interest in his beautiful gardens as to justify his being regarded as one of the foremost amateur horticulturists in Scotland. The gardens of Kinfauns Castle, as stated in the account of them which appears on another page, are remarkable for their splendidly-developed conifers and deciduous trees. But until the present owner succeeded to the Kinfauns estates whatever of interest there was in the gardens and grounds of the castle was associated more or less closely with the trees. The gardens had been neglected for a period of sixty years, and to have brought them into their present condition is an accomplishment of which the Hon. M. Stuart-Gray has good reason to be proud. Whether he is proud of what he has done we cannot say, but we know that he takes great pleasure in his gardens, and gives careful attention to any points that may arise with regard to their further improvement. Imbued with a great love for gardening, and possessing taste of a high order, he fully appreciated the importance of carrying out the improvements on the most advanced lines, and did not hesitate to obtain the advice of one of the leading landscape gardeners of the present day, and thus, as he mentioned to us, have the advantage of new ideas. Chief among the many improvements in the gardens of Kinfauns Castle has been the conversion of a stream running through the grounds into a beautiful bog garden, the formation and planting of extensive borders of hardy plants, and making provisions for the cultivation of lilies on an extensive scale. The fame which the charming gardens of Kinfauns Castle now enjoy was exemplified by the visit of some fifty or sixty members of the Dundee Horticultural Association a few days since.

National Rose Society's Exhibition, which was held on the 3rd inst. in the gardens of the Royal Botanic Society will be fully reported in our next issue, and the report will be accompanied by illustrations of the more important exhibits.

School Gardens in Surrey.—Under the direction of Mr. John Wright, V.M.H., the school gardens in the county of Surrey have developed wonderfully during the past few years. The size of the individual plots varies somewhat, while, in the several districts, the range of soil is from heavy clay to almost pure sand. As a rule, the juvenile gardeners show great keenness and interest in the work, but it is wonderful how that keenness is accentuated when the teacher takes more than a passing interest in this special subject. We had the opportunity of inspecting several sets of gardens recently in company with Mr. Horace J. Wright. We saw youngsters learning how to trench, thin out crops, and spray potatoes, and in other cases we saw plots where no weed was permitted to exist, and where broad beans, peas, carrots, turnips, runner and French beans, potatoes, and onions, and beet were all in perfect health. Soil counts for a good deal, and it is quite possible that in some districts the crops resulting are not commensurate with the care expended, but even then, if thorough work has been put in the instructors are satisfied. One set of school gardens attracted our special attention because order, cleanliness, and good culture were so obviously reflected in the excellence of the crops. This set was at the Whiteleaf Schools, Caterham, where the master, Mr. Waterson, with practically no technical knowledge, has encouraged the lads to follow up the general rules laid down for guidance, and his school gardens are worth going a long way to see, as they are a pattern for anyone who is contemplating good work of this character.

Challenge Cups at Edgware.—The Edgware and Little Stanmore Horticultural Society offers no fewer than six challenge cups for competition at its exhibition, to be held at Canons Park, Edgware, on Saturday, July 11. For traders there are a ten-guinea cup for roses and a similar one for sweet peas; and there are a cup open to all amateurs, cup for roses, a cup for local amateurs for roses, and one for sweet peas, and a cup for vegetables open to cottagers and allotment holders.

Holland House Show. — The Royal Horticultural Society's exhibition in the grounds of Holland House on Tuesday next will be specially reported in our issue of the 11th inst.

Wilton House, which was visited by the King and Queen a few days since, is one of the most interesting and beautiful seats in Wiltshire. The mansion is built on the site of the monastery which with the lands attached thereto was given by Henry VIII. to Sir William Herbert, the first Earl of Pembroke, and is of handsome elevation, the garden front being in the Italian style. Wilton House is remarkable for its marbles and pictures, and is rich in historical associations. The grounds are extensive and beautiful, contain many interesting trees of unique proportions, and include an Italian garden of tasteful design.

Sherwood Cup Competition at Holland House Show.—One of the great attractions of the show to be held at Holland House, Kensington, on July 7 and 8, will be the competition for the silver cup presented by Mr. N. N. Sherwood for the best twenty-four bunches of roses, with their own foliage, shown in vases, by amateurs. We may add that Lieut. Charles Godfrey's band will play during each afternoon, and the private gardens of Holland House will be open for inspection both days.

York Jubilee Fete and Gala.—In the present issue we give our readers two other illustrations of the grand Yorkshire Flower Show, and this time present pictures of the fine and bold groups of orchids arranged by Messrs. J. Cypher and Son, Cheltenham, and Messrs. J. W. Moore, Lim., Rawdon, Leeds, who were placed equal first, and not first and second, as we inadvertently stated on page 471. We also learn that besides the awards already announced the committee subsequently awarded a gold medal each to Messrs. Ker and Sons, Liverpool; Messrs. E. Webb and Sons, Stourbridge; Messrs. Sutton and Sons, Reading; and Messrs. J. Peed and Son, West Norwood.

National Sweet Pea Society.—Members of this society have recently received their tickets for the exhibition to be held in Vincent Square on July 24, and the one to be held in Dublin on August 5. The date of the London shown is somewhat late, and will, therefore, give the midland and northern members a good chance of competing successfully with the southerners. With the tickets there have been sent out the classification lists, which members are requested to fill up and return to the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, together with their answers to the eight questions set on the question-sheet. By such papers as these the interest of every member is sustained, and each has an opportunity of adding to the general knowledge of sweet peas and their cultivation. It was arranged that the members of this society should visit Messrs. Dobbies' seed farm, at Marks Tey, as soon as the sweet peas were in good bloom. Mr. Sherwood, senr., of Messrs. Hurst and Son, hearing from his neighbour Mr. Cuthbertson that the society was coming down to Essex, expressed a wish that the members should also visit his grounds. Arrangements are being made to visit both establishments at the end of next week. Those desirous of joining the party, and who have not already communicated with the hon. secretary ought to do so immediately, as the invitations are being posted to-day (July 4).

British Gardeners' Association Visit to Kew.—The members of the London Branch of the B.G.A. will meet at the main gates, Kew Green, on Saturday, July 4, at four p.m., whence the party will proceed to inspect the Royal Gardens. The arboretum will receive special attention. As a large number of members is expected it will be necessary to divide the party into sections when passing through the glass departments. Several well-known horticulturists will kindly act as leaders. All professional gardeners are invited to attend.

Flowers from Coombe Wood.—Messrs. J. Veitch and Sons very kindly send us a large gathering of flowers of trees and shrubs from their Coombe Wood nursery. The flowers are all more or less beautiful, and of special interest as showing that even at midsummer there are large numbers of trees and shrubs in bloom. The gathering includes weigelas, genistas, styrax, kalmias, escallonias, andromedas, and other kinds in great variety, the exquisitely beautiful Andromeda speciosa cassinæfolia being one of the most noteworthy of the many good things.

The Broom-Rapes form the subject of an interesting article in the "Journal of the Board of Agriculture" for June, accompanied by a coloured reproduction of Orobanche minor, the Lesser Broom-Rape, a species that is often plentiful enough among clover to form a pest. In some parts of Germany this parasite is so plentiful that it has received the name of Kleeteufee or Clover Devil. It is suggested that wherever the plant is seen it should be pulled up, and this may be done with ease, as the broom-rape readily separates from the clover root. When it occurs only in small patches it may be dug out and burnt. If allowed to come to maturity the seeds will be scattered broadcast in large quantities.

Prize-Giving Day at Swanley College.—On Tuesday, July 14, the Countess of Bective will distribute the prizes won by the successful students at the Horticultural College, Swanley. Sir John Cockburn, K.C.M.G., chairman of the governors, will preside, and the proceedings will commence at four p.m. Trains leave Victoria at 2.42 and Holborn Viaduct at 2.37.

Water Lilies at Kew.—During the recent bright and hot weather the pleasant places at the Royal Gardens, Kew, have been those where fine trees lend their grateful shade, or where the water produces such a cooling effect. In the tanks in the herbaceous garden, the end of the big lake, and the small pool by the side of the Cedar Avenue, the water lilies and other aquatics are now very beautiful. The nymphæas are the leading feature, and N. sulphurea, N. Leydekeri liliacea, and the Marliacea varieties, and the large nuphars, like N. polysepala, all lend character to the scene, and are in themselves very attractive and beautiful.

New Park for Norwood.—We learn that as the Lambeth Borough Council has added £1,000 to its previous grant of £4,000, and also as Sir E. Tritton has contributed £1,000, the London County Council will proceed to purchase a piece of land at Gipsy Hill and at once convert it into an open space. The total cost of the estate will be £15,000.

Some Gardens Round Perth—II.

KINFAUNS CASTLE, PERTH.

KINFAUNS CASTLE, the seat of the Hon. M. Stuart-Gray, holds a prominent place among the many important seats in the neighbourhood of Perth, both for its great natural attractions and for the extent, beauty, and high keeping of its gardens. Standing upon a broad terrace, high above the Tay, which here forms such a distinct feature of the landscape, the castle commands a prospect that could hardly have a superior in the United Kingdom; and as seen from the other side of the river forms a conspicuous landmark in its beautiful sylvan setting. As an illustration is given of this stately pile there is no occasion to dwell upon its architectural features, but it may be mentioned in passing that it was built in 1820 by the fifteenth Lord Gray, and that it occupies the site of the old castle. This last point is not without interest as illustrative of the great judgment that was so frequently shown in olden times in the selection of sites for mansions and other dwellings. Surrounding the castle are many fine trees, and on the flanks of Binn Hill, which rises at the back of the castle to a height of many hundred feet, are large breadths of woodland, and numerous specimen trees occupying positions where they were able to make unrestricted growth. At the summit is a tower, eighty feet high, which was built early in the last century by Lord Gray as an observatory, and affords from its top one of the most widely-extended prospects in the Perth district. Some part of the famous Kinnoull Hill is on the Kinfauns estate, and one of the former owners contributed his share to the replanting of that famous landmark.

The gardens, long famous for their finely developed trees, have had their charms and interest greatly enhanced by the present owner, who takes a keen interest in them as in all that relates to his fine possessions, and is not slow to give practical expression to any views he may hold with regard to their improvement. The richly-furnished pleasure grounds are of extreme beauty, particularly above the castle, where the lawns slope on either side down to a babbling brook, and, as elsewhere, contain many fine trees. This brook has been taken advantage of in the formation of a bog garden, wherein may be seen a selection of the finest moisture-loving plants at present in cultivation. The illustration given herewith will afford a good idea of this delightful feature, but it hardly does it justice, as the brilliant sunlight imposed a severe restriction in the selection of the point of view in the taking of the photograph, and the very strong shadows increased the difficulties in connection with the endeavour made to depict the garden and its characteristic vegetation. Higher up are beds and borders of hardy flowers, and in two or three beds were examples of the finest lilies, which were in so robust a state of health as to show that at Kinfauns the cultural requirements are well understood, and that they are so beautiful as to justify strenuous endeavours to grow them in the best possible manner. Still higher up the grounds are many other choice hardy herbaceous plants, growing and flowering in so satisfactory a manner as to prove to demonstration that much care and skill have been brought to bear upon them.

One of the chief glories of the gardens of Kinfauns Castle is formed by the coniferous and other trees, which comprise a large number of the choicest kinds in a high state of development, and deserve a much fuller notice than can now be given them. Flowering shrubs, arranged in groups and otherwise, contribute materially to the attractions of the grounds, and it may be mentioned as a point of some practical importance that the beautiful Buddleia variabilis Veitchi grows vigorously, and blooms profusely thus far north, as evidenced by the fine specimen in these gardens. Among the more noteworthy of the splendidly-developed coniferous trees are Abies Douglasi, Picea Lowi, Araucaria imbricata, Wellingtonia gigantea, Cedrus deodara, C. Libani, Cupressus Lawsoniana, the deciduous cypress, and various thuias. The illustration herewith of a few of the specimens affords an excellent idea of the fine growth of these trees. Chief among the deciduous trees are Turner's Oak (Quercus Turneri), one of the finest specimens in the country; the variegated English oak (Q. robur variegata), a handsome form remarkable for its bright leaf colouring; the Purple Beech (Fagus sylvatica purpurea), and the stately elms, sycamores, and common oaks, some of the latter being of great age.

A GROUP OF FINELY DEVELOPED CONIFEROUS TREES, KINFAUNS CASTLE.

VIEW IN BOG GARDEN, KINFAUNS CASTLE.

The kitchen and fruit gardens are extensive, and furnished with glass structures adapted to the requirements of an establishment of the highest class, and in the several houses there were many proofs of Mr. Farquharson's skill as a cultivator of both plants and fruits.

Seggieden.

Some two miles distant from Kinfauns Castle, in the direction of Dundee, is Seggieden, the charming residence of Mrs. Drummond Hay, with its large and interesting gardens. The mansion occupies a position within a short distance of the Tay, and in front is a geometric flower garden which in each recurring season is embellished with summer-flowering plants that thrive in the district, and produce a rich and tasteful display of colour. There is a tendency to strongly deprecate the use of tender bedders, but when used with taste and judgment, as at Seggieden, the pleasing display of colour produced forms a welcome contrast to the dark hues of the trees with which the gardens are furnished. As in other gardens round Perth there are many fine conifers, and two that are of much interest to those who have devoted any considerable share of their attention to arboriculture, are the examples of the variety of the Scots fir known as Pinus sylvestris hagnensis, which were raised from seed brought by Louden from the Continent, and given to the then owner of Seggieden, or his gardener, but probably to the latter. The trees have long since attained their full size, and the source whence they were derived has due weight in the appreciation shown them. There are also fine beeches, elms, and limes in the grounds, with good examples of some other deciduous kinds.

In a rather distant part of the grounds a large collection of flowering and ornamental-leaved shrubs was formed some years ago, and as they have attained to a considerable size they form a delightful feature. An illustration is given of one of the walks through this part of the grounds, with its border of shrubs on either side, and from this it will not be difficult to gather that the several kinds are in a flourishing condition, and large enough to display to advantage their distinctive

A WELL-FURNISHED SHRUBBERY IN THE GARDENS OF SEGGIEDEN.

characteristics. There are a few coniferous trees in association with the shrubs, and an illustration of the exceptionally fine specimens of Cupressus Lawsoniana erecta viridis is given herewith.

Just outside the pleasure grounds is a portion, about fifteen acres in extent, of one of the old orchards for which the Carse of Gowrie was at one time famous. As in the case of so many of the old orchards in England, the trees are much crowded, and, therefore, not in accordance with the more advanced views that obtain with regard to orchard management. The orchard comprises apples, pears, and plums, and a considerable proportion of the varieties represented are local, and in most seasons produce heavy crops. Last year, when over the greater part of the United Kingdom standard pear trees were practically barren, the trees in this orchard carried heavy crops, many of the branches resembling the proverbial "rope of onions."

Under glass a very interesting feature was formed by the large collection of Cape plants that had been collected and sent home by Colonel Drummond Hay, who has been on active service in South Africa for several years past. Another important feature is the cultivation of the choicer kinds of fruits, such as peaches and nectarines, in pots, in which, as in other departments, Mr. W. Blakley displays skill of a high order.

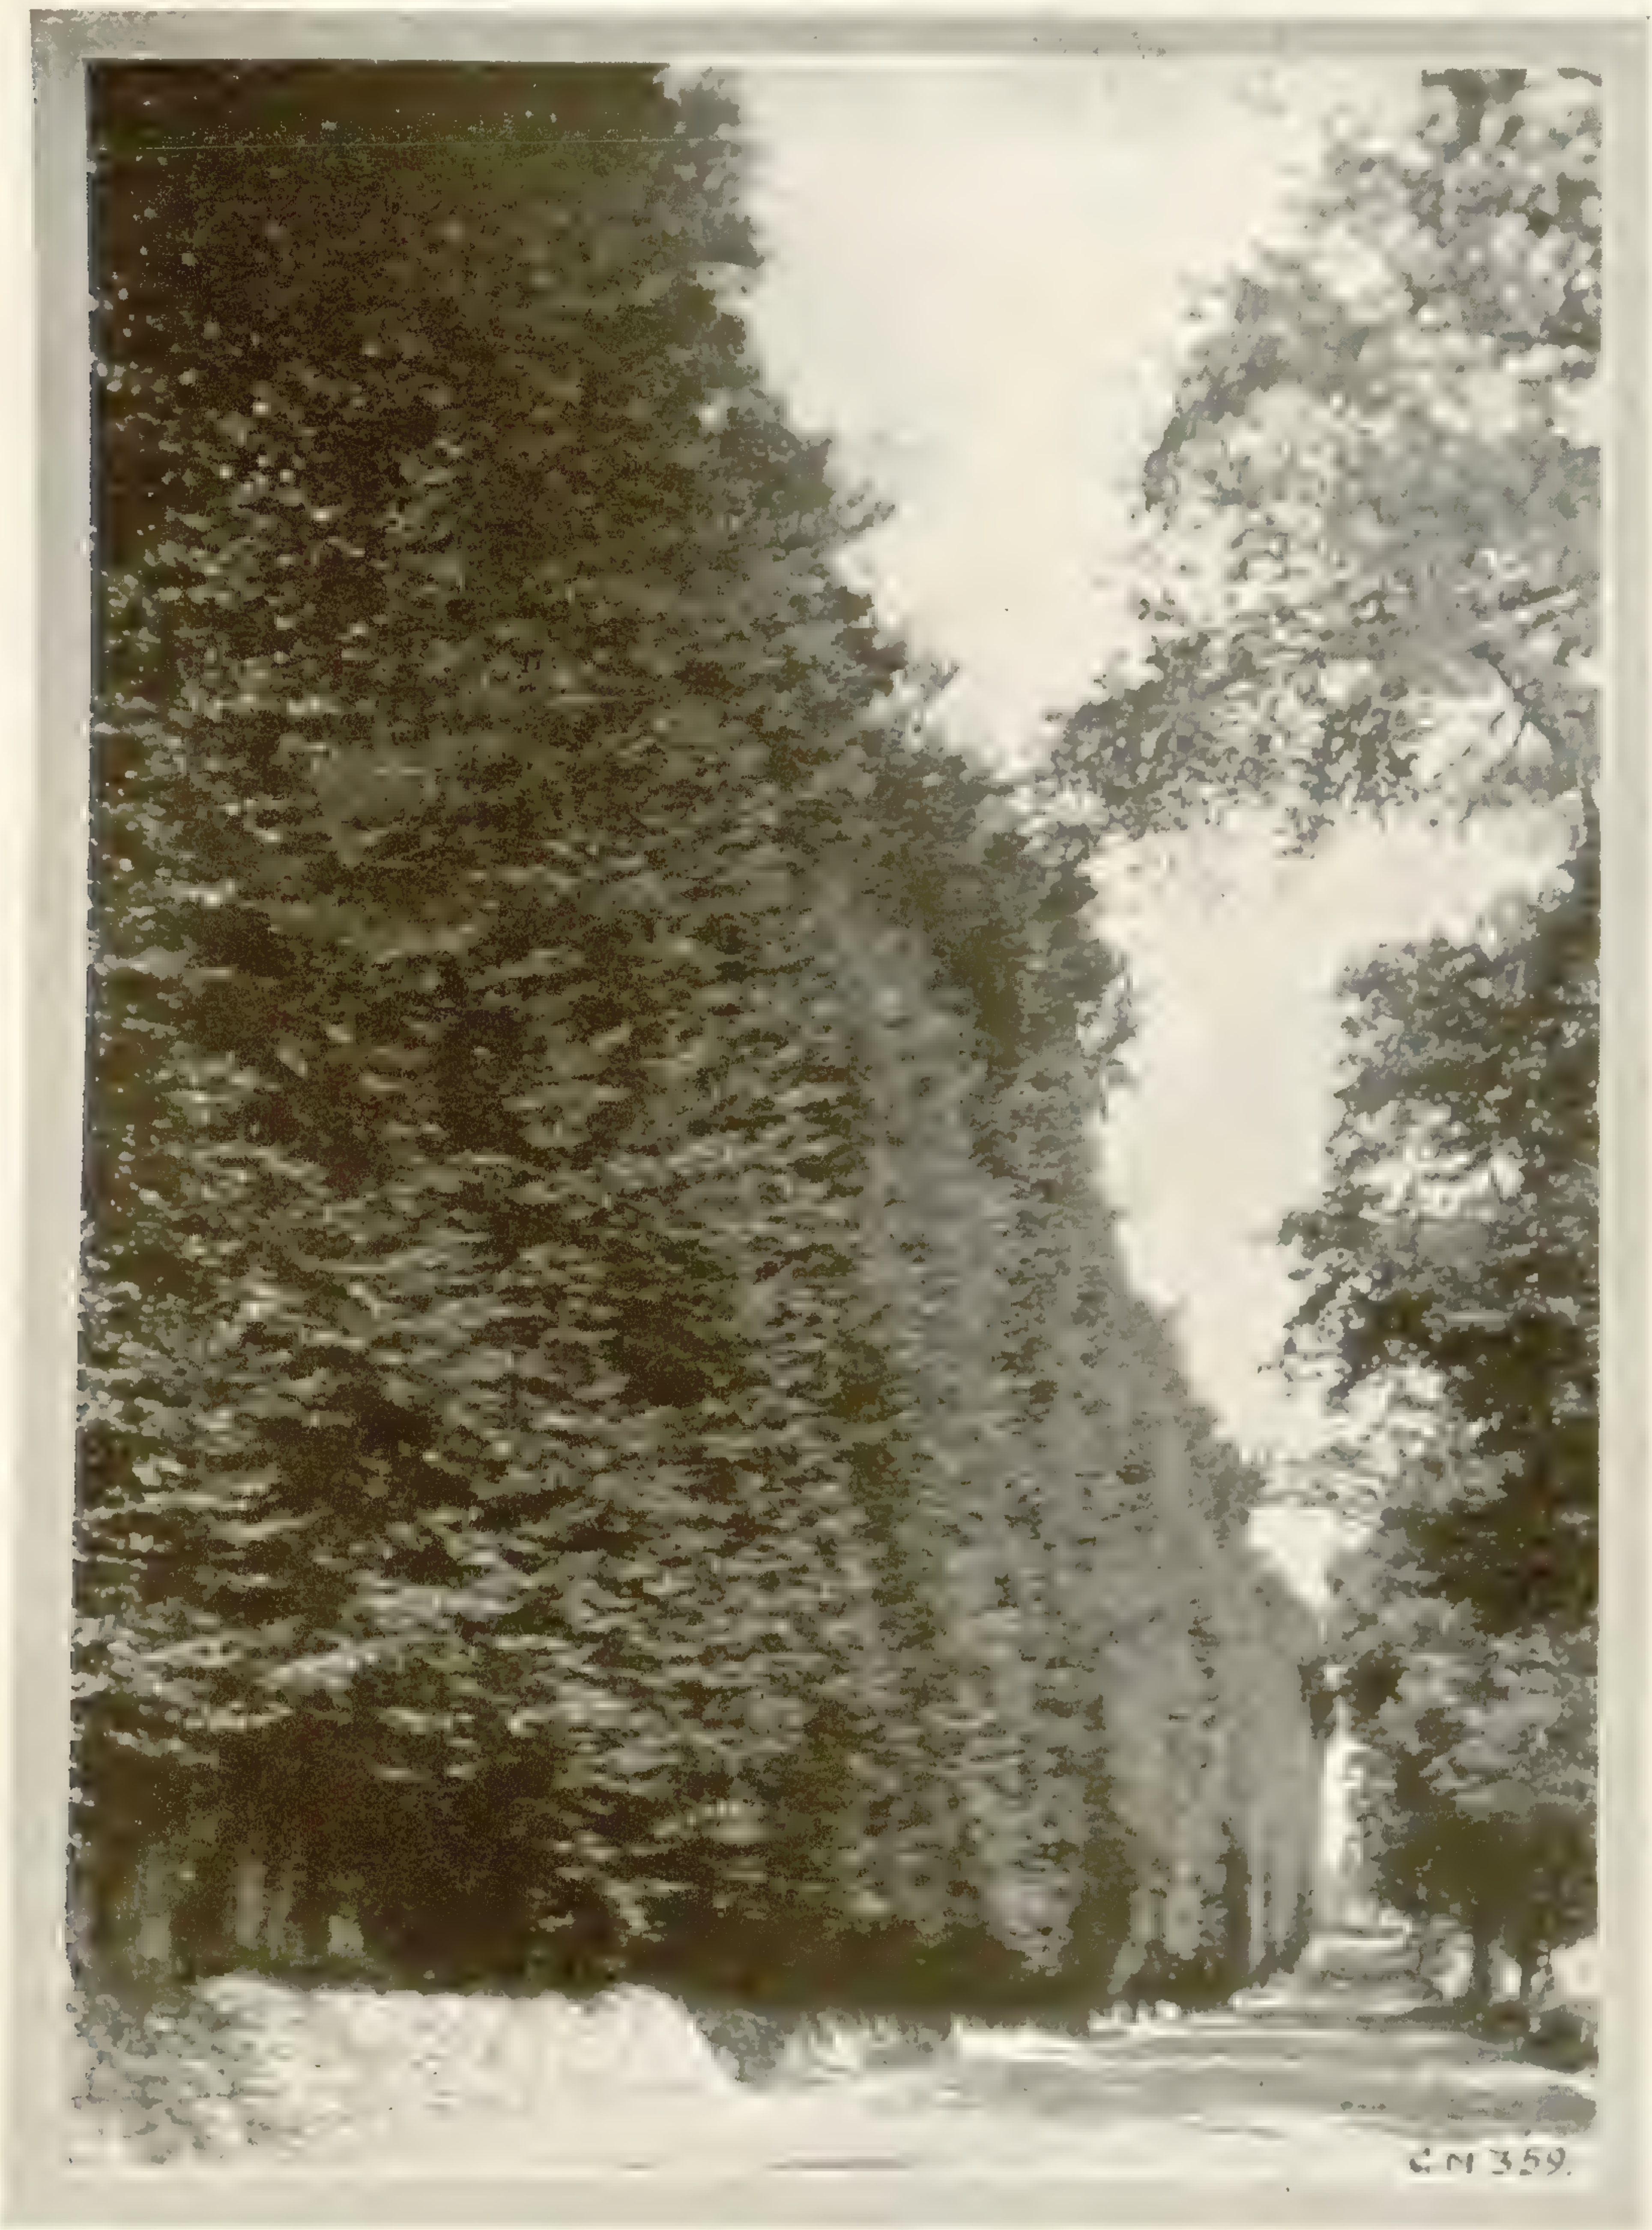
Murthly Castle.

Murthly Castle, one of the Scottish seats of W. S. Fothringham, Esq., has long been famous for its coniferous trees, and assuredly the fame is fully justified, for nowhere in the United Kingdom are they so strongly represented either in point of numbers or stature. Occupying a position on the south side of the river Tay about twelve miles north of Perth, and situate amid scenery of the most charming description, the castle and grounds have attractions altogether apart from those due to the liberal planting of the finest of the then available conifers, which was commenced in the first half of the last century.

The grounds of Murthly Castle contain fully six miles of grass walks and drives, and these were commenced by Sir John Drummond Stewart, who succeeded to the estates in 1827, and built the new castle. His successor, Sir W. S. Drummond Stewart, continued the work of making drives, and proceeded to beautify the grounds by planting on a large scale the finest of the coniferous trees that were then introduced to Great Britain. The Douglas fir would appear to have been regarded with much favour by Sir William and some of his successors, for there are a large number of trees both in the grounds and the woods. Where grown in the latter, and under the conditions most favourable to the production of timber, the trees have formed straight stems, and timber derived from them has been found to possess great durability. One of the most beautiful features within the grounds is the magnificent avenue of this fir, planted

CUPRESSUS LAWSONIANA ERECTA VIRIDIS, SEGGIEDEN.

about 65 years ago, and the trees approaching 100 feet high, and with a proportionate spread of branches. Leading from the old castle to the new chapel is an avenue of Araucaria imbricata, and this, if not equal to the one formed by the Douglas fir, is so remarkably good as to constitute a notable feature. Another avenue certainly not less interesting than those mentioned is that formed by the English yew. At the upper end of this avenue, or yew walk as it is commonly designated, are trees between 300 and 400 years old, and forty or more feet high, and with boles of quite exceptional size. The lower part of the avenue is formed with younger trees that are about twenty-five feet high, and therefore of large size as compared with yews that are generally met with. In other parts of the grounds there are other yews of an age fully equal to the oldest in the avenue, and one of the largest has a head exceeding 200 feet in circumference.



A FAMOUS BEECH HEDGE ON THE MEIKLEOUR ESTATE.
Height 100 feet.

To refer, however briefly, to any considerable proportion of the magnificent specimens that are met with in a walk through the principal drives would require more space than could well be spared, and, notwithstanding the interest associated with them it must, for the present, suffice to enumerate a few only of the most noteworthy. The piceas are very strongly represented, and of these mention must be made of P. sitchensis, a distinct and handsome tree of vigorous growth, and over 100 feet in height; P. Pattoniana (P. Hookeriana), one of the most beautiful of coniferous trees when growing vigorously as is the case here, is well represented, and among the specimens is one with a graceful pendent habit and a glaucous hue. The Servian spruce (P. Omorica), one of the most promising coniferous trees of recent introduction, is so well advanced as to bear cones and indicate its distinctive characteristics. Among the more noteworthy of the abies are A. Albertiana, A. Mertensiana, A. nobilis, the last-named one of the most handsome of the several species, and the numerous trees in the grounds are remarkable for their great height and splendid colouring. The largest specimens are 90 feet or more in height, while some seedlings planted 20 years ago are now 45 feet high and making growth at the rate of 30 inches annually. A. grandis, a species hardly less beautiful than A. nobilis, and a great favourite in Scotland, as evidenced by the many fine specimens in gardens north of the Border, and A. sachalinensis, a species but little known owing to the difficulty in growing it satisfactorily. Interesting also are the fine examples of Cryptomeria japonica spiralis, one of the most distinct of the Japanese conifers, Juniperus recurva, and Sequoia gigantea. Among the newer pines, Pinus Ayacahuiti, P. pentaphylla, and P. Koraiensis were noticed in a thriving state. One might use many adjectives in making reference to the conifers at Murthly Castle, but as the limit of space is reached, it is not possible to do more than say that they are all remarkable for their great height, the splendid development of the branches, and for the skill exercised in their management by Mr. J. Laurie, who has long had charge of the Murthly Gardens.

Meikleour House.

Meikleour House, the Scottish seat of the Marquis of Lansdown, lies some seven or eight miles to the north of Perth, and is readily reached by train to the station on the Aberdeen line of the Caledonian Railway Company, which is between one and two miles distant. The more pleasant way would probably be to drive out from the city, and take the famous beech hedge which forms so distinct a feature of the estate on the way. The mansion is reached by a drive traversing a finely wooded park, and occupies a charming position on the north-east side of the Tay, a short distance above the point where the Isla mingles its waters with those of this fine river. Of quite modern date, and in the style of architecture known as mixed French, its handsome elevation and stately proportions appear to great advantage in a setting of splendidly developed trees and wide-spreading lawns.

It would be possible to enumerate many handsome trees of goodly proportions that occupy positions in the grounds immediately surrounding the mansion, but the most remarkable is perhaps the ancient silver fir which, rising to a height of 100ft. or more, and well furnished to the ground, contributes greatly to the attractions of the arboreal features. On the lawn are a few bold masses of rhododendrons which grow luxuriantly and bloom with great profusion, and of these the most notable is the group of Rhododendron caucasicum, which annually blooms so freely as to resemble during the season of flowering a mountain of snow. I had intended giving an illustration of the mansion and grounds to show the fine effect obtained from breadth of treatment in the arrangement of large grounds, but an accident to some negatives taken here and at Ballathie renders it impossible to do so.

A feature of considerable importance in the grounds is the fine avenue formed by beech, lime, and sycamore trees, which, commencing at the far side of the lawn is immediately opposite the centre of the mansion. From the mansion and that part of the lawns in line therewith a pleasing view, looking down the avenue, is obtained of Dunsinane Hill in the distance, while from the other end a good view is obtained of the mansion.

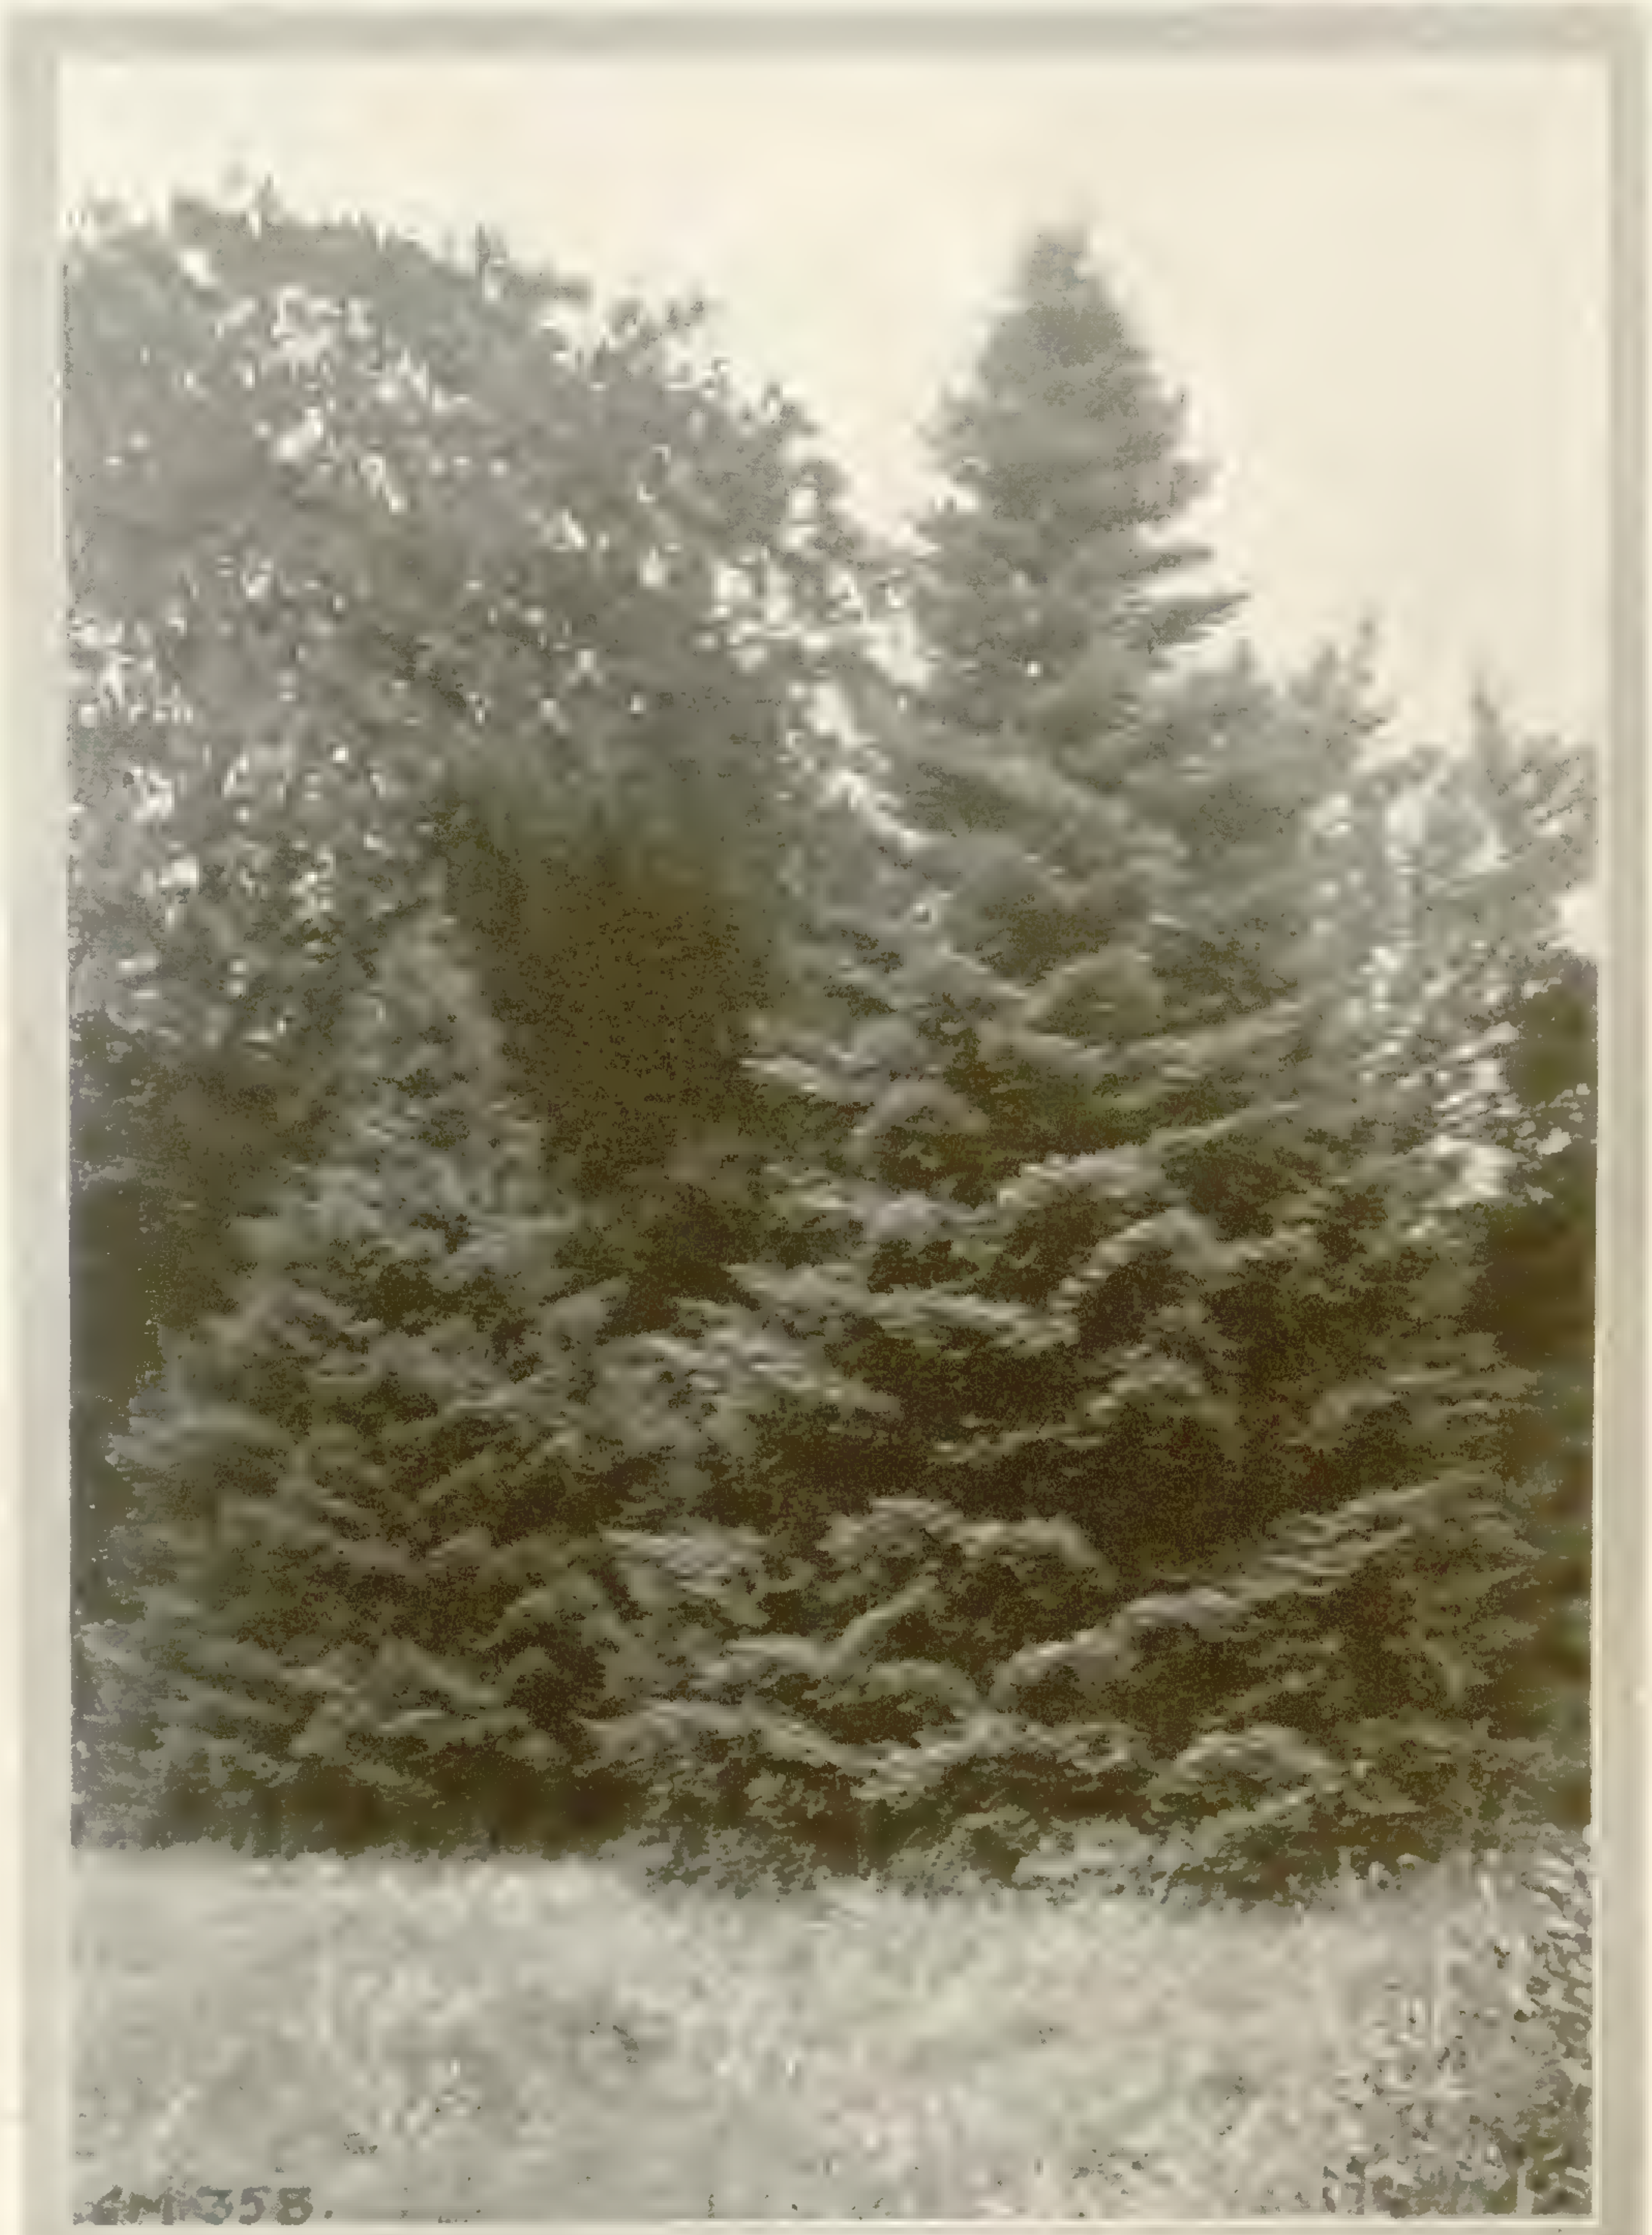
In the park are many deciduous and coniferous trees of noble proportions, and one might linger long in enjoying their distinctive charms. Mr. Donald Matheson, the estate agent, who has occupied his present position for about forty years, and has the direction of the gardens as of other parts of the estate, evidently developed early in life a strong affection for beautiful trees. Hence we find that quite early in the seventies he was busily engaged in planting some of the finest of the coniferous trees in the park and pleasure grounds. On the margin of the former there is a magnificent group of Abies Douglasi formed with trees planted by Mr. Matheson in 1872, and now over 100ft. high, while sweeping the ground with their graceful branches. It is not without interest that the trees were planted in the months of April and June, and that they have increased in height at the rate of nearly three feet annually. Here also is a group of exceptionally fine trees of Picea Webbiana, ranging from 50 to 60 feet high, and handsome specimens of P. Pinsapo, two of which are herewith illustrated, and other of the best kinds; P. nobilis, is represented by trees 60ft. in height and perfect in contour, and remarkable for their fine colour, and with reference to the latter point Mr. Matheson said that, according to his experience, grafted trees were invariably the brightest in colour. Highly interesting also are the specimens of the horizontal form of the common yew. This grows quite flat, and forms at Meikleour House table-like specimens about three feet in height and eighteen feet in diameter. This variety was found by Mr. Gorrie and distributed in the usual course, but it would not appear to have received much attention from the general body of planters.

Within the kitchen garden we find long ranges of houses devoted to grapes, peaches, and nectarines, and these are so admirably furnished with vines and peach and nectarine trees that it is not easy to resist the temptation to refer to them in detail. Among the peaches is a large tree of great age, bearing large fruits with firm crimson flesh, and remarkable for their high flavour, and near it is a tree of the Elruge nectarine that has occupied its position during the past 36 years, and possesses the vigour and productiveness of a tree ten or twelve years planted. Barrington and Stirling Castle peaches, and Dryden, Lord Napier, and Humboldt nectarines are also held in high favour. Of quite exceptional merit are the crops of grapes, both Muscats and the early and late varieties being remarkable for their fine colour and high finish, as well as for weight of bunch. It was interesting to note how much heavier were the bunches of Madresfield Court on the lower part of the canes, as compared with those higher up.

Of special interest is the great beech hedge which proves so great an attraction to the Scottish tourists, and it is not surprising it should do so, for no such hedge has a place in any other part of Great Britain. The hedge is on the road between Perth and Blairgowrie, and has a length of 510 yards and a height of 100 feet. It was planted in the year 1715, or nearly 200 years ago, and not as sometimes stated about the middle of the eighteenth century. To keep the hedge in order it is pruned every seven years, and to accomplish this task is by no means an easy matter. For the purpose a strong ladder 35 feet high, on wheels, is provided, and this is fitted with a platform large enough for two men to stand, and, indeed to readily move about. To prune the hedge to the top of the ladder is an easy matter, and above this to a height of 45 or 50 feet the pruning is done with an averruncator worked by two men, one man guiding the cutter and the other having charge of the string by which the cutting leverage is applied. Above the point reached by the averruncator the hedge is pruned by foresters, who ascend the trees armed with light billhooks and provided with stout straps that, when passed round their bodies and the trunks of the trees, obviate all risk of accident. Mr. Matheson has carried out the arrangements for pruning them five or six times, and on no occasion has there been the slightest accident.

Ballathie.

This, the charming residence of Colonel E. R. S. Richardson, is within a short distance of Meikleour House, and occupies a delightful position on the banks of the Tay. The grounds are extensive and exceedingly beautiful, and it is with much regret that the unfortunate accident mentioned previously should have prevented me giving illustrations of some of the more distinct features. The drive by which the mansion is reached is over a mile in length and is admirably furnished on either side with finely grown limes and conifers. Very beautiful is the entrance lodge built in the Swiss style, and the visitor cannot well fail to appreciate the taste shown in the selection of the design and the site for the building. Especially deserving of mention is the success which has been achieved in the grouping of coniferous trees alongside the approach to the mansion, and the charming effect that has already been created. The trees are as yet comparatively young, but they have made sufficient progress to develop their distinctive characteristics and to indicate how liberally they will contribute to the attractions of the grounds at no distant date. These well thought out and excellent planting effects have been produced from Colonel Richardson's own ideas, and under his personal supervision, and the results achieved amply demonstrate his rare judgment and good taste, and show how keen is the interest he takes in his beautiful gardens.



MAGNIFICENT SPECIMENS OF PICEA PINSAPO, MEIKLEOUR HOUSE.

Without attempting to deal in detail with the arboricultural features of Ballathie, it may be mentioned that they include several yews whose age is reckoned in centuries, and a splendidly developed specimen of the golden Douglas fir (Abies Douglasi aurea), whose foliage presents a striking contrast to the hues of the more sombre coloured trees with which it is associated. Contiguous to the mansion is a large geometric flower garden, the beds cut in the grass, and the planting singularly effective and tasteful. Mr. J. Davis, the able gardener, is especially successful in the combination of flowering and foliage plants, and the colouring of the scheme, while not wanting in richness, is not too strong, and the general effect is extremely pleasing. Intersecting the kitchen garden is a broad walk flanked by borders of proportionate width, and those devoted to annuals form a delightful feature. It is evident that Mr. Davis is fully conversant with this interesting class of plants, for their vigour indicates the provision of well-tilled soil, and they are given ample room for their full development. Several long ribbon borders, planted with suitable subjects, constitute a feature both tasteful and effective, and at once attract the attention of visitors. These borders have as a background an espalier fence, and, furnished with several hundred cordon apple trees, the fences form an excellent screen to the vegetable quarters, and yield liberal supplies of fruit large in size and of high quality.

The plant and fruit houses constitute a strong feature of the Ballathie Gardens, and the skill with which they are managed is sufficiently indicated by the high position Mr. Davis invariably occupies in many of the more important classes at the Edinburgh and Perth exhibitions. On many occasions the premier award in the class for groups arranged for effect at the exhibitions of the Royal Caledonian Horticultural Society has been made in favour of Mr. Davis, who has much taste in arrangement as well as skill in cultivation.

Pitfour Castle.

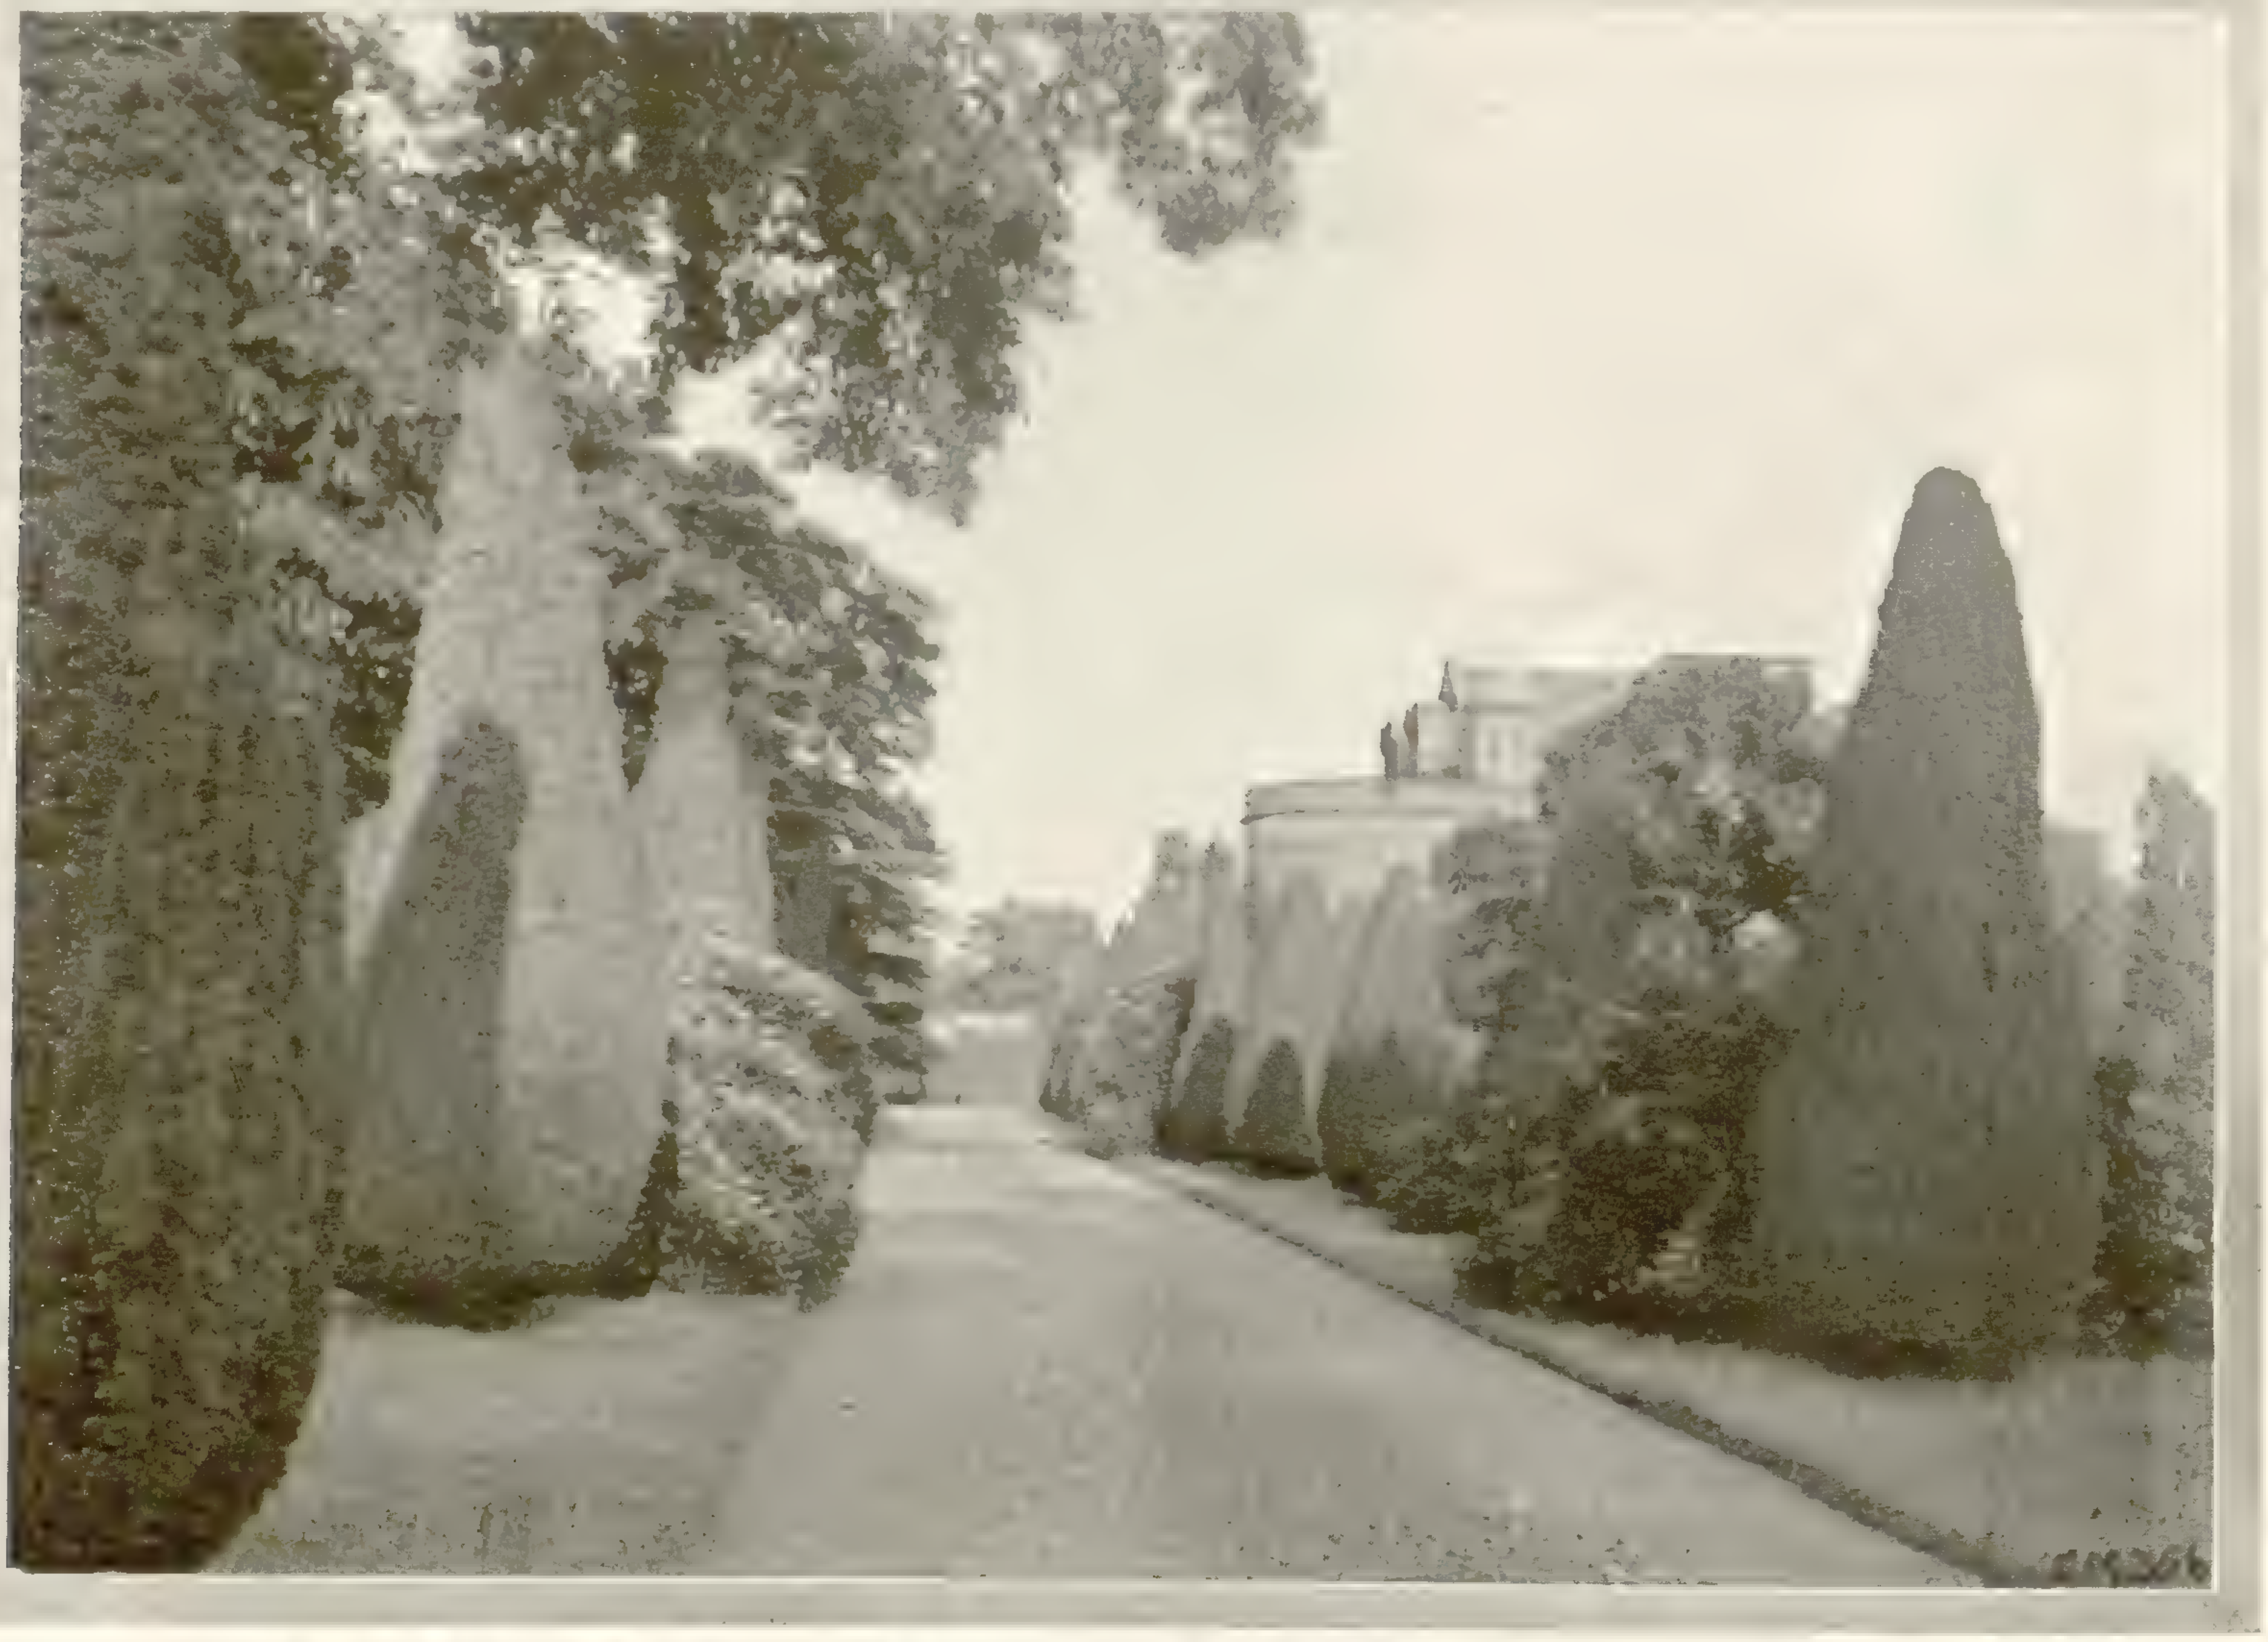
Leaving Seggieden and continuing in the direction of Dundee for three miles or so, the gardens of Pitfour Castle, the seat of Sir E. A. S. Richardson, Bart., are reached, and within them the visitor will find much to engage his attention, whether he be interested in fine trees, beautiful flower gardening, or the cultivation of fruit in the open and under glass. The mansion is of handsome elevation, and possesses in a marked degree the air of stateliness that pervades so many of the Scottish residences of the highest class. It has a delightful environment, and commands scenery less bold perhaps than some in the neighbourhood of Perth, but of surpassing beauty.

One of the most distinct and interesting of the several features that attract the special attention of the visitor is the large and beautiful hardy plant garden. Instead of the hardy herbaceous plants and other perennials being grown in borders alongside the principal walks, in the kitchen garden, and in borders skirting the lawns, in common with the practice that so greatly obtains, these attractive subjects are grown in large beds and in groups in a spacious garden wholly devoted to them, and one can hardly fail to appreciate the change. With the herbaceous plants are associated groups of shrubs, specimen trees, and beds of roses, so that an interest is maintained in the garden from early in the spring until late in the autumn, and the effect produced at those periods in which the flowers are most abundant is such as to at once appeal to the plant lover. In a garden of limited dimensions this plan of providing for a representative collection of hardy perennials would be difficult of execution, if not practically impossible, but there are many establishments where an enclosure of this description could be readily made, and a quite new and charming feature provided. We need not give the names of the herbaceous plants, of the roses, or of the trees and shrubs, because as so readily understood they include all the best in their several sections, and an enumeration of these would require considerable space, and probably prove somewhat tedious. On all sides were proofs of Mr. Shields' skill in the cultivation of hardy perennials, and the roses display such vigour as to suggest that their roots have the advantage of deep, well-tilled soil.

Leading from this garden to the mansion is a broad walk with cupressus and variegated hollies on either side, of such large proportions as to produce a very distinct effect. The trees are about twenty feet high, and the cupressus and hollies are arranged alternately, the latter being of pyramidal form and remarkable for the brightness of their leaf colouring. On the western side the mansion is approached by a carriage drive, which is flanked by lines of Irish yews of large proportions and perfect in contour, as so well shown in the illustration thereof. In the grounds are fine specimens of Abies nigra, A. Douglasi, Cedrus atlantica, Cedar of Lebanon, Picea cephalonica, P. Pinsapo, P. Lowi, and P. Webbiana.

In the large kitchen garden was much to interest, both in the open and under glass, and while it is not possible to deal with this important department in detail, it must be mentioned that the cultivation of pears as cordons is carried out with much success by Mr. Shields. The trees are admirably formed, in the best possible health, and in the majority give an abundant yield of excellent fruits. Especially deserving of mention also was the somewhat formally arranged border of annual and other flowers, which produced a bright display of colour, and was of value for its distinctness.

George Gordon.



CARRIAGE DRIVE WITH AVENUE OF IRISH YEWS, PITFOUR CASTLE.

THE ALTAI ROSE.

One of our earliest, and also one of our most charming wild roses is that from the Altai Mountains, sometimes called simply Rosa altaica, but more correctly designated R. alpina altaica. A good bush, almost covered with its large creamy-white flowers, is a picture of beauty indeed, and when at its best is certain to command the commendations of all who love the rose, even if more devoted to the double than the single roses. It makes a good plant for a low wall, but is even more beautiful when seen in bush form, when its elegant branches and hosts of flowers are displayed to much better advantage. If I recollect aright, it was at Glasnevin that I saw it first, and it was added to my garden at the earliest opportunity, and has been a cherished rose ever since. It is fairly vigorous when established, and I have met with plants at least six feet high, but it can be kept dwarfer by pruning in the ordinary way. Still, I think these wild roses are much finer when allowed to grow into large proportions, and as R. altaica will thrive in almost any position, space can surely be found for it to have full development somewhere. S. Arnott.

Horticulture at Turin.—It is proposed to hold three horticultural exhibitions of an international character at Turin in 1911. The exhibitions will be held under the auspices of the Royal Horti-Agricultural Society of Piedmont, and, as at present arranged, they will take place in May, September, and October.

BEAUTIFUL GARDENS OF SHADOW.

It is in the heat of summer that shaded gardens show at their best, and are of value far above that of sun-scorched expanses—a fact we are too apt to forget in those days of winter and spring, when we should raise and purchase plants to adorn them. Again, the reason why many shady borders are fatal to plant life is that the soil has become sour through want of attention during the blossomless seasons. Land in shadow needs very frequent surface forking and weeding to encourage it to throw off that moisture which sunshine cannot conquer. The incorporation of sharp sand in considerable quantity is excellent, and leaf-mould should also be employed, both as an addition to the soil and a thick protective mulch upon it, for heavy rains filter through this light material, instead of beating earth hard and lying in pools upon it. A little study of these matters, and the work that they suggest, will enable a gardener to achieve fine foliage and floral results even where no sunshine rests.

A last resource, of infinite service where the ground is naturally wet and heavy, is to strew large and smaller rocks in picturesque groups over a bed or border; another plan is to turn a bed into a mound of soil, held up by scattered rocks, and change a flat border into a one-sided bank in the same style, sloping it from the background of wall or fence. These methods will result in a well-drained soil. It is not only as a preparation that shaded ground should be frequently surface-loosened, but the attention should be paid it when plants are in place; even a single root of Solomon's Seal, or London Pride, if carefully watched, will be seen to respond to this kind of good culture, becoming larger and greener in the course of a few weeks. As an edging for a large shaded border London Pride cannot be excelled. To raise it from seed is easy, and a large quantity can thus be gained, besides which there is a specially elegant variety, Saxifraga umbrosa serratifolia, with cut-out leaves and a deeper pink in the white flowers. Seedlings in boxes of sandy soil, in a cold frame, can be allowed to grow on until they are a fair size, when they may be put out in the ground at once, and I have found a spring sowing quite as successful as a late summer one.

A wide border in shadow can be made attractive almost at once by judicious planting, the formal, or row upon row, style being most suitable. A belt of white pinks, followed by one of London pride, another belt of the pinks, and one of dwarf orange wallflowers, a wider belt of London pride, then a broad mass of single blue Campanula persicifolia, backed by white foxgloves, with a final background of Solidago altissima, will supply lavish bloom.

The rich hue of purple honesty is one we should make use of largely; masses of this early summer bloomer will make a warm display, that will be less missed afterwards if there are as many clumps of purple foxgloves; the surroundings of these flowers may consist of the yellow poppy, Meconopsis cambrica, the exquisite fern-like foliage and white florescence of spiræas, and the variegated trails and blue star-flowers of Vinca minor.

Other beds and borders in shadow can be made beautiful by other flowers; there is the German iris, for example, offering the richest violet, and the gold and bronze, white and blue of its rarer varieties, all of which are willing to bud and open without sun. The native tall yellow water iris is no mean ornament for the garden, and it seems impossible to discover a soil in which it will not thrive. Sweet rocket, antirrhinums, Vinca major, sweet williams, verbascums, hollyhocks, and the violet, many-belled Campanula glomerata, I have had in profusion and fine quality in a north border backed by a high fence, and between tall houses, a draughty alley where not five minutes' sunshine a day was ever experienced. Sedum acre and Asperula odorata made a fine carpet for the ground, the former being of especial service to show up clumps of common blechnum and hartstongue ferns.

Hypericums are grand plants for covering huge stretches of soil, indeed the popular Hypericum calycinum is not seen at its best unless it can luxuriate by itself, forming a kind of covert. The taller, and the shrubby hypericums are all admirable, while if actual shrubs are needed we may safely employ the crimson-tinted Berberis aquifolium, which will give yellow bloom and blue-purple fruit in abundance. The snowberry tree is another subject that is just as good in shade as sunshine, its fresh young green foliage in spring being exceedingly welcome, its pinky summer florescence interesting, and its long-hanging, white, autumn berries weighing down its branches by their numbers.

Mention has not yet been made of phloxes; these alone give innumerable brilliant colours, the cerise and orange-salmon varieties being gayest of all, while the white varieties stand out prominently. Day lilies and Turk's cap lilies, if sufficiently massed, give fine displays; the ordinary white Japanese anemone and lavender Michaelmas daisy will flower in shade too; so will yellow mimulus. The secret of making the best show with the flowers that can be relied on for the shadowed garden is to surround masses of them with foliage of a tint to contrast forcibly; thus a couple of dozen plants of scarlet phlox will look more striking if they stand all together within a yard-wide belt of pinks. White phlox in the midst of Hypericum calycinum

AN ATTRACTIVE BORDER OF ANNUALS, PITFOUR CASTLE.

presents a fine appearance. Even the woodland primrose creates a noteworthy feature of a garden when it covers a large stretch of ground.

When centre height is needed for a bed in shadow nothing can be better than a pole of natural wood climbed by a fine-leaved ivy. M. H.

ADONIS.

The species of Adonis form a most charming group of hardy perennials, and valuable on account of their early flowering. In some cases the flowers appear in December, at a time when there are few subjects in bloom in the border or rock garden. The area of distribution of the family, as a whole, extends from the Pyrenees and Central Europe to Russia and Japan. While possessing varied growth, they have a long period of flowering, extending from December to July. Various shades of yellow predominate in their flowers, but in recent importations from Japan a few white and purplish shades have been introduced. As regards culture, all the members of the genera delight in a good deep, rich garden soil, and should not be disturbed when once planted, as a good colony, when well established, is very attractive, both on the rockery and in the herbaceous border.

One of the best of the species is Adonis amurensis, sometimes known as Adonis davurica. It produces tufts of graceful fernlike foliage, and glistening golden yellow flowers about two inches in diameter during January and February. There is a splendid group of this species in the rock garden at Kew, and this has occupied its present position some years, and I do not remember to have ever seen finer flowers. The height is about eighteen inches. It is a native of Siberia and Manchuria. A distinct form, which may be regarded as a geographical variety is Adonis Kiknasaki from Japan. This differs from the type in its extreme earliness and finer cut foliage, while its flowers are more cup-shaped, and they are lemon yellow. Growing in heavy clay soil in the North of London, it was in bloom in the open border on New Year's Day, although not protected in any way from the weather. During the last few years a double-flowered form of the typical species, A. amurensis, known as A. amurensis fl.-pl., has been introduced from Japan, and is undoubtedly of much merit. Its flowers are deep golden yellow, perfectly double, with a ring of deep green segments in the centre. This double form does not, however, bloom so early as the other varieties mentioned, being generally at its best in March, but it is quite as easily grown.

As it name implies, A. pyrenaica, is a native of the Pyrenees, and is distinct, both in foliage and flower, from any other kind, while it is also the latest to flower, reaching its fullest development in June and July. In height, when well established, it attains quite 18 inches, with branching stems and large saucer-shaped golden yellow flowers, quite two inches across. Its foliage is also very ornamental, being finely cut or divided, and deep glistening green. A. vernalis is probably the best known of the genus, and a useful subject for the rockery or front row of the herbaceous border. The flowers which are produced in quantity during March and April, are golden yellow, and average quite three inches across on established plants. Its extreme hardiness and free flowering qualities render it useful for massing, while its price now places it within the reach of all lovers of hardy plants.

A. Volgensis, which has been received from Russia, is intermediate in character between A. vernalis and A. pyrenaica, having branching stems, and scale-like leaves at the base of the stems. The flowers are yellow, produced during April, and the sepals are hairy on the outside. By some authorities it is regarded as a hybrid between the two species previously noted, and is sometimes known as A. Walziana. Some of these species can be raised from seed, and increased by careful division of the crowns when dormant; but when there is no occasion to increase the stock, the plants should be disturbed as little as possible at the roots. E. S.

Finchley.

SWEET PEA JOTTINGS.

In the southern counties, especially where the soil is light, and rain has not fallen sufficiently to provide that genial condition of soil and atmosphere so essential to free growth, growers are complaining that their sweet peas are flowering freely or bursting into bloom, but growth is very slow. In some of the seed-growing districts the plants are by no means strong, and rain is ardently wished for; indeed, in many parts of Essex rain would be welcomed during May, June, and early July, provided it stayed away altogether and gave the sun a full chance during August and September. One grower, further south, writes that if the present conditions continue he will be able to show new sweet pea seed at the National Sweet Pea Society's show on July 24, but no flowers.

There is a great keenness among many of those who have but lately taken up sweet pea culture, and the manner in which they discuss varieties and methods of culture and the naive manner in which they ask for information is very cheering, and very indicative of a long and bright future for this favourite and popular flower, but it is rather exacting, both as regards time and patience.

The question of accepting exhibits sent by post or carrier, and the staging of the same when received, is one exercising the minds of not a few sweet pea lovers who live at some distance from the show place. The committee of the N.S.P.S. has, so far, set its face against accepting and staging exhibits in this way. This may seem hard upon an ardent amateur away in the country, but there are several matters to consider, such as the time and labour occupied in setting up numerous exhibits, the risks of transit, and the skill of the person setting up the blooms. The business is, at best, an unsatisfactory one, and if Mr. John Brown's flowers win first prize, Mr. W. Robinson believes that his own flowers were not properly taken care of and staged, or they would have obtained the premier award. If amateurs could but see their flowers after these have been closely packed and forwarded, and after a journey of twelve or more hours, they would not soon forget the appearance they present. In many cases well-developed flowers would improve 30 per cent. if the ends of the spikes were cut, and then placed for a few hours in water, but there is not time for this resuscitation if the flowers arrive only an hour or two before judging commences, while, if the flowers were to arrive overnight, they would have been cut so early as to prejudice their chances of success.

In the matter of varieties it is interesting to note that two of the three varieties to which I recently drew attention have been granted the A.M. of the Royal Horticultural Society. The one that did not gain an award, is, in my estimation, more entitled to it than Dobbie's Mid-Blue, which gained the A.M., good though this variety is. The variety that failed to win the blessing of the R.H.S. Floral Committee is Mrs. Andrew Ireland, a beautiful wavy variety that I am told is very like Burpee's Apple Blossom Spencer, but this latter I have not yet seen. Clara Curtis is fine, and the best of the yellow shades, though, so hard-working are the raisers, Miss Hemus has a deep cream seedling that may strongly compete with it for first place. Agnes Eckford and Queen of Spain are charming, and the way in which those and Lady Grizel Hamilton attract the attention of the ladies, leads me to believe that a long period will elapse before hooded varieties go out of fashion and cultivation. Menie Christie and Rosie Adams are much alike; both are very fine sweet peas, and give a distinct colour effect, but one of these varieties will be sufficient for small growers.

A few days ago I inspected a large breadth of seedling sweet peas, all the result of careful cross-fertilisation, and in every case the full pedigree is on record. There were scores of lovely things, and not a few specially fine ones. Some of the latter had enormous blooms, and I am sorry I did not measure the width of the standard in several. But I found myself wondering whether this enormous (for sweet peas) size gave our popular flower an added beauty and dignity, and came to the conclusion it did not. I dislike that excessive frilling or waving that makes a sweet pea flower resemble a crumpled mass of petals, and I also dislike that excessive size in the standard and wings which produce a floppiness utterly foreign to true beauty.

Mr. Basile, of Weybridge, has some wonderful sweet peas this year, if those he brought up to the Franco-British Exhibition the other day are a fair sample. As a combination of good size, rich colour, substance, and length of stem, I have never seen anything to beat them, and he puzzled not a few of the specialists whom he asked to name them. As Mr. W. J. Unwin remarked, Mr. Basile grows so finely that a small-flowered variety becomes a prizewinner in his hands. Ware Mr. Basile on July 24.

Chas. H. Curtis.

ABELIA TRIFLORA.

The several species of abelia are all showy shrubs, though, unfortunately, it is only in the warmer parts of the country that they can be grown to perfection in the open ground. There are, however, many places where at least two sorts may be grown successfully if given wall protection. These two species are A. chinensis and A. triflora. The former is most frequently met with, sometimes being seen as a pot plant in a cool greenhouse, again, as a wall specimen, or sometimes as a bush in the open ground.

A. triflora, on the other hand, is more rare, and is seldom seen except in a cool greenhouse or against a wall, though in favoured localities it can be grown successfully in the open ground, under which condition it assumes the proportions of a large bush. It is a native of the Temperate Himalayas, and was known in Paxton's time, for a figure of it is given in "Lindley and Paxton's Flower Garden," Vol. III., p. 93, tab. 91. The deciduous leaves are lanceolate, about one and a-half inches long, and less than half an inch wide; on very vigorous plants, however, they often become larger. The corolla is tubular, with the free lobes of the petals expanded in the form of a star. The tubes are pink in colour, and half an inch wide; the lobes are white, and a third to half an inch across. The calyx is long, linear, and hairy, and retained after the fall of the petals.

This species succeeds in ordinary garden soil, and is doubly valuable, as it blooms in June and July after many of our trees and shrubs are over. If cuttings are inserted in sandy soil in a close case in July they root readily, and good examples for planting in permanent situations may be had in two years' time. W. D.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE STRAWBERRY INDUSTRY.

The extraordinary growth of the strawberry industry during recent years is one of the most surprising features of latter-day horticultural enterprise. It is very evident that the public is much more fond of the strawberry to-day than it was five and twenty, or even a dozen years ago, but it can hardly be said that this is because the fruit is now more excellent in all respects than it was then. Certainly we have berries which are larger and more pleasing in appearance, and the fruit is marketed in a more satisfactory and inviting way, but those who can remember the exquisite flavour of some of those varieties whose names are nowadays little more than a memory will vouch for it that the flavour of the twentieth-century strawberry is no great improvement—if, indeed, it is as good—upon such old favourites as British Queen, Dr. Hogg, Vicomtesse Héricart de Thury, and Sir Joseph Paxton.

LOADING UP STRAWBERRIES FOR MARKET, BOTLEY RAILWAY STATION.

The public fancy, one fears, is tickled more by appearance than by taste, but, after all, if the public is satisfied that is the chief thing, and the grower must cultivate those sorts that pay him best. Amateurs will still find a place for the old, small-berried kinds, whose flavour is their chief recommendation, while the market grower will confine his attention to such of the newer sorts as are heavy croppers, good-looking, and able to stand handling and packing.

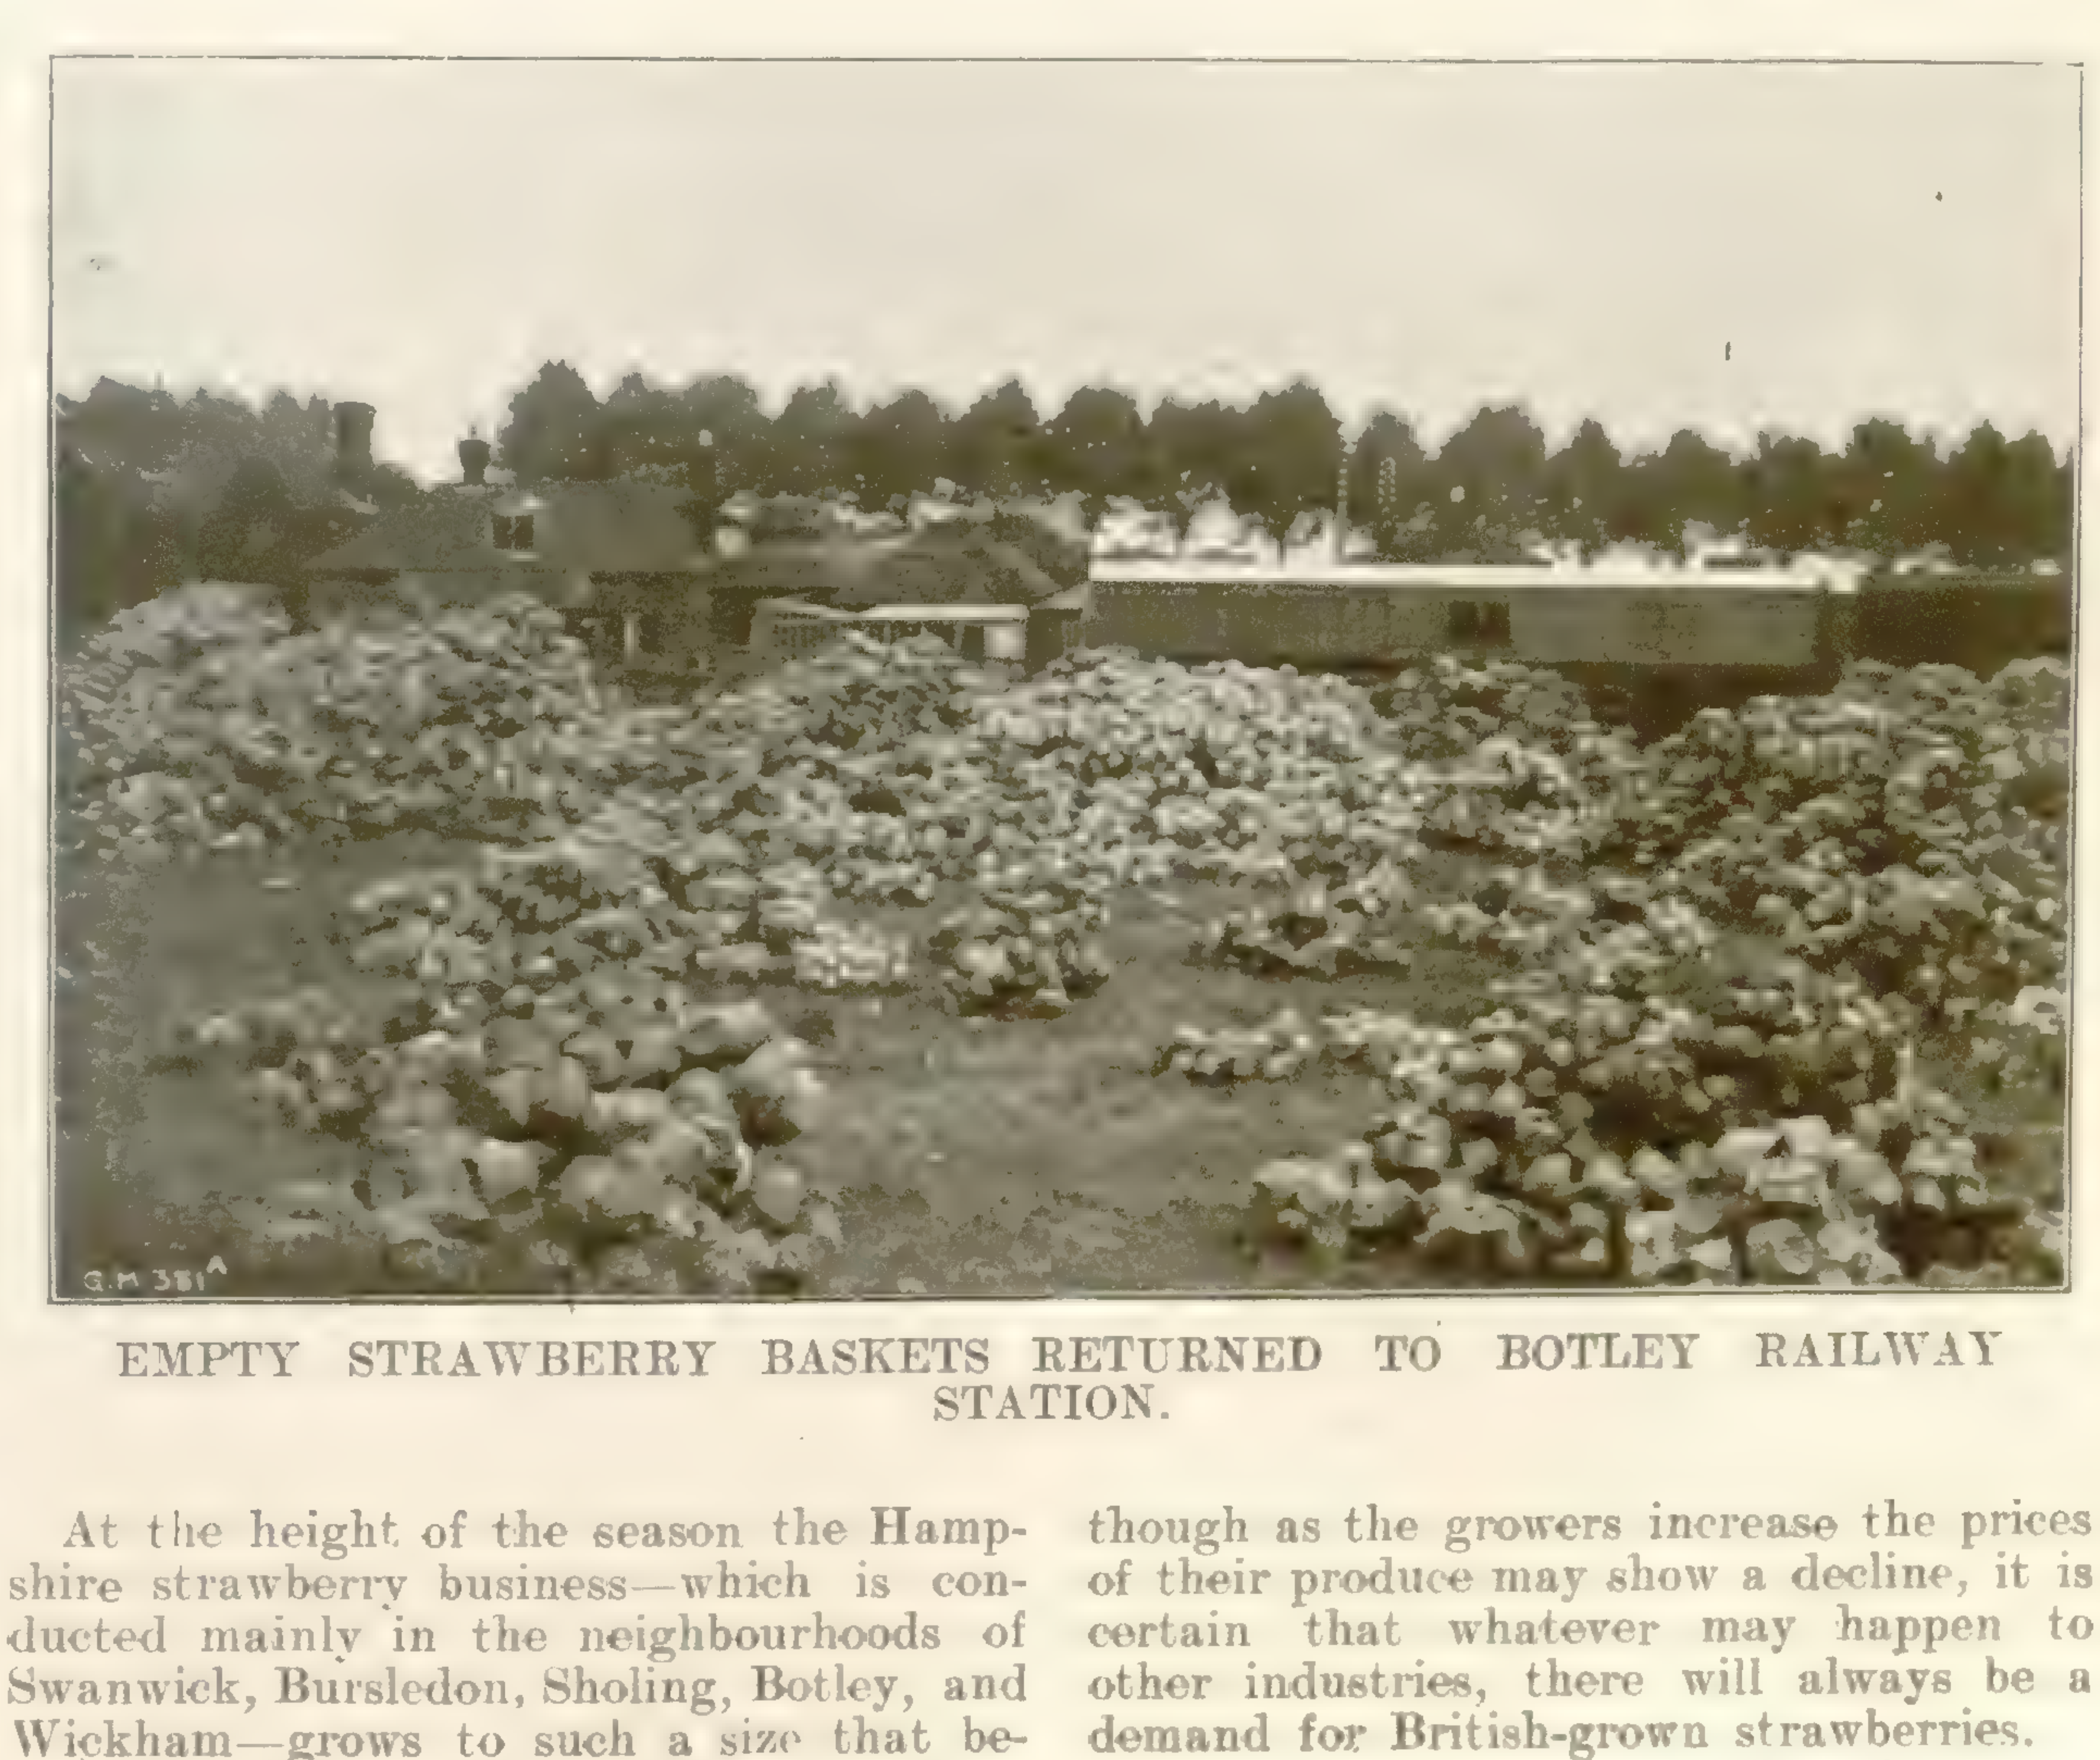
Few people have any idea of the present extent of the strawberry-growing business, and a few particulars may therefore be interesting. France sends us an immense quantity of fruit every year, the bulk of it being early strawberries, which reach the market during April, May, and June. Most of this fruit comes from the Brest district, and the trade is now so important that the growers charter their own boats for its conveyance to English ports. The following figures, which are supplied by the courtesy of the Great Western Railway Company, show the shipments of fruit to this country during the last two seasons. It should be mentioned that the totals include a few small consignments of early peas, but, in the words of the company, "this is a very small item; the traffic consists almost entirely of strawberries." The figures are as follows:

	1906.	1907.
Strawberies (Brest to Plymouth)	1,416 tons.	1,125 tons.

The West of England also sends some fairly large consignments of fruit to London, strawberries again forming the bulk. A few gooseberries and cherries are included in the following figures, the different kinds of fruit not being recorded separately by the railway company:

	1906.	1907.
Strawberries (Saltash and Tavistock districts)	428 tons.	433 tons.

But the bulk of the strawberries sent to London and other large towns comes from the Hampshire gardens in the Southampton district. The supply from that county comes in immediately after the Cornish berries, and generally a few days before the Kentish crop. The fruit is marketed in handle baskets, a practice which prevents their being piled one upon the top of the other, and the fruit is therefore marketed in much better condition than when packed in the Kentish peck baskets. The latter are flat, and hold about 12lb. of fruit, while the Hampshire baskets contain no more than 4 to 5lb.



EMPTY STRAWBERRY BASKETS RETURNED TO BOTLEY RAILWAY STATION.

At the height of the season the Hampshire strawberry business—which is conducted mainly in the neighbourhoods of Swanwick, Bursledon, Sholing, Botley, and Wickham—grows to such a size that between 60,000 and 80,000 baskets per diem are despatched from the various stations of the district, with the result that the London and South Western Railway Company, which has practically a monopoly of the traffic, is obliged to run as many as eight special trains a day laden solely with strawberries, besides despatching several vanloads by the ordinary trains. Altogether about 150 vanloads are sent away daily, and picking continues so long as the fruit fetches a shilling a basket.

An idea of the size of this important industry, which has developed so wonderfully of recent years, and found employment for thousands of men, women, and children, may be gathered from the fact that there are about 150 growers in the neighbourhood of Southampton, each of whom grows strawberries by the acre, and reckons his crop in tons. London takes about half the entire crop, and the rest goes to the Midlands, North of England, Scotland, and even Ireland. Through trains are now run from the principal stations in the strawberry districts to all the large towns, the fruit being packed on shelves in special vans to avoid crushing. A good use has been found in this connection for old third-class carriages, many of which are now fitted up as fruit vans.

The best year on record in the Southampton district was 1907, in spite of the gloomy, sunless weather, which was by no means favourable to the rapid ripening of the crop, and necessitated several pickings. Previous to this the best year was 1904. The crops for the last four seasons are given below:

	1904.	1905.	1906.	1907.
Strawberries (tons)	4,250	3,400	2,794	4,705
No. of baskets ...	1,900,148	1,500,000	1,250,000	2,100,148

From these figures the immense importtance of so large an industry to the inhabitants of the district, as well as to those who come from far and near during the picking season, will be readily understood. Indeed, there are few, if any, agricultural or horticultural enterprises that employ so much hand labour. The active picker, earning pay at the rate of 1½d. per basket, can make 10s. to 15s. per day, and even children can earn as much as 2s. 6d. to 3s. 6d. by industrious picking. And although as the growers increase the prices of their produce may show a decline, it is certain that whatever may happen to other industries, there will always be a demand for British-grown strawberries.

East Sussex.

TIMELY ATTENTION TO VEGETABLE CROPS.

At this season the spring-sown and planted crops will be fairly established and growing freely, and it is too often the case that through pressure of other work at this time they are, to a great extent, allowed to take care of themselves. When this is the case it is mainly to favourable weather conditions if the best results are thoroughly satisfactory. Even with every attention to cultural details it is not always that we can command success. Yet I think it will be generally admitted that the closer we observe these the greater are the chances of obtaining it.

No garden is complete without a well-arranged water supply, with hose to effectually direct it to crops. For the next two months we may reasonably expect a high temperature, and should rainfall be light it must be counteracted by a mulch or watering to prevent the crops from suffering from a check to their growth. It is at this time also that insect pests are particularly liable to attack some crops. I will enumerate a few that are liable to injury from drought, etc.: The pea, if not in a deep and rich soil, is one of the first to give way; the foliage takes on a glaucous colour, which is often the forerunner of an attack of mildew. When this unnatural colour is seen half measures should not be used, but the plants, if possible, be given a thorough soaking of water at the roots. This watering should be accompanied by a liberal syringing of the foliage in the afternoon, and dusting with flowers of sulphur. As soon as the foliage has assumed its natural colour give the plants a watering of liquid manure; this will be useful in assisting to swell up the peas in their pods. Mulching of the surface soil is also a great aid in retaining the moisture in the roots.

Too early sowing of celery and checks of various kinds, such as drought at the roots, are fruitful causes of the plants running to seed, which, unless they are blanched early, and used at once, are worthless. To prevent this, in the case of the main crop, keep the plants supplied with sufficient moisture during their active growth. Periodically, a boy may be profitably employed in damping over the foliage and dusting it with soot to prevent the celery fly depositing its eggs upon the leaves. Should they become badly infested have the infested part of the leaf removed and burnt.

Young plants of cauliflowers are particularly liable to suffer from drought, and also from slugs eating their young leaves, which tend to reduce their value in consequence of the plants turning in early and producing only small heads. To prevent this, as far as practicable, give timely waterings, with frequent stirring of the surface soil, or mulching with manure. Grass mowings from the lawn are not recommended for small plants, as they act as a harbour for the slugs. Keep the leaves dusted with soot and lime to make them distasteful as far as possible till growth is nicely moving, when the nuisance will subside.

To assist the setting of the flowers and the growth of the pods of runner beans an application of liquid manure water at the roots will be highly beneficial. In high situations, where heavy dews do not reach the plants during the night, a syringing of the foliage after a bright day will also act beneficially upon them. With due attention to keeping the larger pods picked, a maximum amount of produce will be obtained till autumn frosts arrive and cut them down.

Lettuce require constant care, especially during the summer months, as they so soon run to seed and become useless for the table. Frequent sowings are necessary. I find it advantageous at this season to sow thinly in lines, and reduce the plants to the requisite distance apart: this practice not only saves time in planting, but the plants invariably grow away better. If the thinnings are planted they give a succession to the permanent plants. Select cool borders, and provide the plants with plenty of moisture for the next few months.

These suggestions are not intended as a calendar of operations, but are merely a few hints concerning those plants that are very susceptible to suffer from the drought, etc. From a few hours' attention of this nature a crop may be materially helped, and in some cases altogether saved without seriously affecting other matters, Nature usually yielding to liberal treatment when rightly directed. In support of this, a market grower of early cabbages near here was for years successful in cutting them quite a fortnight in advance of other growers in this neighbourhood, and even of those also who planted them on sheltered borders in rich ground. To be equal with him some growers sowed in June, but the result was not satisfactory, as a large percentage of the plants ran to seed. The secret of his success turned out to be a simple one. His method was to send a man once a month among his plants, from January onwards, with a short-handled hoe; holding the plant with one hand, he loosened the surface soil round it with the hoe, at the same time sprinkling a small amount of nitrate of soda or sulphate of ammonia round them. His plants grew with great vigour with this attention, and, being large and early, the crop was remunerative. I need not say that his method has been copied by others and attended with the same success. One accustomed to the work a man can attend to a large number of plants in a day, and the expense is small as compared with the enhanced value of the crop.

TRANSPIRATION.

Transpiration in plants means the evaporation through the pores of the leaves of the surplus water supplied from the root system after a sufficiency has been used by the cells for their various purposes. The great extent to which this goes on, especially in warm weather, is evidenced at once if we sever a branch and see how quickly the leaves flag, wilt, and wither, owing to the escape of the water which previously had filled their cells and kept them turgid, and which, normally, would be at once replaced by a fresh supply, which, however, the severance had now cut off.

If we examine a leaf microscopically we shall find its surface dotted over more or less profusely with myriads of little orifices termed stomata, and it is through these that the said water is evaporated, and the carbonic acid of the air is absorbed. They are extremely numerous even on a small leaf, and if we consider what this means in the case of a huge tree, it strikes the mind as marvellous that even the immense and widespread root system of such a tree can collect enough water to maintain a supply, especially during long periods of dry weather.

The vegetable world, however, possesses wonderful powers of adaptation to circumstances, and thus we find foliage to vary very much to meet the variations of environments as regards water supply and consequent transpiration. In shaded, damp habitats the leaves present a much larger area, and, consequently, transpire much more than under opposite conditions of drought and heat, which, while setting up an extra drain upon the foliage by way of transpiration, tend at the same time to restrict the root supply. As a consequence of this, in the process of adaptation and evolution, even practically leafless plants have been evolved, such as the cacti, euphorbias, and other kindred vegetation, where the leaves proper are suppressed, and their functions are performed by enlarged stems. In other plants, under like conditions, thick fleshy leaves are packed closely together, so as to present the smallest possible area to the sunshine, while, at the same time, their compact masses are admirably adapted to check evaporation from the soil in which they grow.

Transpiration, however, is only a secondary factor in leaf evolution, the main purposes of all foliage are to catch the sunlight and to absorb carbonic acid as a formative ingredient of plant structure, which the sunlight enables the cells to break up into its components oxygen and carbon, the latter then resuming solidity both as a building material and a contributory ingredient in the starches, sugars, etc., formed in the cell laboratories. Water, however, is an essential to all these processes, and forms, indeed, in some plants, the great bulk of their substance. This water is collected by the roots and mixed with the earthy salts the roots also absorb, forms the sap. To fulfil its office and reach the possibly far distant points of active growth, some of the water must work its way from the tips of the most extended roots to the tips of the remotest twigs, and it is here that the faculty of transpiration figures as a motive power.

The necessary water having reached its distant goal, it fills the cells there, its contained salts are utilised, and part of it evaporates through the cell walls and the pores we have alluded to. The cell, deprived thus of part of its contents, sucks by a process called osmosis, an equivalent from its nearest neighbours, and these in turn draw upon the veins and veinlets of the leaves and the channels for supply beneath the bark of twig, branch, and trunk, until this sucking impulse is transmitted to the very root system itself, and the myriads and myriads of transpiration pores are seen to constitute as many microscopic pumps.

It is obvious from all this that the work going on in a large tree, especially in the active period of spring growth, is really inconceivable in its extent, and that even at a later period, when the foliage growth is completed, and only the work of completing the fruits has to be done (no mean task in itself, by the way, when the crop is heavy), there is still a vast deal to be done to keep up the aqueous supply still needed to replace that which is constantly being passed off through the pores of transpiration. To this evaporation, too, is due the coolness of foliage, which, if it attained the temperature of the blazing hot sunshine to which it is often subjected, would infallibly shrink up and die.

Chas. T. Druery, V.M.H., F.L.S.

YORK JUBILEE GALA—MESSRS. J. CYPHER AND SON'S GROUP OF ORCHIDS.
(Equal First Prize.)

Tomatoes for Winter.—In order to obtain good fruitful plants before the winter sets in the seeds should be sown at once, for it is a waste of time to delay this sowing until the autumn, and then to expect good results. It is rarely a good set of fruit can be had after October unless the weather is very fine indeed. Sow the seeds in boxes or pans in rich, friable soil, dibble the seeds in about 2in. apart each way, and place them on a greenhouse shelf or in a cold frame. When the seedlings are up, keep them as sturdy as possible by placing them well up to the glass. When potting them off into 3½in. pots, rougher compost may be given. Two useful varieties for this sowing are Sutton's Winter Beauty and Vick's Criterion, the latter, a very old variety, but one that sets splendidly in heat, and is a most prolific fruiter.—T. W. Birkenshaw.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MILTONIA VEXILLARIA. — The most difficult period in the cultivation of the varieties of this species, is between the removal of the flower spikes and the appearance of young growths. Where a house can be devoted to their culture the difficulty is considerably minimised, but when grown under the same conditions as that provided for plants in full growth, whether it be in the intermediate house or the odontoglossum house, it is no easy matter to provide suitable requirements. Atmospheric moisture is the greatest difficulty, as excess is at any season likely to produce damp-spotting on the foliage and cause a permanent disfigurement. It is a good plan to keep the plants as near resting conditions as possible, and, above all things, only sufficient moisture to keep the pseudo-bulbs and foliage plump. I would advise placing the plants in a light position in the odontoglossum house during the next few weeks, until the growth commences, in preference to keeping them in a warmer house.

M. BLEUANA, the hybrid derived from M. vexillaria and M. Roezlii is one of the most desirable of this class of orchids; it is not only exceedingly variable in its forms and markings, but it is by no means a difficult plant to deal with. It is practically a perpetual grower when treated in the warm intermediate house. Plants that have recently flowered will have their young growths in an advanced state, and any repotting necessary is best attended to when the new roots make their appearance at the base of the developing growths. The pots used should be filled to two-thirds of their depth with drainage—chopped bracken roots suit miltonias well as a drainage medium. The compost consists of about equal portions of fibrous peat, broken oak or beach leaves, and chopped sphagnum moss, with sufficient sand or broken crocks to render it porous. The compost should be pressed moderately firm, and about half an inch depth of chopped sphagnum should be placed on the surface of the material.

AUTUMN-FLOWERING VARIETIES of miltonia, such as M. candida, M. Regnelli, M. Peetersiana, and the dwarf-growing members of the M. spectabilis section, which are now developing their flower scapes, must have every encouragement. These latter are best placed in a position or suspended near the roof glass, where they may obtain every advantage procurable from the available light. In fact, the whole of this section flower more satisfactorily where little or no shade at all is given, but with more light, moisture requirements need greater attention. It is a good plan to syringe the plants overhead two or three times a day in bright weather. Insect pests, such as thrips and red spider are the most troublesome; for the latter carefully sponging the leaves is the best method of destruction. For thrips dipping or spraying with some safe insecticide at regular intervals will keep the pests under. Rain-water should always be used for insecticide, as the use of hard water frequently leaves a white deposit on the leaves.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

ANANASSA SATIVA VARIEGATA.—The variegated pineapple is easily cultivated, and the plants are extremely useful where ornamental stove subjects are in demand. They are raised from suckers, similar to the pandanus, these being separated from the parent plant, potted in small 60-sized pots, and plunged into bottom heat. Under these conditions they readily take root, and then it is advisable to move them to a drier place on a shelf near the glass; the syringe may be used freely on bright days. Ananassas do not require over much water, as they succeed best under drier conditions than most plants, and on no account ought they to be watered until the soil is thoroughly dry. In order to maintain the best colour the plants should be put in small pots and kept root bound. They succeed well in a compost of good fibrous loam and peat, with coarse silver sand and lumpy charcoal. The variegated pineapples are less subject to insect pests than most plants. Mealy bug will sometimes prove troublesome, but care must be taken not to propagate from infested plants.

BILLBERGIA RHODOCYANEA.—This bromeliad is well worth cultivating on account of the handsome and unique markings on its foliage. Plants may be raised from suckers taken off any time during the summer, so long as they have time to establish themselves before the winter sets in. They succeed well in turfy loam and sand.

NIDULARIUM MEYERDORFI. — This most interesting plant is well worth attention; the bright green leaves form a beautiful base for the small, brilliant scarlet leaves which surround the flower spike. It succeeds well in a warm, moist atmosphere. Our batch of plants is now producing flowers, and after the flowering season the suckers are separated from the parent, and, whenever possible, those with a few roots are selected.

ALLAMANDAS.—These require further attention to thinning out of weakly growths and training the remaining shoots into their permanent positions. Plants that are growing freely will require a plentiful supply of water, and frequent applications of diluted liquid manure, with alternate top-dressings of an approved chemical fertiliser. If careful attention is paid to regular feeding and watering the flowering season will be much prolonged. Plants intended for exhibition specimens ought to be trained upon the desired shapes just previous to the flowers showing colour.

GENERAL REMARKS.—The occupants of the stoves ought to be thoroughly overhauled from time to time, and a diligent search be made for insect pests. The leaves of ornamental foliage plants are much improved in general appearance by an occasional sponging, damping down the paths and stages at intervals throughout the day in order to maintain a moist átmosphere. Careful manipulation of the ventilators is strongly advised in order to counteract sudden changes of temperature.—JOHN DONOGHUE, Bardon Hill Gardens.

THE KITCHEN GARDEN.

SEAKALE.—The growth in young plantations has now advanced far enough to permit of the removal with the knife of all except one crown to each plant. This is most important work if good, well-grown crowns are required. Should the plants show signs of weakness, apply liquid manure or a good sprinkling of nitrate of soda, choosing showery weather if possible, or watering it in. Keep the soil well hoed between the rows to check weeds and benefit the plants.

RHUBARB.—To secure good plump crowns for early forcing, it is not wise to pull rhubarb after this date, for it is most necessary that the crowns should develop to the highest degree. Young plantations should be encouraged as much as possible by placing round each root some good cow manure, and watering them occasionally with liquid manure. Cut away all flower stems as fast as they appear.

GLOBE ARTICHOKES. — These always form an agreeable change to the stock of vegetables. The "heads" are coming on very well, and the plants should have copious supplies of liquid manure in fairly strong doses, about once a week, which will still further increase the size of the heads. Another method may be also adopted; that is, removing all the lateral heads that appear when they are the size of a walnut. Chards are the blanched hearts of the plants, and are by many preferred to blanched cardoons. Globe artichokes should be renewed about every three years, especially on hot dry soils.

SPRING CABBAGES. — A pinch of seed may be sown about the 15th of the present month, making the seed-bed in an open situation, and if the weather is dry and hot the soil should be well soaked with water over night. It will be ready for the seed next morning, which should be sown quite thinly and covered over with fine soil. When the plants have attained a height of 1½ inches they should be pricked out in lines three or four inches apart. This will be sure to check the little plants, but they will soon recover and make up for lost time if well attended to. I always rely on Ellam's Early Dwarf and Flower of Spring. It is always prudent to make two sowings of this important vegetable, the last one about the latter end of the month, and it will be found that the plants from this sowing generally give the best results.

SHALLOTS.—These are on the point of ripening, and when the growth is completed lift and dry them ready for storing later on. A most suitable place for drying them is under a north wall or hedge, then they can be cleaned during some wet day, and properly stored.

MUSHROOMS. — These are always welcome. It is too hot now in the mushroom house, so if a bed could be made up under a north wall outside, or in an underground cellar, a few dishes could be obtained in August. Where suitable meadow land abounds, spawn inserted now about 2in. deep would give some produce a little later on, if the weather is at all suitable for the spawn to work.—T. W. BIRKENSHAW, Hatley Park Gardens, Sandy.

THE ALPINE KNOTWEED.

Those who grow the Alpine Knotweed (Polygonum alpinum) in its rightful home —the higher reaches of the rock garden, and in its most effective position—skirting a boulder's base, or filling a rift between boulder divisions, can fully appreciate its rare beauty, and realise somewhat the splendid picture of the elegant florescence the plant gives in its native home amid the rocks of the Southern Alps. Grown, however, amid the rank and file of border plants, and treated liberally the while there is very little to admire in it, as its sprawling habit defeats the best efforts of staking, and its flowers are virtually inferior to those of P. bistorta or P. affine in effective display.

It is one of the many good alpines that respond favourably to repressive measures, and its greatest beauty is manifest in positions where it literally struggles to live. Thus grown its habit becomes normal—a loose, flax-like sheaf of elegantly lanceolate leafage, overtopped by pretty white branched spikes of flowers that look exactly like the side growths of Spiræa japonica on light airy stems. It is one of the prettiest free-habited alpines one can grow, well adapted for both large and small rockeries, and peculiarly acceptable to the artistic sense when seen skirting the stone pediments of vases and other ornamental stonework, or framing a low flight of stone steps, whether rough hewn or of worked stone. It increases fairly rapidly by stoloniferous growths, but is not likely to develop into a troublesome weed at any time if not unduly fed. One needs to see an old specimen happily planted and associated under starveling conditions, first, in spring, for its tender leafage; secondly, at midsummer, for its white florescence; and, lastly, in the autumn season for its display of autumn tints in leaf and stem. It is good at these periods.

G. B. MALLETT.

Roses may be grown to perfection by following the instructions given in ROSES AND THEIR CULTIVATION by T. W. Sanders. A selection is given, with description of all the best varieties, and full details of culture outdoor and under glass. Price 2s. 6d.; by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NEW PLANTS, ETC.

◆

ODONTOGLOSSUM CRISPUM PRINCESS OF WALES.

A very fine and beautiful white variety of the best form and size. It is white, tinted with rose on the sepals, and the lip has a very large yellow crest. F.C.C., R.H.S., June 23. Mr. H. Ballantine, gardener to Baron Schroder, The Dell, Egham.

EPIDENDRUM VIRENS.

A very graceful species, and one that should prove very useful for decorating, either as a plant or as cut flowers. It has medium-sized, pale creamy green flowers, and a white, purple-stained lip. The flowers are borne freely on long, wiry, branched stems. A.M., R.H.S., June 23. Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

DENDROBIUM JERDONIANUM.

This somewhat rare species from Western India has been shown once or twice before, but never in such fine condition. It has stiff, hirsute stems, and produces its vivid orange flowers in dense clusters. A.M., R.H.S., June 23. Sir Trevor Lawrence, Bart., Dorking.

ODONTIODA WICKHAMENSIS.

A pretty little orchid, derived from Odontoglossum crispum and Cochlioda sanguinea. It has small rosy-pink flowers, freely speckled and dotted with red-brown. A.M., R.H.S., June 23. Mr. Redden, gardener to G. W. Bird, Esq., Manor House, West Wickham.

SWEET PEAS.

The King.—A very fine addition, producing big, wavy blooms of the same brilliant colouring as King Edward VII. A.M., R.H.S., June 23. Messrs. Dobbie and Co., Rothesay.

Dobbies' Mid-Blue.—A pretty sweet pea, with fine erect standard. The colour is a bright shade of blue. A.M., R.H.S., May 23. Messrs. Dobbie and Co., Rothesay.

STOKESIA CYANEA ALBA.

A beautiful white-flowered form of the well-known blue species. It appears to be a free grower, and it carries numerous aster-like flowers. A.M., R.H.S., June 23. Mr. Amos Perry, Enfield.

KNIPHOFIA GOLDELSE.

One of the dwarfer varieties, but one that is charming in the mass. It has medium-sized heads of yellow flowers. A.M., R.H.S., June 23. Messrs. R. Wallace and Co., Colchester.

ANTHURIUM PRES. VIGER.

A very large variety of Anthurium Andreanum, with big broad spathes of a rich crimson-red hue. A.M., R.H.S., June 23. Mons. A. Truffaut, Versailles.

DELPHINIUM CAMBYSES.

A handsome variety that has a bold spike of beautiful rich blue, double flowers, each with a white centre. The spike is not so dense and stolid as in so many modern varieties. A.M., R.H.S., June 23. Mr. F. W. Smith, gardener to C. Ferguson, Esq., Weybridge.

ERICA CINEREA PYGMÆA.

A very useful dwarf heath, growing about four inches high, and bearing a profusion of brilliant crimson flowers. A good rock garden plant. A.M., R.H.S., June 23. Mr. G. Reuthe, Keston, Kent.

CAMPANULA RADDIANA.

A dwarf species, rather under a foot high. It is very distinct and beautiful, carrying bell-shaped nodding flowers of a very rich violet-blue shade, the colour and effect being enhanced by protruding yellow pistil. The species comes from the Ural Mountains. A.M., R.H.S., June 23. Mr. G. Reuthe.

EREMURUS BUNGEI MAGNIFICA.

This is a glorified E. Bungei, with large spikes and brighter yellow flowers. A.M., R.H.S., June 23. Messrs. Jas. Veitch and Sons, Chelsea.

BEGONIA COL. LAUSSEDAT.

A very low-growing tuberous begonia, suitable for edging and carpeting. It has bright yellow double flowers of medium size. A.M., R.H.S., June 23. Messrs. Jas. Veitch and Sons, Chelsea.

ESCHSCHOLTZIA MIKADO.

A very handsome eschscholtzia that has blooms of largest size and of brilliant orange-scarlet colouring. A.M., R.H.S., June 23. Mr. W H. Gardiner, Mill Street, St. Osyth.

ROSE REFULGENCE.

A hybrid sweet briar, with probably a double portion of the rose in its composition. The foliage is rose-like with a suggestion of the sweet briar, and with some degree of fragrance. The flowers, freely produced, are about three inches across, semi-double, and of a brilliant crimson colour, with whitish centre. An attractive variety. A.M., R.H.S., June 23. Messrs. Wm. Paul and Son, Waltham Cross, Herts.

PELARGONIUM FRED T. HAMILTON.

A fine semi-double variety with large trusses of scarlet flowers. This has evidently been produced by crossing a zonale variety with an ivy-leaved variety. A.M., R.H.S., June 23. Messrs. W. H. Rogers and Sons, Lim., Basset, Southampton.

NEW BOOKS.

◆

SCHOOL GARDENING.

By W. E. Watkins and Arthur Sowman. (George Philip and Son, 32, Fleet Street, E.C.)

As the authors tell us in the preface, this book has been written with a view to giving an account of a year's cultivation of a school garden, and suggesting a systematic method of carrying out the most practical and useful method of dealing with nature study in elementary schools. It gives full details of the various garden processes, and the reasons for them, needed in the cultivation of the—comparatively speaking — limited number of flowers, fruits, and vegetables that are suitable for cultivation in the school garden. In addition there is a concise and clear account of the common insect pests and fungoid pests to which the various crops are liable, and the best remedies for their prevention and extermination. We fully agree with the authors that there are few subjects taught in rural elementary schools which are capable of developing a child's powers of observation and reasoning to the same extent as gardening, and it gives us much pleasure to have evidence of the increased importance that is being given to the teaching of the practical work of the garden in schools in rural districts. We are pleased also to observe the steady improvement in the books relating to school gardening, and we heartily congratulate the authors on the success they have achieved in providing so excellent a book as that now before us. While intended for the assistance of those engaged in school gardening, the book will be found of much value to the amateur with a garden of limited dimensions and to cottagers who are fortunate in the possession of gardens or allotments. We have no information as to the price of the book.

MANURES FOR FRUIT AND OTHER TREES.

By A. B. Griffith, Ph.D. (Robert Sutton, 43, The Exchange, Southwark Street, London.) Price, 7s. 6d.

For a long number of years Dr. Griffith has devoted much attention to the food requirements of plants, and has written several works that are now regarded as text books by those engaged in the study of the constituents of plants and the methods by which they can be the most successfully supplied with the food necessary to their being maintained in a robust state of health. This, we venture to suggest, is the most important of the works written by Dr. Griffith, and, while an excellent guide to both agriculturists and horticulturists in the application of fertilisers, it will be found of special value to those who are desirous of becoming fully acquainted with the composition of the many plants grown for use and ornament.

The historical introduction with which the work opens is of much interest, for therein we have a short yet admirable summary of the advances that have been made in the art of soil cultivation in ancient and modern times, and a brief statement of the theories held by Tull, Bonnet, Dundonald, Liebig, and others with reference to the sources of plant food and the requirements of plants. Not less interesting but of greater practical value are the chapters devoted to plant physiology and the chemistry and bacteriology of soils, and these are deserving of the most careful study by those who are desirous of becoming intimately acquainted with these subjects in relation to fruit culture. The most important feature of the book is perhaps formed by the two chapters in which the composition of fruit and other trees are dealt with. The analyses which the author gives of the ash constituents of trees when studied in connection with the information given on manures for fruit trees, and special manures, will be found of much value in determining what fertilisers to apply to the various kinds of trees that come under the care of the gardener with the fullest assurance of successful results.

While "Manures for Fruit and other Trees" is scientific in method, it does not belong to the dry-as-dust order, but is remarkably interesting and not likely to be lightly laid aside by those who are concerned with the important matters with which it deals. The author is indeed well deserving of the warmest praise for the admirable manner in which he has presented the results of his investigations during the past quarter of a century of the food requirements of the various forms of arborescent vegetation.

HELENIUM BOLANDERI.

From the enormous quantity of yellow-flowered composites that have reached us from North-western America it is possible to select a few that bear the hall-mark of refinement in habit and flower, and recommend them for more extensive planting than is desirable for the many.

Noteworthy among the heleniums is a very fine species named H. Bolanderi, which is not new or very rare, but which every good judge of attractive border flowers invariably wants once it is seen in good condition. It is, however, wholly neglected by many, who, I feel sure, would appreciate its many desirable features. It makes a sheaf-like bush, a yard high and through, and for many weeks after midsummer it is the richest colour note in yellows the border can afford at that season. The flowers range from 1½ to 2½ inches in diameter, and are apparently, but not actually, twice the size of the older Helenium autumnale, of which everyone who had one plant two years ago has now more than enough. The ray florets are pure yellow throughout, and their crimped and undulating margins, often delicately frilled in addition, give an impression of double and treble rows of petals. The cone is a flat-topped sphere of rich mahogany-brown, bespangled with myriads of anthers, the rich velvety sheen recalling some of the darker forms of annual scabious, but is even more beautiful in the perfect foil of the yellow ruff-like petal arrangement. Such a fine plant of easy culture should be grown in quantity for its yield of cut flowers, and particularly in goodly breaks in the flower border, where its colour note is distinctly pleasing. It likes a good loam, failing this, hollow-stemmed flowers of short life, cut or uncut, are an inevitable result.

G. B. Mallett.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.—TWENTIETH ANNUAL SHOW, SOPHIA GARDENS, CARDIFF, Wednesday and Thursday, July 22nd and 23rd, 1908.
Liberal Prizes for all sections.
Silver Plate, Cups, and Medals.
Every facility given to the Trade. Schedules free.
Mr. A. MAURICE BAILEY, Secretary,
24, Duke Street, Cardiff.

NATIONAL SWEET PEA SOCIETY.
EIGHTH GRAND EXHIBITION.
FRIDAY, July 24, 1908.
ROYAL HORTICULTURAL HALL, VINCENT SQUARE, WESTMINSTER, S.W.
Entries close Saturday, July 18.
CHARLES H. CURTIS, Hon. Sec.
Adelaide Road, Brentford.

POTTER'S BAR and DISTRICT AMATEUR ROSE SOCIETY.
(Affiliated to the National Rose Society.)
The Show will be held on THURSDAY, July 16th, 1908. Entries close July 9. Classes for Amateurs open to all England. Classes for Members, Nurserymen, and Others.
For Schedule and Entry Forms, apply to H. R. DARLINGTON, Park House, Potters Bar.

SHREWSBURY GREAT FLORAL FETE.
Aug. 19th and 20th, 1908.
Cash Prizes are offered amounting to above £1,200, with Cups, Medals, etc.
Schedules may be had, post free, on application to the Hon. Secs.
Messrs. ADNITT and NAUNTON, Shrewsbury.

THE EDGWARE AND LITTLE STANMORE HORTICULTURAL SOCIETY'S TENTH ANNUAL EXHIBITION
Will be held on
SATURDAY, July 11th, at CANON'S PARK, EDGWARE.
This magnificent Park, formerly the seat of the Duke of Buckingham and Chandos, is being lent by kind permission of Arthur du Cros, Esq., M.P.

The Society is affiliated with:—
The Horticultural Society.
The National Rose Society.
The National Sweet Pea Society.

ADMISSION:—
1 to 3 o'clock, 1s. After 3 o'clock, 6d. Children half price.
Band, Pierrots, Dancing on the Green, and other attractions.
REFRESHMENTS AT MODERATE PRICES.

WOLVERHAMPTON
GREAT FLORAL FETE.
July 7, 8, and 9, 1908.
Next week.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Ninepence per line, the minimum charge being Five Shillings. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Gardeners' Royal Benevolent Institution.

JUNE 24.

The anniversary festival of this charity, over which the Right Hon. Lord Aldenham presided, was of quite exceptional interest and highly successful in every way. It was, as usual, held at the Whitehall Rooms, Hotel Metropole, and there was a large gathering of the friends of the institution, the company including M. Viger and M. Abel Chatenay, the president and secretary respectively of the National Horticultural Society of France. Lord Aldenham had for his immediate supporters, M. Viger, the Right Hon. Colonel Lockwood, Mr. Arthur W. Sutton, V.M.H., Mr. N. N. Sherwood, and Mr. Harry J. Veitch, V.M.H., treasurer of the institution. The customary loyal toast having been proposed in felicitous terms and duly honoured, the Chairman submitted the toast of "Continued Prosperity of the Gardeners' Royal Benevolent Institution." He said that as the majority of the large company were well acquainted with the history of the institution, and fully appreciated the splendid work in which it was engaged, there was no occasion for him to speak at any length. For the information of foreign friends and the small number of guests who were not acquainted with the history of the institution, he would mention that for the long period of 70 years it had been engaged in assisting gardeners and their widows in their old age, and during that period had disbursed the large sum of £122,000 in pensions. The institution commenced its beneficent work by electing two pensioners, and the demands upon its funds had become so great that it now had 231 gardeners and widows of gardeners on the pension list. The support of so large a number involved an annual expenditure of about £4,000. To meet this the institution had an assured income of about £1,500 only, and had to depend upon voluntary contributions for the balance of £2,500. In addition to the pensions given to those who were fortunate in being placed by election on the pension list, considerable sums derived from the Good Samaritan Fund and the Victorian Era Fund were annually disbursed among the unsuccessful candidates. This assistance, he need hardly say, was greatly appreciated by the recipients, and materially helped them to tide over the period of waiting for election. While all who were in distress were eligible for election, a preference was very properly given to those who had subscribed to the funds. This preference was shown by allotting candidates 100 votes for every £1 they had contributed to the funds of the institution. As the management expenses were derived from invested funds, all the donations go direct to the pensioners. Lord Aldenham spoke of the pleasures of gardening, and urged his hearers to do their best to assist, in their old age, those who had when in their full vigour done so much to add to the happiness of owners of gardens.

Mr. H. J. Veitch responded, and in the course of his eloquent speech, passed under review the work of the institution, and read several letters from pensioners, in which they expressed their gratitude for the generous help they received from the funds of the institution. Mr. Veitch said they had not been able to accomplish so much as they could wish, but it was simply a question of funds, and he should like to see the annual income raised to £5,000 to enable them to elect a larger number of candidates annually. At present they had upwards of thirty candidates waiting for election.

Mr. George Paul, V.M.H., proposed, with his customary ability, the toast of "Horticulture in all its Branches," and this was acknowledged by M. Viger and by Mr. George Munro, V.M.H., both of whom made eloquent responses. The toast of "The Chairman" was in the capable hands of the Right Hon. Colonel Lockwood, M.P., and was drunk with musical honours. Lord Aldenham, having acknowledged the toast, thanked the donors of flowers and fruits for their contributions, and proposed "The Health of Mr. G. J. Ingram, the secretary. This was warmly received and duly acknowledged.

The donations consequent on the dinner amounted to upwards of £2,000, of which sum Messrs. Rothschild and Mr. A. W. Sutton contributed 100 guineas each, the Messrs. N. N., E. and W. Sherwood £150, and the guests at the three Covent Garden tables £227.

The Worshipful Company of Gardeners.

JULY 1.

A presentation of flowers, fruit, vegetables, and herbs was made to the Lord Mayor and the Lady Mayoress at the Mansion House on Wednesday last, the Company being represented on this interesting occasion by Sir Thomas Robert Dewar, J.P., Master; Robert Inigo Tasker, Esq., F.R.H.S., upper warden; Charles Bayer, Esq., renter warden; and Ernest Arthur Ebblewhite, Esq., F.S.A., clerk.

The company was incorporated by Letters Patent under the Great Seal, 18th September, 1605, by King James the First, who declared that the gardeners' inhabiting within the City of London and within the six miles compass thereof should be incorporated as a company, with perpetual succession and a common seal. The King granted to them power to make ordinances for the government of the company, and they duly exercised such power. Their bye-laws were con[illegible] by the Lord Chancellor of England, the L[illegible] Treasurer, and the Chief Justice on July [illegible] 1606. The same monarch granted the company further powers by other Letters Patent dated November 9, 1616. In spite of these charters the company experienced great difficulty in carrying out the provisions therein contained, and in selling their commodities in the London markets, owing to the opposition of unqualified persons; and accordingly, in 1632, they petitioned the then Lord Mayor for redress. Their petition was favourably received, and on June 29, 1632, Sir Edward Littleton, then Recorder of London, issued his warrant to the bailiffs, constables, headboroughs, and other King's officers in the counties of the City of London, Middlesex, Surrey, Kent, and Essex, for the apprehensions of any persons using the trade of gardening in contempt of the charters. This warrant continued in force until the Recorder became Lord Chancellor of England in 1645, and the benefits which it secured contributed greatly to the usefulness and prosperity of the company, and protected the Freemen from carrying on their trade in the London markets.

King Charles the First, by a proclamation of December 3, 1634, for the reformation of the many abuses committed against the company, commanded the then Lord Mayor, and the Justices of the Peace in the before-named counties, to assist the company as much as possible. In August, 1891, the Court of Aldermen gave the company the honour and privilege of the Livery. His Majesty King Edward VII., by Warrant of June 9, 1[illegible] recited the Charters of 1605 and 1616, and granted his Royal Licence and Authority enabling the company to continue to use their ancient armorial bearings.

The company resolved in March last to endeavour to obtain permission to present annually, on June 29, to the Lord Mayor for the time being, a basket containing specimens of flowers, vegetables, and herbs, [illegible] grateful remembrance of the Recorder's warrant of 1632. They accordingly petitioned the Lord Mayor, who, on April 14, was pleased to reply to the effect that it would give him much gratification to receive [illegible] a mark of respect, and promising that [illegible] would ask his successors to continue the observance of this agreeable and pleasant practice.

Owing to the Lord Mayor's engagements, it was decided that the first presentation should take place on July 1, instead of on June 29, the date selected for future presentations.

The Master, in the name of the company, handed to the Lord Mayor a basket containing specimens of flowers, fruits, vegetables, and herbs, arranged in the form of the company's ancient crest. The kinds represen[illegible] included currant tomatoes, beans, carr[illegible] cucumbers, asparagus, peas, radishes, [illegible]nips, Globe artichokes, vegetable marr[illegible] cherries, red and black currants, app[illegible] mixed herbs, red and pink roses, [illegible] cloves, and sweet peas.

The Master then presented the La[illegible] Mayoress with two bouquets, in order [illegible] show the progress of horticulture since [illegible] incorporation of the company. The [illegible] bouquet contained all the English [illegible] which were popular in 1632, and the [illegible] included some of the finest orchids [illegible] known. The Old English bouquet [illegible] stonecrop, sweet thyme, thrift, old [illegible] sweet william, orange lily, stocks, [illegible] snapdragon, mountain cornflower, [illegible]bury bell, Spanish broom, yellow [illegible] mock orange, British harebell, gilly[illegible] everlasting pea, Guelder rose, holly[illegible] honeysuckle, madonna or St. Joseph's [illegible] lily of the valley, French marigolds, [illegible]ram, oleander, ox-eye daisy, pansy, [illegible]mary, York and Lancaster roses, [illegible] campanula, rue, heartsease, bladder [illegible] jasmine, gardener's garter, honesty, [illegible] flower, Portugal laurel, and London [illegible] The second bouquet included a [illegible] choice orchids, including some of the [illegible] of the Lælio-cattleyas and hybrid [illegible]sums.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, June 23.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Dr. A. Voelcker, Rev. W. Wilks, Sir J. T. D. Llewelyn, Messrs. E. M. Holmes, G. Gordon, H. T. Güssow, G. S. Saunders, — Curtis, W. C. Worsdell, G. Massee, J. T. Bennett-Poë, and F. J. Chittenden (secretary). Visitors: Professor Hansen, of Dakota, U.S.A., and Mr. Scrase Dickins.

CHERRIES EATEN.—It was reported that the holes in the fruits of cherry which were received from Sir Robert Harvey at the last meeting were due to the feeding of the larvæ of the Winter Moth.

MALFORMED ODONTOGLOSSUMS. — Mr. Worsdell reported that one of the flowers of Odontoglossum crispum received from G. Wilson, Esq., F.R.H.S., of Haywards Heath, had the three stamens of the outer whorl all developed, instead of only one, as is usual. The second flower had a normal column and normal sepals, but each of the three petals had become partly modified into stamens and bore anthers.

DODDER.—Mr. H. T. Güssow showed photographs of Cuscuta trifolia attacking clover and Kohl-rabi, and of C. chiliensis growing upon lucerne, kohl-rabi, rye grass, and red and white clover. Dr. Voelcker said that experiments had been tried with Chilian clover seed containing dodder, and it had been found that though the dodder had germinated and grown upon the clover in the first year, in the second none had been found, as it had failed to form seed. Mr. Güssow, however, thought that seed was, at least under certain circumstances, produced.

LILY HYBRIDS. — Mr. Scrase Dickins, F.R.H.S., showed seedlings of L. croceum x L. elegans and L van. Houttei. The plants showed extraordinary vigour, which the raiser attributed partly to the fact that they were seedlings, and partly to their hybrid origin. The hybrids do not set seed when pollinated with one another's pollen, but set seed freely when pollinated with pollen from L. elegans. The forms varied considerably among themselves, and forms of L. dahuricum could be well matched among them. The L. elegans parentage was evident in many by the reflexing of the perianth pieces. Unfortunately the hybrids are not disease resisting. A hearty vote of thanks was accorded to Mr. Dickins.

PHLOX LEAVES MALFORMED. — Mr. Worsdell drew attention to the peculiar form at times assumed by the leaves of phlox. Sometimes the leaves appeared as ascidia or as pockets, or merely as wings on the midrib. This condition, Mr. Massee pointed out, was due to the presence of the eelworm Tylenchus devastatrix, large numbers of which were present in the plants. This and other species of eelworm were responsible for many malformations in plants, as is seen in the tulip-rooted oat, the thickened neck of the onion, malformed flowers in cereals and various wild grasses (in one case of Agrostis vulgaris, a malformation due to an eelworm has been taken as a character upon which to found a variety), and warts and knobs upon roots.

ARISÆMA CONSANGUINEUM. — Mr. Massee, on behalf of Mr. H. J. Elwes, showed plants of this new species.

PLANT BREEDING.—Professor Hansen, of N. Dakota, who is passing through London on his way to Russia and Siberia on his fourth journey of exploration, received a hearty welcome from the committee. In the course of his remarks he alluded to the efforts which were being made to obtain fruit trees which would maintain their existence without suffering through the rigours of the American winter, and remarked upon the great measure of success which had already attended their efforts to obtain frost-resistant plums, raspberries, etc.

FRUITS OF LATHRÆA CLANDESTINA. —Mr. Bowles showed capsules of this interesting and beautiful parasite to illustrate the explosive mechanism by which the seeds are flung out of the capsule when ripe. The two valves of the capsule suddenly roll inwards and fling the seeds out a very considerable distance.

PRIMULA ANGUSTIDENS. — From Messrs. Veitch, of Chelsea, came a pan of this beautiful primula, which is closely allied to P. Poissoni, and bears several whorls of drooping deep clear purple flowers upon its rigid erect stems.

MILTONIA VEXILLARIA.—Baron Schröder, V.M.H., sent a spike of Miltonia vexillaria with normal flowers, and another with partially double flowers, which was borne upon a plant divided from the former a few years ago. The parent had always (for over twenty years), borne normal flowers, while each year since its separation the offset had produced semi-double flowers.

BLUE SWEET PEA "ZYPHYR."—From Mrs. R. H. Biffen, of The Gables, Histon, came flowers of a pea raised by crossing Zoë (a medium blue) with a Countess Spencer (Paradise) in 1905. Mrs. Biffen had obtained the same thing from a number of crosses made subsequently between flowers of a deep blue and others of a pink colour, in addition to others, of all shades of blue and of the "Spencer" form.

CULINARY PEAS. — Mr. A. W. Sutton showed the offspring of a pea occurring spontaneously in Palestine, twelve miles from Jaffa, four years ago. Many hybrids have been raised from crosses between this wild form and the best of the cultivated ones, and in some the coloured flower is reproduced, in others the flowers are white; in some the serrated edges of the foliage, normal in the wild plant, are retained, but in others the margin of the leaf is practically entire.

Royal Oxfordshire Horticultural Society.

JUNE 23.

Favoured by brilliant weather, the seventy-eighth Midsummer exhibition of this society was held in the gardens of the Warden of Wadham College, Oxford, and was largely attended. These gardens, formerly the site of an Augustinian monastery, are admirably suited to the holding of a flower show, being rich in noble cedars, copper beech, ailanthus, walnuts, and evergreen oaks; there is also a fine example of Judas tree and tulip tree. In the snowstorm of April last much damage was done to the ornamental conifers, and one remarkable Lebanon cedar was uprooted. Being cut into sections for removal, it was discovered that its age was some 150 years less than had been supposed. The college authorities intend to use the timber, when seasoned, for tables.

Entries for the show were a fair average, the competition in the open to all England classes being keen. For a group of plants, arranged for effect on 220 feet, Messrs. J. Cypher and Sons, Cheltenham, secured the £15 prize with one of their splendid arrangements; Mr. W. Vause, Leamington, second; with Mr. D. Curtis, Iffley Road, Oxford, third. The first and second prize sets were rich in orchids; the third was very chaste, and had some fine maples.

To aid this section Mr. W. Balmforth, gardener to F. M. Ogilvie, Esq., The Shrubbery, Oxford, arranged a design filling fully 250 feet, but not for competition. Its central line was a low arch of cork bark, crowned by a noble palm, and flanked by neat crotons, caladiums, grevilleas, acalyphas, etc. At each of the angles the mounds supported fine specimen crotons, the interspaces being broken up into a series of hillocks, each encircled by choice orchids, with the groundwork filled in with rare stove subjects. On close inspection one noticed numerous examples of Odontoglossum crispum Xanthotes, and fully 200 spikes of good forms of odontoglossums, carrying from 10 to 20 blooms on a spike; very lovely were the specimens of O. lutea-purpureum Vuylstekianum, the spikes of pale yellow blooms proving attractive. The numerous examples of the old Oncidium flexuosum, with its slender racemes, appeared midgets in comparison to the specimens of O. macranthum, with spikes fully fifteen feet in length, and furnished with a 100 flowers each. The group was brilliant with Cattleya Mossiæ, and Mendeli, each furnished with about twenty spikes; then there were a number of Lælio-cattleyas, such as Canhamiana, Fascinator, delicata, splendens, rubiceus, and others.

Mr. W. T. Mattock, Barton End Nursery, Headington, secured the prize for a charming arrangement set out on 120 square feet; Mr. John Walker, Thame, led in the open class for single and double zonal pelargoniums; Mr. A. V. Tuffrey, gardener to Miss Bull, Arncott House, Oxford, had the premier collection of gloxinias; Mr. Joseph Green, Latimer Road, Headington (carpenter), had the best group of tuberous begonias. Exotic ferns were poor, but the collections of nine varieties of British ferns were equal to anything seen at provincial exhibitions; Mr. H. Mount, superintendent of the Oxford University Parks, being first, with Mr. W. F. Cross, Iffley Road, Oxford, second.

Cut flowers comprised displays of roses set out on 72 square feet; Mr. J. Mattock, Rose Farms, New Headington, securing the chief award, also for two dozen varieties, eighteen teas, and twelve vases of roses; Mr. George Prince, Rose Gardens, Longworth, Berks, was second in each class; the prizes for eighteen varieties of roses went to Messrs. W. T. Mattock, and F. Taylor and Sons, Chipping Norton Junction. Mr. Walker was the only exhibitor of cut pelargoniums in the open class. Herbaceous perennials made a blaze of colour, Mr. John Johnson securing all the open awards, and filling more than 100 feet run of staging, in three tiers, with large sheaves of garden varieties.

Sweet peas were largely staged. Messrs. West and Sons, The Market, Oxford, secured the first prize (open to all England) for a dozen bunches; Mr. W. T. Mattock, won Mr. Sydenham's large medal and cash for nine bunches; and Mr. T. Sirman, Stanton Harcourt, secured the society's premier prize for a dozen varieties in the members' section. The best pansies came from Messrs. F. Taylor and Sons; pyrethrums, from Mr. T. Sirman; and iris, from Mr. L. S. Loat, Cumnor Place, Berks. There were seven decorated dinner tables, Mr. W. T. Mattock securing the prize in the open class.

Fruit made a small show. Mr. C. E. Munday, gardener to the Right Hon. Lewis Harcourt, M.P., Nuneham Park, led for white and black grapes, nectarines, and strawberries; Mr. C. Jones, gardener to Sir W. Anson, Bart., M.P., Pusey House, Berks, was first for melons; Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, led in the classes for cucumbers, tomatoes, and a collection of vegetables in eight varieties. In the amateur section, Mr. S. Mold (cooper's foreman), Grandpont, Oxford, headed the list in the classes for fuchsias, zonal geraniums, cucumbers; Mr. T. Anstiss, Brill, scored for hardy ferns, cut zonal pelargoniums, and pansies; Mr. A. Evans, Marston (dairyman), in two classes of roses; Mr. A. Adams, Headington (butcher), for cos lettuce, turnips, and rhubarb; Mr. W. F. Cross, with strawberries, peas, carrots, white and coloured potatoes, and cabbage lettuce; and Mr. W. R. H. Powell, Divinity Road, Oxford (tailor), for broad and long-pod beans.

Non-competitive exhibits, exclusive of the orchids referred to, comprised a large collection of pæonies in variety, from Mr. Johnson, Garsington; three specimen crimson carnations, in pots, furnished with fully sixty flowers each, from Mr. G. Hollingsbee, gardener to Captain A. G. Russell, Wood Eaton House, the variety being John Burns; a miniature rockery from Mr. John Cooper, Hardy Plant Nursery, Chipping Norton; collection of rhododendrons from Mr. J. Osborne, gardener to Mrs. Newhall, Youlbury, Boar's Hill, Berks; artistic floral designs from Messrs. R. Tucker and Sons, Magdalen Street, Oxford; and a collection of delphiniums from Mr. L. S. Loat, Cumnor Place, Berks. To each an Award of Merit was granted.

Richmond.

The summer flower show held in the Old Deer Park, Richmond, is always one of the great attractions in this fashionable suburb. This year, on June 24, the exhibition was a great success from a horticultural standpoint, while, owing to the splendid weather that prevailed, the attendance was a large and fashionable one. The exhibits were so numerous and the competition so keen that judging was not concluded until 1.30. There was an advantageous rearrangement of the tents, and more space than usual was provided for visitors in the tents, all of which tended to comfort and better inspection of the exhibits.

In the group class Mr. Lock, gardener to Sir C. Swinfen Eady, Oatlands Lodge, Weybridge, led the way with an attractive and elegant design in choice flowering and foliage plants, and he was followed by Mr. W. Vause, of Leamington. In a smaller class the prizewinners were Mr. Burfoot, gardener to Lady Waechter, Terrace House, Richmond, who was placed first, and followed by Mr. H. Hicks, gardener to C. M. Bartlett, Esq., East Sheen, and Mr. W. Vause. The latter won first place for six orchids, and also for half a dozen palms, the latter being big and noble examples of kentias and latanias. Mr. Vause was also first for fine-foliaged plants, winning with big crotons, cycas, etc. In other plant classes Mr. H. Hicks was successful for coleuses and for caladiums; Mr. T. Rabitt, gardener to W. S. Edwardson, Esq., Ballari, Sidcup, scored for a dozen tuberous begonias with splendid plants; Mr. J. Foster, gardener to A. R. King-Farlow, Esq., Spa House, Richmond, led for exotic ferns; and Mr. B. Mason, gardener to A. Elsee, Esq., Burlington House, Hampton Hill, scored for fuchsias.

Roses were splendid, and there was a keen competition between the various well-known exhibitors. The Gunnersbury Challenge Cup for forty-eight roses, three blooms of each, was won by Messrs. D. Prior and Son, Colchester, who had fine flowers and a good assortment of colours; Messrs. Harkness and Son, Hitchin, came second, and Messrs. F. Cant and Co., Colchester, third. Messrs. B. R. Cant and Sons, Colchester, came to the front with two dozen trebles, the other prizes falling in order to Messrs. G. and W. H. Birch, Peterborough, and Messrs. D. Prior and Son. Messrs. Harkness and Son led for twelve trebles, Messrs. D. Prior and Son for twelve blooms of one variety, and Mr. E. J. Hicks, Twyford, scored for twelve tea roses. In the amateurs' division Mr. E. J. Holland, Silverdale, Sutton, beat the Rev. J. H. Pemberton, Havering, for twenty-four roses, distinct, and these two strong competitors occupied similar positions for a dozen blooms, Mr. Colin Romaine, The Priory, Old Windsor, coming third. Mr. W. J. Palmer, Netherton Road, St. Margaret's; Mr. G. Penkeril, The Vineyard, Richmond; Mr. B. Mason, and Mr. Bartleet, Severndroog, Shooter's Hill, were also successful with roses.

Sweet peas were again a fine feature, and Mr. T. F. Conway, gardener to the Earl of Dysart, Ham House, Petersham, was placed first for nine varieties; Mr. F. Gower, gardener to the Rev. W. H. Oxley, Petersham, second; and Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, had to be content with third place. For six varieties Mr. Gower led, with Mr. Conway second, and Mr. J. Watson, gardener to W. Compton, Esq., Eastcott, Kingston Hill, third. All showed the finest varieties. In a special class for nine varieties Mr. Conway, Mr. Stevenson, and Mr. J. Watson were placed as named.

Floral designs are always a great attraction here, and once again Miss C. B. Cole, Feltham, was a leading prizewinner, gaining firsts for a basket of roses, three epergnes, and basket of flowers and foliage, but she was beaten for a table decoration in the open class by her sister, Miss N. H. Cole. Miss Gertrude Sage had the best table decoration in the local class.

Mr. Lock was very much to the front in the fruit classes, taking first prizes for peaches, nectarines, and cherries, and second for white grapes. In the latter class Mr. Lintott, gardener to Sir W. Greenwell, Marden Park, Caterham, was first, but he was second to Mr. Weston, gardener to H. J. King, Esq., Eastwell Park, Ashford, for black grapes. Mr. Lock scored again for a collection of six dishes of fruit, his grapes, peaches, and strawberries attracting considerable attention.

In the open class for twelve kinds of vegetables, Mr. Conway was first, and Mr. Lock second; the latter led for tomatoes, but Mr. Conway was again first in the class provided by Messrs. J. Carter and Co., for vegetables, and also in Messrs. E. Webb and Sons' class.

The cottagers', allotment-holders', and children's displays were highly meritorious, particularly the vegetables shown by the former.

Non-competitive exhibits were once more numerous and good, adding materially to the extent and attractiveness of the show. Gold medals were awarded to Messrs. J. Veitch and Sons, Chelsea, for pot roses; Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; Mr. L. R. Russell, Richmond, for foliage and flowering plants; Mr. W. Thomson, Richmond, for palms, etc.; and to Mr. Amos Perry, Enfield, for hardy flowers and water lilies. Silver-gilt medals were awarded to H. Little, Esq., Baronshalt, Twickenham, for a group of handsome orchids; Messrs. J. Peed and Son, Norwood, for hardy flowers; Messrs. W. Cutbush and Son, Highgate, for carnations and hardy flowers, and Messrs. W. and J. Brown, Peterborough, for roses.

FORTHCOMING ENGAGEMENTS.

TUESDAY, July 7.—Holland House Show; judging commences at 10 o'clock; committees meet at 10.30; and luncheon at 1 o'clock; two days.
Wolverhampton Floral Fete; three days.
Bath Rose Show and Fete; two days.
Southend Horticultural Society; two days.
National Amateur Gardeners' Association Exhibition at Winchester House, Broad Street, 7 p.m.
WEDNESDAY, July 8.—Beckenham Horticultural Society.
Hayward's Heath Rose and Sweet Pea Show.
Gosport and Alverstoke Summer Show.
Croydon Horticultural Society.
York Florists' July Show.
Colchester Horticultural Society.
Epsom Horticultural Society.
Tunbridge Wells Horticultural Society.
Hemel Hempstead Summer Show.
THURSDAY, July 9.—Newmarket Horticultural Society.
Eltham Rose Show.
Harrow Horticultural Society.
Stour Valley Flower Show.
FRIDAY, July 10.—Maidstone Rose Club.
SATURDAY, July 11.—Fingall Horticultural Society.
Edgware and Little Stanmore Horticultural Society.
Purley Rose Show.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to [illegible] Editor of the GARDENERS' MAGAZINE, 148 and [illegible] Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for [illegible] or opinion should be sent to the [illegible] GARDENERS' MAGAZINE, "Endsleigh," [illegible] Kew, Surrey, and as early in the week as [illegible] All parcels must be sufficiently [illegible]

The Editor will be glad to receive [illegible] gardens, plants, flowers, trees, fruits [illegible] reproduction in the GARDENERS' MAGAZINE [illegible] also be greatly obliged by correspondents [illegible] early intimation of interesting local events [illegible] to horticulture. In sending newspapers [illegible] matter to which they wish to draw attention [illegible] respondents are requested to distinctly [illegible] paragraph.

CLIPPING BOX HEDGES.—S. V., [illegible] ing: You could not select a better time [illegible] the present for clipping box and other [illegible] green hedges. The shrubs soon make [illegible] growth that becomes hard before winter [illegible] is therefore able to pass through [illegible] weather unscathed. If there is any doubt [illegible] to the ability of the operator to [illegible] hedge in a straight line, it will be an [illegible] matter to strain a few rows of string [illegible] the hedge front and top as a guide [illegible] straightness and depth.

GRUBS IN CARNATION LEAVES.—R. R., Streatham: The grubs in the [illegible] tion leaves are those of Hylemia [illegible] and they are perfect pests in some [illegible] especially near towns. The grubs, or [illegible] tion maggots, as they are generally [illegible] must be carefully sought after and killed. Cut off and burn badly infested leaves, and in other cases pick out the maggot with a pin and kill it. If the maggots or [illegible] not caught while in the leaves they will work along into the stem, and in all probability soon kill the plant. Examine the bed carefully every day, disposing of the pests as far as they can be found. In all probability the attack will presently cease. Spraying with a quassia or tobacco solution [illegible] been suggested as a preventive, but [illegible] to be of little value.

CURLED ROSE LEAVES.—S. [illegible] Derby: Each of the curled up leaves [illegible] a sheltering home for the larvæ of the [illegible] rolling sawfly (Blennocampa pusilla [illegible] best remedy is hand-picking, removing [illegible] destroying the curled leaves directly [illegible] are noticed. This early removal of [illegible] foliage not only prevents the larvæ [illegible] passing on to infest other leaves, [illegible] curled leaves are burned, the larvæ [illegible] vented from entering the soil in [illegible] autumn, there to remain, pupate, and [illegible] rise to adult sawflies next season.

FOXGLOVES.—B. L., Lewes: [illegible] seeds at once, choosing a good [illegible] spotted foxgloves. Sow in pans and [illegible] in a shaded cold frame, and as [illegible] the seedlings can be handled prick them [illegible] on a semi-shaded border where the [illegible] rich and contains plenty of leaf-mould [illegible] these beds they may be transplanted [illegible] flowering quarters in the autumn.

AMERICAN BLIGHT ON OLD [illegible] F. L. G., Lincoln: The shoots are [illegible] teeming with American blight, and [illegible] this awful pest will become [illegible] throughout your garden, and [illegible] your neighbours' gardens also. [illegible] burn all the shoots, and then grub [illegible] burn the tree, taking the greatest [illegible] care not to permit the dispersal [illegible] This will be by far the best plan, [illegible] acknowledge the tree is of little value.

THE SPROUGHTON HOE.—[illegible] Hunstanton: The Sproughton hoe is [illegible] cellent tool in careful hands, but [illegible] hands it may become a far deadlier [illegible] than a Dutch hoe. In the latter [illegible] blade is held firm by two curved arms [illegible] in the Sproughton hoe the blade is [illegible] one arm only, and thus it can be [illegible] closely up to and around the stems [illegible] Both edges of the blade are [illegible] action by thrusting and drawing the

The free end of the blade, slightly pointed, is also very useful if cautiously manipulated.

BUDDING.—A. T., Faringdon: It is usual to associate the operation of budding with [illegible] fruit trees, and most kinds of ornamental trees can be successfully increased by [illegible]. The directions for budding [illegible] apply equally to trees, with the [illegible] that while the buds of the former [illegible] inserted in the young growths, the [illegible] fruit and ornamental trees are best [illegible] wood one or more years old. The best months for budding are July and August, the wood and bark being then moderately firm and so full of sap that they part from each other, this latter condition being essential to success. In the pre- [illegible] the stocks for standard and half-standard roses a beginning should be made during the second half of June or quite early in July. The first step will be to remove all but two or three of the strong, well-placed shoots near the top. If these are unduly vigorous they may be shortened by having eight or nine inches taken off the top; but when the shoots are shortened the insertion of the buds should be deferred until they are beginning to make new growth, as it is essential the sap should be flowing freely. The buds should be inserted on the upper side of the selected shoots, and as near the base as may be convenient. For the supply of buds select, from the varieties it is desired to increase, shoots that are of medium size and moderately firm. From these shoots cut off the leaves immediately under the lower leaflets, and proceed to prepare the buds. Take a sharp knife, insert it about an inch below the base of the leaf, and by means of an upward cut take off a shield-like piece of the bark, with a small piece of the wood, and in doing this bring the knife out about half an inch above the bud. Remove the small slice of wood without bringing away the bud, and the shield-like bud is ready for insertion in the stock. The latter is prepared for its reception by a longitudinal cut about one and a-half inches long, and a cross cut at the top. The bark is then raised on each side of the longitudinal incision, and the bud slipped underneath and cut across the top so that the latter fits the bark of the stock immediately above the incision. The shoot at the point where the bud is inserted is bound with raffia, raffia tape, or worsted. It is essential to success that the bark of both the buds and stocks part freely from the wood, and it will be better to wait for rainy weather than to attempt the work when the weather is so dry that the bark adheres firmly to the wood. Dwarf roses should be budded so closely to the surface that when they are transplanted the junction of the bud and stock can be buried below the surface. Fruit trees should also be budded low down, and when quince stocks are used for pears the buds should be inserted as for dwarf roses, as it is most important the junction should, when the trees are transplanted, be below the surface to enable them to produce roots above the stock.

WOBURN WINTER WASH.—S. W. E., Farningham: The Board of Agriculture, in a recent issue of its "Journal," gave the following formula for the Woburn Wash, for use as a winter dressing for fruit trees: Paraffin, 5 pints; sulphate of iron, ½lb.; caustic soda, 2¼lb.; lime, ¼lb.; water to make 10 gallons. The wash may be prepared as follows: (a) Dissolve the sulphate of iron in about 9 gallons of water; (b) shake the lime in a little water and then add a little more water to make this into a "milk"; (c) run b into a through a piece of coarse sacking to remove grit; (d) churn the paraffin into the mixture; and (e) just before using the wash add the caustic soda in the powdered condition and stir thoroughly. The wash may be used during February and March so long as the plants are dormant and cold weather prevails.

PINKS.—F. R. W., Cardiff: You will find the information you require, and also particulars of carnations and their culture in "Carnations Picotees and Pinks," post free 2s. 10d., from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.

BLACK SPOT ON ROSES.—H. D. H., Birmingham: The spotting on the rose leaves sent is due to a fungus known as Black Spot (Actinonema rosæ). The diseased leaves should be removed and burned, and any that fall should be at once consigned to the fire. Spray with a weak solution of potassium sulphide—1oz. to 10 gallons of water is recommended. It is difficult, indeed, almost impossible, to cure an attack, but one may do much to prevent a spread of the disease, and, next spring, judicious sprayings at intervals may prevent a recurrence of attack. Present spraying should keep the new growth clean.

PIG-KEEPING.—J. H., Saffron Walden: A very useful and practical work dealing with pigs and pig-keeping, is "Pigs for Profit," by John Walker, 1s. 9d. post free, in cloth, from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.

INSECTS ON CHERRIES.—L. A., Ealing: We very much regret that the little insects escaped during their journey to an entomologist, and we are therefore unable to give you their name. We shall be glad if you will let us know whether you have seen any other rings of eggs on the cherry stems, and whether there is any sign of an attack of small round insects at present.

SINGLE-HANDED GARDENER.—H. H., Buckhurst Hill: A single-handed gardener is a man who, without any assistance, manages and works a garden for his employer. If a man is allowed one lad, or the occasional help of a man, he does not work the garden

BENGER'S Food
assists nature.

It is used mixed with fresh new milk and forms a delicate and nutritive cream which can be enjoyed and assimilated when other foods disagree. It is entirely free from the rough and indigestible particles which produce irritation in delicate stomachs.

Mothers and interested persons are requested to write for Booklet, "Benger's Food and How to Use it." This contains a "Concise Guide to the Rearing of Infants," and practical information on the care of Invalids, Convalescents, and the Aged. Post free on application to Benger's Food Ltd., Otter Works, Manchester.

*** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

single-handed. We find, however, that your rules classify competitors into six divisions, and one of these is for single-handed gardeners having only occasional help. As there is no division specially for the true single-handed gardener, we take it that, for the purposes of your show, this classification applies to all classes for single-handed gardeners. Class 20, taken without reference to clause B of rule 13, would exclude gardeners who have any assistance whatever, and if it was so intended, then the class specification should have been properly worded to meet the case, and rule 13 should have had a further clause added. At present rule 13 governs class 20, and its effect is to handicap gardeners who have no assistance; and, as further showing the curious effect rules and regulations may have when class specifications are not in accord with them, we may point out that a man who has no assistance is, if one wished to split hairs finely, debarred from competing in any but the open classes.

CULINARY PEAS.—T. T., Birmingham: There is no trace of fungus attack in the peas sent, and we therefore can only conclude the damage has been caused by sudden changes of weather, or error in culture. Heavy waterings with cold water before the plants were able to profit by them, followed by a sudden fall of temperature, would so lower the temperature of the soil as to seriously check, if not quite kill the young and tender rootlets. We incline to the belief that the cause must be looked for in some such direction as that indicated.

PEACHES FAILING.—G. B., Dublin: The markings suggest an attack of Peach-spot Mould, but we are having the matter investigated. Kindly send us other examples. Remove and burn all diseased fruits, and maintain a drier and more buoyant atmosphere in the peach house. Spraying is practically impossible at this stage, as it would quite spoil the healthy fruits.

SOIL FOR ROSES.—Staffs: You are fortunate in being able to command plenty of turf. Cut the turves about four inches thick with a spade, and stack them as cut, placing between each layer of turf a good thickness of fresh cow manure, and a free dressing of soot and wood ashes. Such stack will provide material for adding to the rose border in autumn just previous to planting, but it should not be put at the bottom of a 2ft. trench. Use it where the roots will be at once able to take advantage of it.

NAMES OF PLANTS.

M. N., Colchester.—Acer campestre.

J. J., Croydon.—1, Dictamnus fraxinella; 2, Anthericum Liliago.

F. S. R., Horsham.—1, Polygonum cuspidatum; 2, Campanula Mayi.

W. A., Harwich.—1, Bifrenaria Harrisoniæ; 2, Cattleya Mossiæ, a very fair variety.

T. S., Derry.—1, Chionanthus virginicus; 2, Asclepias curassavica; 3, Bellidiastrum Micheli.

J. C., Cirencester.—1, Commelina cœlestis; 2, Tradescantia virginica; 3, Stellaria graminea aurea.

E. P. D., Hertford.—1, Dossinia marmorata; 2, Cypripedium Sedeni; 3, Erica persoluta; 4, E. Cavendishiana.

L. B. A., Taunton.—1, Costus igneus; 2, Tillandsia Lindeni; 3, Sisyrinchium striatum; 4, Rosa rugosa; 5, Plectranthus australis; 6, Quercus Suber.

C. M., North Wales.—Your post-card did not reach us until after we had gone to press, but you will have seen the names, so far as we could give them, on page 506.

WEST'S PATENT GARDEN SUNDRIES have been invented during 25 years of practical experience in horticultural sundries. That by the better cultivation of plants and the pleasure by which gardens are kept in order their expense is doubly repaid. From Seedsmen. Samples and Large Illustrated Catalogue post free. C. E. WEST, Higham Hill, London, N.E.

TRADE NOTE.

Messrs. Mackenzie and Moncur, Lim., of Edinburgh, London, and Glasgow, the hot-house builders, etc., have, we understand, carried out a good deal of work at Dupplin Castle, Dunkeld House, Kinfauns Castle, Pitfour Castle, Ballathie, and Murthly Castle, a matter of considerable interest to our readers, in connection with the descriptive accounts of these and other Perthshire gardens given in our issues of June 27 and July 4.

HEATING APPARATUS for GREENHOUSES. Write for special prices. Give length and width of greenhouse. Catalogue free. Medals awarded 1865, 1881, 1895. J. ATTWOOD, Stourbridge.

THE BEST CABBAGE FOR PRESENT SOWING.

SUTTON'S FLOWER OF SPRING,

Per ounce, 1s., post free.

Read the following:—

"SPRING CABBAGES.—I have made an exhaustive trial in order to test the merits of Flower of Spring versus Ellam's Early Dwarf. These varieties were sown together at two different dates, and were both transplanted in due course, and treated exactly alike in every respect. Out of 3,000 plants 10 per cent. of Ellam's Early Dwarf 'bolted,' while of the same number of Flower of Spring not a single plant has run to seed.

"I have always regarded the latter as the best variety in cultivation, and I am now more than ever convinced of its superiority, not only for its immunity from bolting, but for its evenness of growth and its general good qualities.—James Gibson, Welbeck Gardens."

"Gardeners' Chronicle."

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

SILVER MEDAL, FRANCO-BRITISH EXHIBITION.

GOLD MEDAL, ROYAL BOTANIC SOCIETY.

SILVER CUP, ROYAL HORTICULTURAL SOCIETY

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Roses.

The exhibition of the National Rose Society, which brought crowds of visitors to the gardens of the Royal Botanic Society on the 3rd inst., came very near to establishing a record as far as the Metropolitan rose shows are concerned. If it failed to accomplish this, as was undoubtedly the case, the failure was due to causes wholly beyond the control of the society and the large body of enthusiastic rosarians who take part in the competitions at its shows. There was an immense, varied, and beautiful display of roses, so large a number of visitors as to indicate the largely increased interest that is being taken in the National Rose Society and its work by the flower-loving community, and the exhibition was honoured by the presence of Her Majesty the Queen. The cause of the failure of the exhibition to fully realise the anticipations of those who, for some time, believed it would surpass the most successful of the Metropolitan shows previously held was unquestionably the weather. Until within a fortnight or so of the date of the show the roses were so far favoured by the weather as to justify the anticipations that the rose season would this year be considerably above the average. In consequence of the low temperature that prevailed until the end of April roses were later in starting into growth than usual, and as, generally speaking, there was no severe frosts in May, growers had no occasion to complain of the growth being checked or buds injured by spring frosts, or of the development of the flowers being slow owing to an abnormally low temperature in June. Everything in the rose garden proceeded in the most satisfactory manner until about the middle of June, when the weather changed to tropical conditions, which obtained until the date of the show, and rendered an inspection of the roses less pleasant to the feelings than is usually the case, notwithstanding the precautions that were taken to keep the tents as cool as possible. Roses can bear with impunity a relatively high temperature, provided they have a moderate amount of moisture within reach of their roots, but the great heat experienced in the second half of June found the soil in a comparatively dry state, and was accompanied by brilliant sunshine and easterly winds. As the result of these unfavourable climatic conditions, the blooms of all classes of roses were wanting in substance and staying power, a state of things that made it very difficult for growers to cut the desired numbers, and rendered it quite impossible for them to stage in such manner as to ensure their roses retaining their freshness and beauty for any considerable period on the exhibition stage. It would appear that the so-called summer-flowering roses suffered even more severely from the heat and drought than did the other classes, for they were less plentiful than for several years past, and not a few showed signs of distress before the judging was completed. To the attractions of the garden many of these roses have contributed but little this year, for their season of flowering was very short, and, owing to the rapidity with which the flowers shed their petals, they failed to produce a really satisfactory effect. The behaviour of these roses suggests the desirability of their being planted somewhat sparingly, for under the most favourable conditions their season of flowering is short, and when, as in a season such as the one through which we are passing, conditions are not favourable, the results are far from satisfactory. Hybrid perpetuals, hybrid teas, and teas, although lacking the substance characteristic of well-grown blooms in seasons favourable to their development, were, on the whole, of excellent quality, and formed the great feature of the excellent show. They were not perhaps quite so effective as in some years, owing to the highly-coloured varieties being less numerous; but until the raisers have succeeded in giving us brilliant scarlet and rich crimson roses that will not be affected by great heat and strong sunlight, we must bear with a decrease in highly-coloured roses in hot, dry seasons. With regard to these roses, it must be mentioned as a point of considerable practical importance that the blooms staged in the orthodox boxes retained their freshness and beauty better than did those staged in vases, and thereby fully justified the views of those who hold that, while the decorative aspects of roses should be adequately represented, exhibition boxes should not be abolished. At the National Rose Society's shows the box and vase classes are so admirably balanced that no change appears desirable in their relative proportions, but it does appear desirable that some substitute should be found for the bamboo stands, more especially for the display of a given number of blooms of one variety. The matter is beset with difficulty, and we would suggest that until some receptacle

MR. E. B. LINDSELL,
President of the National Rose Society.

can be found for the display of these blooms in a natural and pleasing manner they should be shown in boxes of the ordinary type. The large bamboo stands are hardly so objectionable for rambling and other garden roses as for exhibition blooms, but for these they are hardly equal to the large vases of metal or earthenware in use. The competition for arches decorated with climbing roses is useful in giving a distinct feature to the exhibition, but it can hardly be said to have accomplished the end the committee had in view when it was initiated. There appears to be a great difficulty on the part of some exhibitors in avoiding overcrowding, and we have now and again, as on this occasion, evidence of the fact that an arch spanning a walk is seen from all sides, and that judges who understand their work give due consideration to this in making their awards. Notwithstanding the drawbacks with which rosarians have had to contend, the exhibition was in every way worthy of the National Rose Society and the large band of rosarians who own allegiance to it.

Mr. E. B. Lindsell occupies so commanding a position among amateur rosarians, and, moreover, is so genial and unassuming in manner, that we have something more than the ordinary degree of pleasure in presenting our readers with his portrait. In this brief reference it is not necessary we should inquire into the motive which induced Mr. Lindsell to devote so much of his leisure to the cultivation of roses, or give particulars of his early efforts in the production of blooms for exhibition. It is sufficient for our purpose to know that he has a strong affection for the rose in its many attributes of beauty, and that for nearly twenty years he has, with but few breaks, been successful in winning the amateurs' challenge trophy offered at the metropolitan exhibitions of the National Rose Society. The first year in which Mr. Lindsell had this trophy awarded to him was in 1890, and during the three following years he was successful in retaining possession of it. In 1894 Mr. S. P. Budd was successful in obtaining the trophy, but in the next year Mr. Lindsell again became its owner. Mr. Lindsell had in 1896 to surrender the trophy to the Rev. J. H. Pemberton, but in 1897, he was again the winner, and from that year until the exhibition held on the 3rd inst., he has been able to retain the championship, notwithstanding the invariable keenness of competition in the trophy class. In addition to his success in the trophy class at the Metropolitan shows, Mr. Lindsell has won the amateurs' jubilee challenge trophy at the Northern show of the National Rose Society no less than ten times, and he must have won during his career as an exhibitor many hundreds of other prizes at the leading exhibitions. From the first Mr. Lindsell has been held in the highest respect by rosarians, and in 1906 the members of the National Rose Society gave practical expression to their esteem by unanimously electing him as their president, a position he has filled with much success.

Amherstia nobilis at Kew.—There is a good example of this handsome tropical tree in the aroid house (No. 1) at Kew, where it has been for at least 30 years. Until about 10 years ago it was planted in a tub, but since then, says the "Kew Bulletin," it has been in the open border, the soil in which receives a certain amount of heat from the boiler chamber immediately below. This plant is 25ft. high, and has a stem 6in. in diameter, with loosely spreading branches. It has flowered more or less freely every year since it was planted out, and this year it has been exceptionally floriferous, carrying 82 large pendulous racemes of bright scarlet and yellow flowers, which were at their best early in June. Several spikes were, as our readers will remember, shown, from Kew, at the recent Temple Show. Amherstia was first introduced from Burma into English gardens through Chatsworth about 60 years ago, and was first flowered in a garden at Ealing in 1849. The Kew tree is probably about 40 years old. In Burma there are trees 40 to 50ft. high, and when in flower they are said to be magnificent, and one of the features of the Royal Botanic Garden at Calcutta is an avenue of these trees. The flowers are used by the Burmese in connection with their religious ceremonies.

Messrs. E. Webb and Sons' etc.—It gives us much pleasure in illustrating on page 538 the remarkably fine collection of vegetables, melons, etc., for which Messrs. E. Webb and Sons, of Wordsley, were awarded a gold medal at the recent flower show, held at the Franco-British exhibition. The collection so admirably depicted in the photographic reproduction,comprised tomatoes, cucumbers, early peas, and beans, cauliflowers, carrots, and other kinds. Nearly 100 varieties were included in the collection, and they were all represented by specimens remarkable for their high state of development. Especially noteworthy also were the many finely ripened melons that were associated with the vegetables. At the recent Hanley exhibition this firm was awarded a silver cup and gold medal for an exceptionally fine exhibit comprising sweet peas, melons, and vegetables, and similar high honours have fallen to them at Wolverhampton.

R. H. S. Committees and Judges at Holland Park.—The Council of the Royal Horticultural Society entertained the judges, the members of the various committees, and the Press to luncheon on the occasion of the Holland Park Show. The attendance was a large one, under the presidency of Sir Trevor Lawrence, Bart. Hearty thanks were accorded Mary Countess of Ilchester for the loan of Holland Park for the show, and on behalf of the Council, Sir Trevor thanked the committees for their services so continuously and ably rendered, and Sir Albert Rollit proposed the toast of "Judges and Exhibitors." Mr. T. Challis, of Wilton House Gardens, Salisbury, Mr. W. Poupart, Twickenham, and Mr. J. Cheal, Crawley, responded, the latter on behalf of the exhibitors. We learned during the progress of the speeches that the Council is paying the travelling expenses of the judges this year, a departure that is greatly appreciated by those who come many miles, hundreds in some cases, to fulfil their duties.

A Big Mushroom.—A daily contemporary records the find of a big mushroom at Keady, co. Armagh, by Mr. Patrick Molloy. The size of the mushroom is given as 4ft. in circumference, and the weight as 11½lbs. What a whopper!

Begonia cathayana, a handsome Chinese species, collected by Dr. Henry, introduced by Mr. A. K. Bully, of Ness, Neston, Cheshire, and distributed by Messrs. Sander and Sons, St. Albans, is the subject of a double page illustration in the "Botanical Magazine" of July; the leaves are green above and crimson below, and the vermilion coloured flowers are borne in pendulous racemes. In the same issue are illustrations of Cœlogyne perakensis, an erect growing, green flowered species; Didymocarpus cyanea, a pretty, dwarf, blue flowered Gesneriad, collected at Kasum, Malay Peninsular, by Mr. C. Curtis; Olearia ramulosa communis, a pretty Australian shrub with white flowers, suitable for a greenhouse; and Rhododendron Mariesi, a deciduous Chinese species found at Ichang by Dr. Henry, it has pink, purple spotted flowers, and may probably prove hardy in the southern counties.

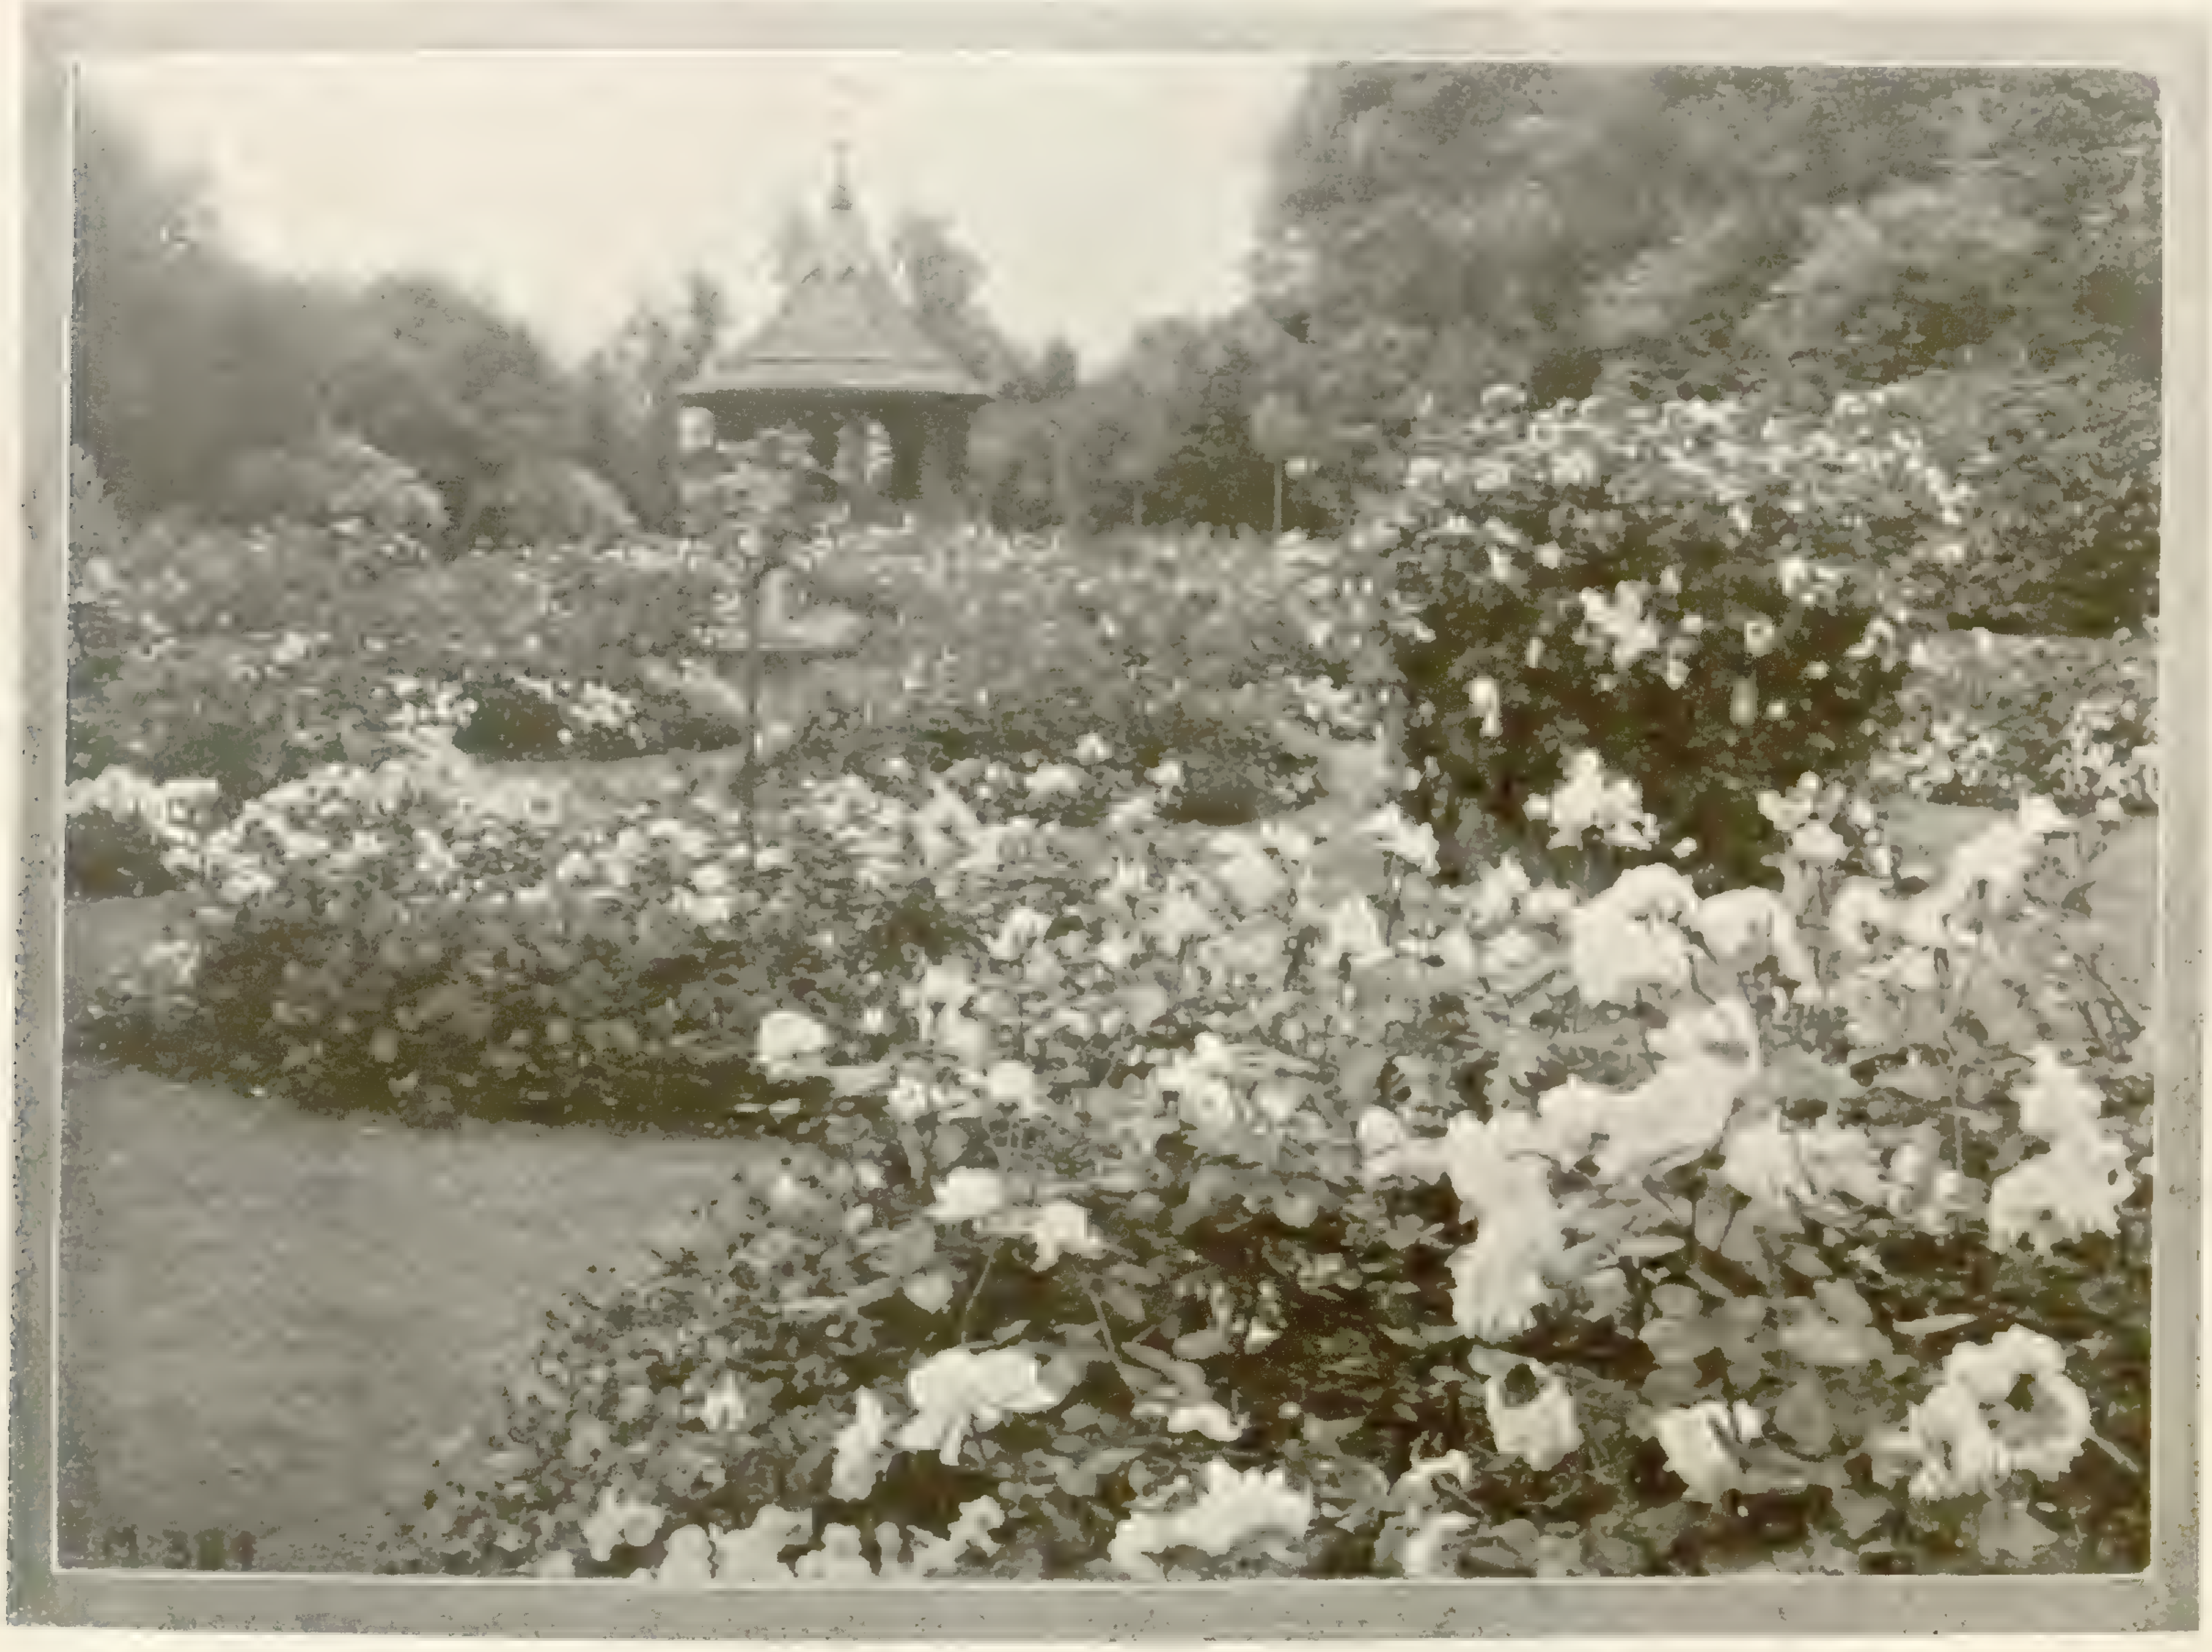
The "Gardeners' Magazine" in Russia.—Our readers, and especially those who advertise in our columns, will be interested to learn that the Gardeners' Magazine not only reaches all parts of the United Kingdom, the Colonies, the United States, India, and the nearer Continental countries, but that it also reaches the further parts of Russia. Mr. H. N. Ellison, of Bull Street, West Bromwich, sends us a letter received from Zaraisk, in the province of Ryazan, in answer to his advertisement of begonias and gladioli. This is another proof of the wide circulation of the Gardeners' Magazine and its value as an advertising medium.

Sherwood Cup Competition.—It had been arranged that the Sherwood Cup, presented by Mr. N. N. Sherwood, V.M.H., should be competed for at the Holland House Show on July 7, and the class was for twenty-four bunches of roses, with their own foliage, shown in vases by amateurs. Remembering how many keen amateur rosarians there are it was regrettable that only two entered for this handsome and important prize, and it is a matter of still further regret that neither of these exhibits was worthy of the award. We expected a fine competition among the leading amateur rosarians, and were, therefore, grievously disappointed.

Playing Field at Plaistow.—On Saturday afternoon last the Mayor of West Ham opened a new seven-acre playing field at Plaistow. This open space has been leased to the Rev. T. Given-Wilson, vicar of St. Mary's, by the Gas Light and Coke Company, and should prove of inestimable value in this crowded district. All the work of preparing the site, and of building the pavilion and water tower, has been done by the unemployed of the district, so that Plaistow has benefited in every way by the enterprise of the vicar.

Effect of Ammonium Salts on Flora.—Dr. Voelcker showed at the recent R.H.S. Scientific Committee, a fern which had developed under curious circumstances. A series of drain pipes filled with soil, and each covered at the base with a perforated slate, below which a glass funnel had been fixed in order to catch the drainage water, had been kept for two years, during which time through some ammonium sulphate had been passed, through others ammonium chloride, others nitrate of soda, and others distilled water. The ferns had grown through the perforation of the slate into the funnel, which was exposed to light, only in those cases where ammonium salts had been passed through the soil. This was apparently due to a difference in the reaction of the soil in the different cases. It had been noted that continued manuring of the soil with ammonium salts finally resulted in a sterile condition, and before that the appearance of certain algæ upon the soil different from those found under other circumstances. This sterility can be overcome by the addition of lime to the soil, and in cases where only a small bulk of soil is in use by stirring the soil up with distilled water and allowing it to settle.

R.H.S. Examination in Horticulture.—The annual examination in the principles and practice of horticulture was held on April 8 last, when 151 candidates entered. Twenty-seven candidates, or upwards of 18 per cent. of the whole number, were placed in the first class. Sixty-eight, or nearly 46 per cent., were placed in the second class. Fifty-two, or upwards of 34 per cent., were placed in the third class. The corresponding percentages in 1907 were: First class, 14; second class, 40; and third class, 46. Of the questions on the principles, according to the report of the examiners (Rev. G. Henslow, V.M.H., and Mr. J. Douglas, V.M.H.), by far the majority almost confined themselves to the first three questions on physiology. In the majority of cases these were answered very well. Other questions attempted were generally rather imperfectly treated. Although none of the candidates obtained the highest number of marks obtainable in the operations and practice division, the answers were, generally speaking, better than in any previous year. The question referring to the uses of garden tools, etc., was more frequently and well answered; so also was that referring to the laying out of a new garden, and the preliminary work pertaining thereto. Several candidates failed to obtain the number of marks commensurate to their abilities, owing to (a) their not timing their work, and by answering three questions only, instead of four; (b) one candidate answered six questions, another seven, and yet another eight, in one division, notwithstanding that it is clearly stated, "Eight questions only may be answered, four from Division A, and four from Division B." Candidates should also be as concise as possible, the one that fills the greatest number of pages may be very far from gaining the highest number of marks, but nearly all the candidates kept better to the details of the questions than in previous years.



A VIEW IN THE ROSE GARDEN OF THE PLEASAUNCE, OVERSTRAND, THE MARINE RESIDENCE OF LADY BATTERSEA.

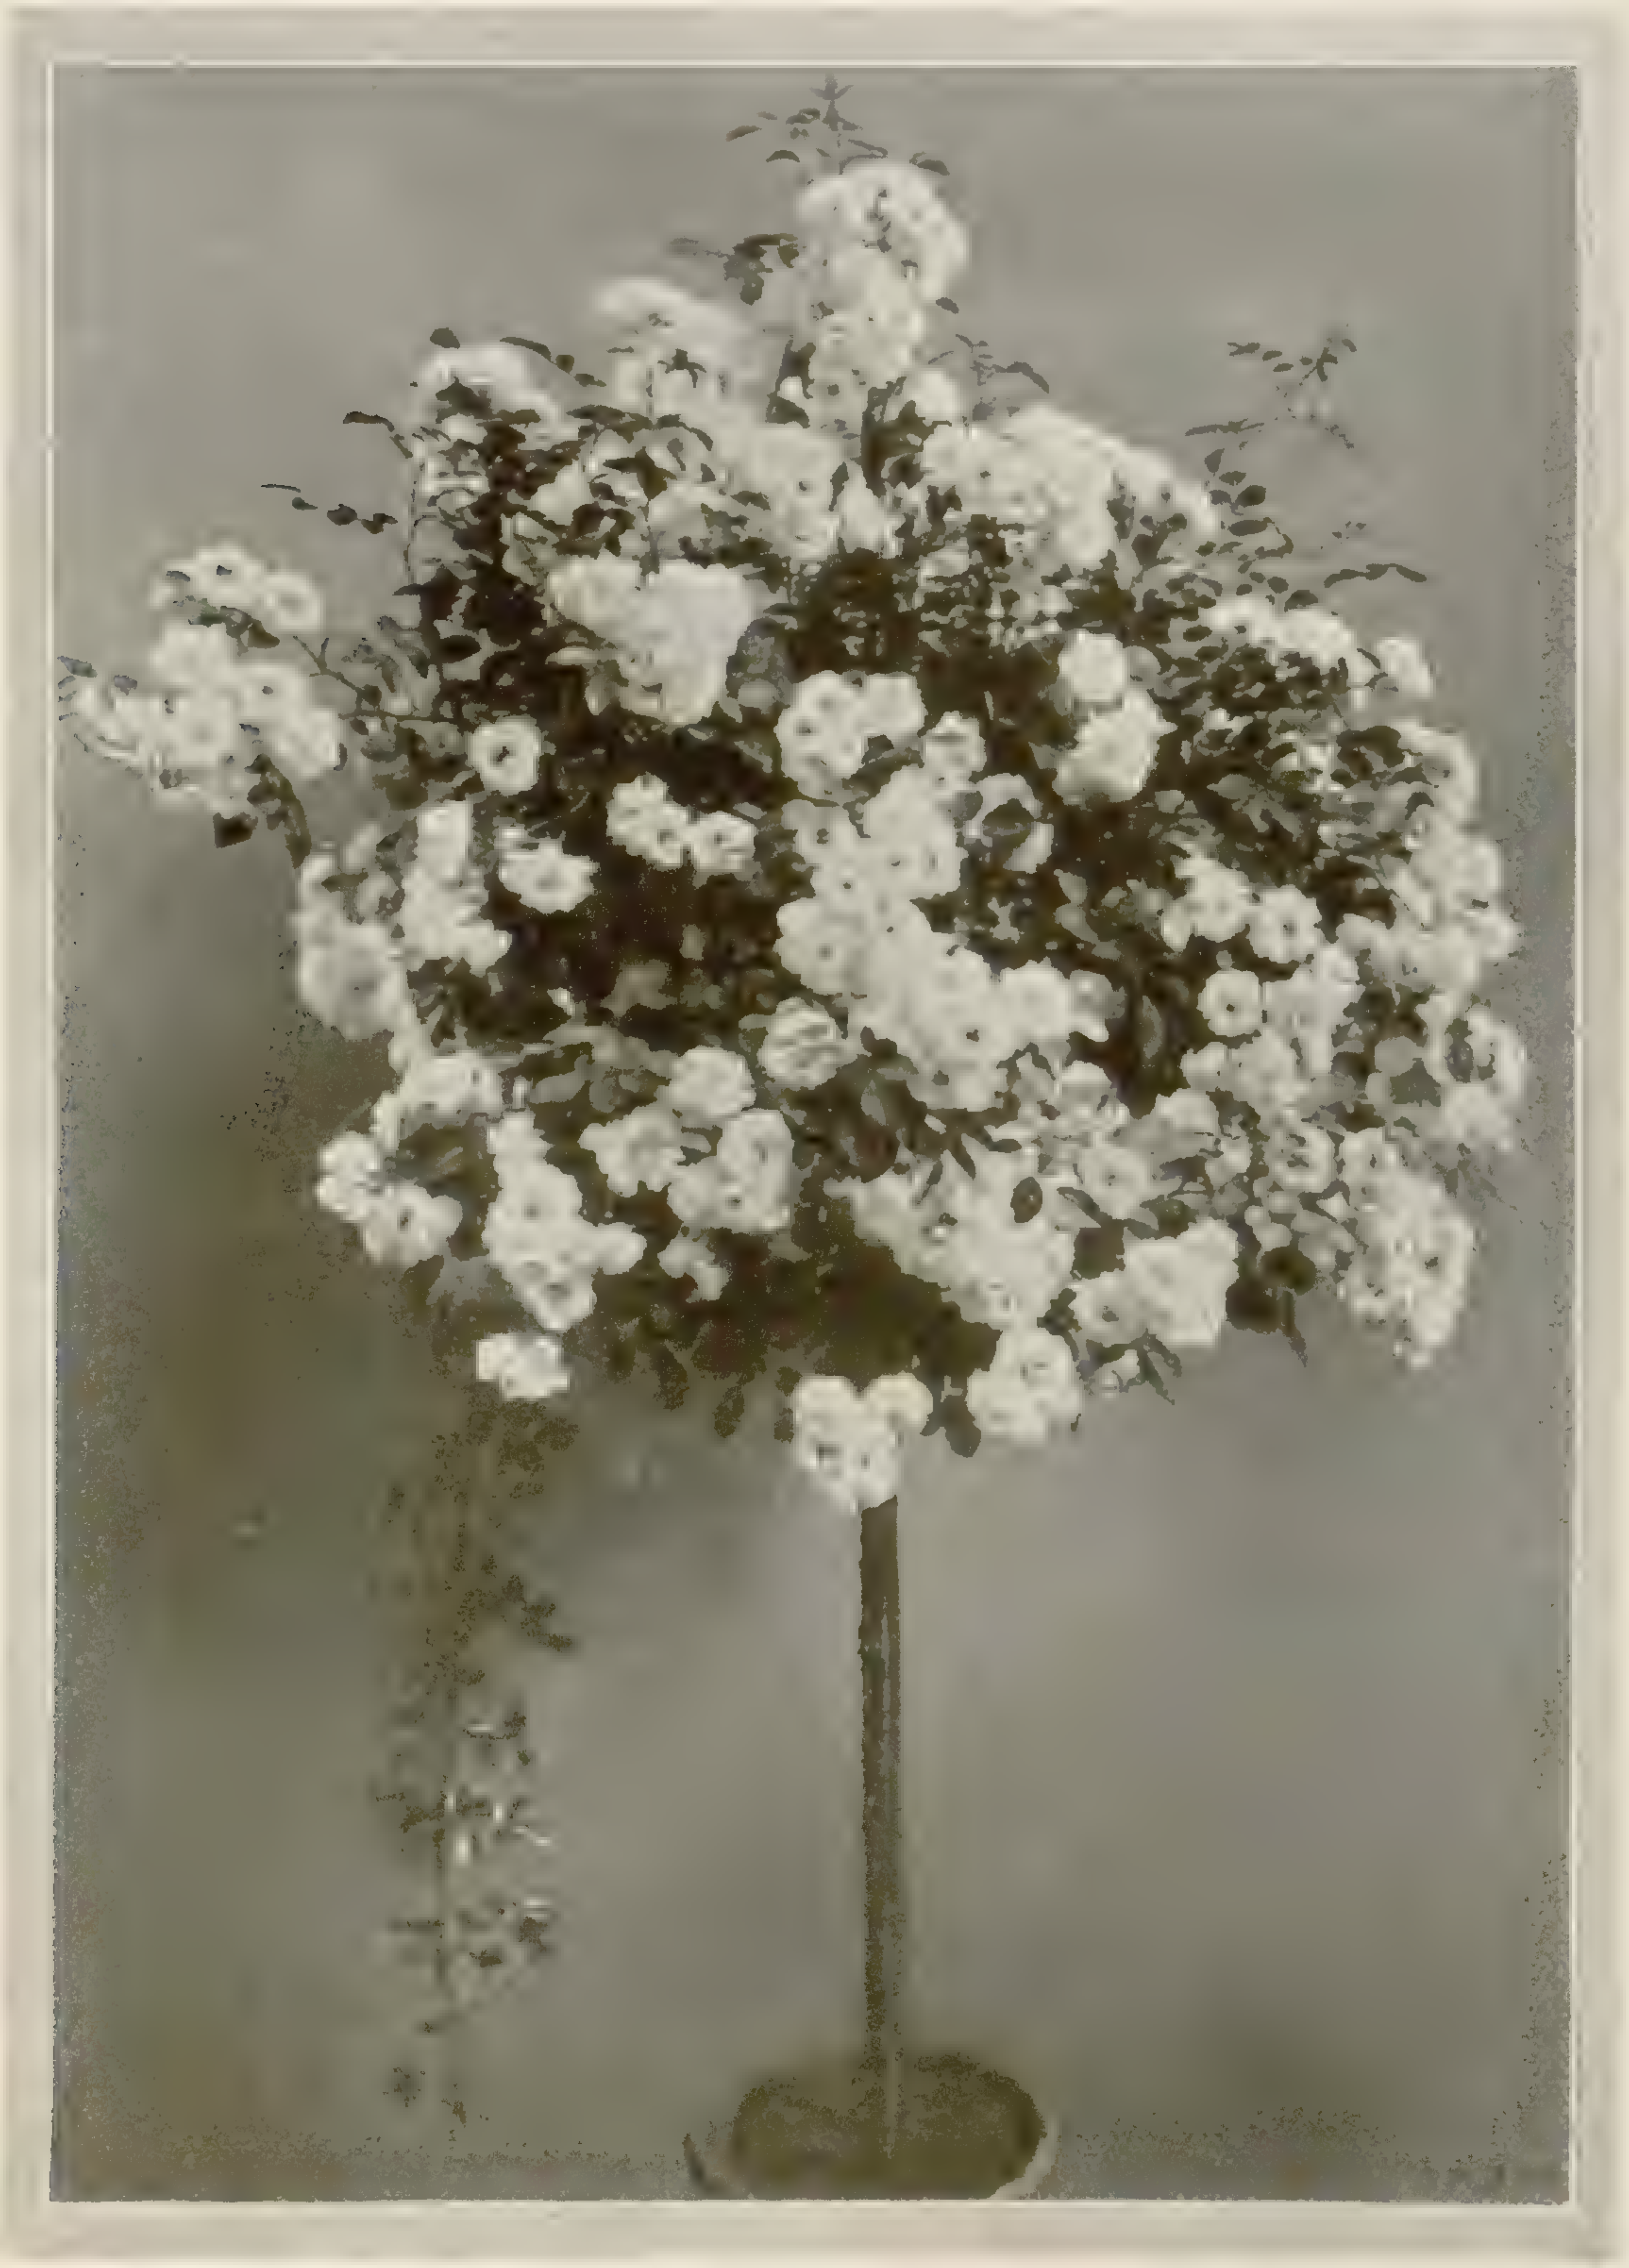
Oxford Gardeners' Visit to Heythrop Park.—The beautiful gardens and grounds of Heythrop Park, Chipping Norton, were thrown open to the members of the Oxford Gardeners' Association a few days ago, by the kindness of Albert Brassey, Esq. Under the guidance of Mr. W. B. Jeffreys, the head gardener, the members inspected the various departments, the rock garden and fine old trees attracting considerable attention. The visit proved a most enjoyable and instructive one.

The Value of Parks and Open Spaces.—In a leader drawing attention to the beauty of the existing public parks in the United States, and making a spirited appeal for more and larger parks, our American contemporary "Gardening," says: Look at the millions that London and other old world cities are spending now to break up the congested districts and allow the poorest children to run about upon land worth hundreds of dollars a square yard, simply because in the days gone by people were too near sighted to see that these towns were growing and that every square inch of available land would soon be covered with houses and factories. Such people look upon parks as a means of exploiting horticultural or gardening interests, whereas there is no single item of civic expenditure that gives so much pleasure to so many people as the parks systems. The horticultural end of it is entirely subservient to the pleasures of visitors. The fine shrubberies and open lawns are there not for the glorification of the gardener but for the public to enjoy and as playgrounds for everybody, young and old and at all seasons of the year.

ROSES BY THE SEA.

Roses are not usually included in lists of deciduous shrubs that are prepared with special reference to their adaptability to the conditions that obtain on the sea coast; and it is not desirable they should have a place in the first line of coastal defences. Yet they grow vigorously and produce an abundance of blooms of high quality when grown within the influence of the sea breezes. We might give many examples of this, but it will suffice to mention one or two instances. One unquestionable proof is to be found in the gardens of Westcliff-on-Sea, where roses are grown largely and are everywhere in the finest possible condition. Here no special protection is provided, as the rising ground on the north and east affords all the shelter from cold winds in spring that is necessary. Still more remarkable is the proof found in the gardens of The Pleasaunce, the marine residence of Lady Battersea at Overstrand. The gardens are within a few hundred yards of the cliffs, which rise to a height of 80 or 90 feet, and have practically speaking nothing between them and the arctic regions except the North Sea. That part of the grounds in which the rose garden has been formed is sheltered on the north and east side by a broad belt of deciduous and evergreen trees, and thus protected from the north and easterly winds which sweep across this part of Norfolk with great force during the spring months, all kinds grow luxuriantly and yield a rich harvest of finely developed blooms. The illustration herewith very clearly indicates the manner in which roses grow and bloom on these high wind-swept cliffs, when they have the advantage of good culture and an effectual screen on the seaward side. Good culture is an important factor in the growth of roses by the sea, and in the gardens of The Pleasaunce the beds were prepared by the liberal addition of fresh loam and thoroughly decayed manure and deep digging. Since the roses have become established the fertility of the soil has been maintained by applications of manure at such intervals as appeared to be necessary, having regard to the growth of the roses. The varieties include such fine roses as Kaiserin Victoria, Madame Abel Chatenay, Lady Battersea, Caroline Testout, and Marie Van Houtte, which bloom freely and continuously throughout the season. Each bed is devoted to one variety, and the beds are margined with violas. This beautiful rose garden is of special interest as evidence of the success with which roses can be grown by the sea, and of Mr. Naylor's skill as a cultivator.

G.



STANDARD SPECIMEN OF RAMBLING ROSE LADY GODIVA.
Grown by Messrs. Paul and Son, Cheshunt. Flowers, pale yellow.

Raspberries are now fast ripening, and the crop is an excellent one. Mulching over the roots with manure, and a few soakings of water or liquid manure, will help a stronger growth for next year's fruiting. Our loganberries are looking well, and the crop will be fine; this is a fruit which ought to be more grown. Ours are planted in rows on a rather light soil, and the growth is medium.—H. Markham.

THE MALE FERN FOR INDOOR DECORATION.

During the summer months there is often a difficulty in finding suitable plants to fill fireplaces and dark recesses in rooms, as the absence of sunlight usually quickly kills most things we grow for this purpose. Some six years ago I had occasion to find plants to form a bank in a recess, and having a fine lot of Lastrea Felix-mas available I lifted and potted as many as I required, and utilised them in making a bold, green, cool-looking mass. The effect was finer than I could have anticipated, and the plants kept in good form till well into the autumn. Since then I have profited by the result, and annually lifted and potted the most suitable plants of this fern to meet my requirements. This has enabled me to dispense with the cultivation of more tender and less suitable subjects, which had been employed for such work previously. Labour has, therefore, been economised, and decidedly better results obtained.

My mode of operation is to grow the ferns on a border on the north side of a wall, and in similarly shaded positions, and when the young fronds are fully developed, which is about the middle of June, to lift and pot, or tub as many as I require of those most suitable for my purpose. When lifting, I preserve all the roots I can, but usually shake a certain amount of soil from them, in order that they may go into small pots. The compost they seem to like is one consisting of equal parts of leaf-mould and loam. I pot fairly firm, and then soak the plants with water, stand them in a shaded position for a couple of days, and give them an occasional dewing with a syringe. After the time stated they are fit for the house, where they look well, and produce a most pleasing effect all through the summer if well supplied with water.

In autumn, when they show signs of decay, I turn them out of their pots and replant in their former quarters. The following June other plants are employed to serve the same purpose as those of the previous year, so that after a summer in the house they are allowed to grow out of doors for one or two years before being again utilised for indoor decoration.

Having proved the value of the male fern for indoor decorative purposes during the summer months I have drawn the attention of some of my friends to it, and now am not alone in growing it for room decoration. Besides filling fireplaces and dark recesses, where the sun does not reach them, they also do well in the sunny spots, only in such positions they need a deal of water. For town houses this fern will be found most useful, as by employing it instead of palms, equal, if not better results, will be obtained, and the lives of many palms will be saved. Hibernia.

NEW RAMBLING ROSE, LADY GODIVA.

For some years past Messrs. Paul and Son, of Cheshunt, have devoted special attention to the raising of rambling roses, and in this branch of their work have achieved a degree of success that might well be described as exceptional. One of the latest of their additions to the rambling roses is Lady Godiva, which, grown in standard form, contributed materially to the effectiveness of the fine group arranged by the firm at the Temple Show. The growth, as in the case of other of the ramblers, is vigorous, and the elegant pale yellow flowers are profusely produced. Grown in pots as in the case of the example illustrated herewith, the variety is extremely useful for conservatory decoration, and in the open it forms handsome weeping standards, while suitable for the same purposes as other roses of its class.

The Sand Myrtle.—The little sand myrtle, Leiophyllum or Ledum buxifolium, is one of the dwarfer shrubs so dear to the heart of the lover of alpines, and a small group of plants in the lower part of the rock garden generally appeals to him if they are in perfect health. When this is so the sand myrtle is about six inches high, and has all its branches adorned with small leaves, bearing some resemblance to miniature box foliage, and the flowers, which are in small bunches, are white. It is a pretty little subject which deserves to have its likings studied a little, and as they are not very exacting many can supply it with the treatment it prefers. This is to give it a place in sandy peat soil, but if this cannot be obtained, a compost can be made up of well-decayed leaf-soil, a little loam, and some sand. The position ought not to be too dry, as it suffers much from drought, this being the cause of frequent losses of this plant when placed on dry parts of the rockery. It is a native of New Jersey and Virginia, whence it was introduced in 1736.—S. Arnott.

THE BEST CLIMBING ROSES.

Two years ago Mr. W. E. Nickerson, of Cambridge, Massachusetts, U.S.A., who takes a keen interest in the development of roses specially adapted for general culture in the garden, presented the National Rose Society with three five-guinea silver cups; and these were, in accordance with the wishes of the donor, awarded to the raisers of the best H.P., the best H.T., and the best T. for general cultivation, which had been sent out in 1900 or subsequent to that year. The varieties for which the awards were made were Frau Karl Druschki, Dean Hole, and Madame Jules Gravereaux respectively. In order to still further encourage the raising of roses specially adapted for general cultivation, and to assist the smaller growers in selecting the best varieties for gardens, Mr. Nickerson last year generously placed at the disposal of the society twelve silver cups of the same value as those he had previously given. In accordance with Mr. Nickerson's wishes, the competition was arranged in three divisions, each to contain four classes. The first of the divisions was for climbing roses blooming in clusters, the second for climbers blooming more or less singly, and the third for dwarf roses. The four classes in each division were for shades of crimson, shades of pink, white or pale blush, and shades of yellow. The members of the committee, with other leading rosarians in this country and elsewhere, were invited to mark on the voting papers with which they were supplied, the variety in each of the twelve classes that, in their opinion, best complied with the conditions laid down. No restriction was imposed either as regards the age of the variety or the class to which it belonged. Eighty-three voting papers were returned, with the result that the following roses obtained a first, second, or third place in the ballot.

Climbing Roses Blooming in Clusters.

Turner's Crimson Rambler.—This fine rose, which has enjoyed, and deservedly so, a high degree of popularity during the past fifteen years, obtained first place with 33 votes in the class for shades of crimson. As is well known, this effective climbing polyantha was introduced from Japan and distributed by Mr. Charles Turner, who placed it in commerce in 1893. Notwithstanding the large number of rambling roses that have been introduced since Crimson Rambler made its appearance, it still remains the finest of the ramblers with crimson flowers. It was at one time thought by some rosarians that Philadelphia Rambler would prove a formidable rival, but it has not done so. The last-named has more richly coloured and finely formed flowers, but they are not so freely produced, a point of considerable importance in the case of a garden rose.

Gruss an Teplitz, H.T.—This attractive H.T. was second in the class for crimson roses with 22 votes. It was raised by Geschwind, and distributed in 1897. The flowers are rather large and of a brilliant crimson hue, and the growth is so vigorous as to render it of much value for pillars and hedges, while it is admirably adapted for culture in bush and standard form.

Hiawatha, Wich.—One of the best known and most attractive of the single Wichuraiana roses, and of much value for arches, pergolas, pillars, weeping standards, and indeed for all purposes for which the roses of its class are suited. The flowers are bright crimson, with white centre. Raised by Mr. M. H. Walsh, and distributed in 1905, it obtained the third place in the class for crimson roses, with 16 votes.

Dorothy Perkins, Wich.—The deservedly high degree of popularity this beautiful rambler so deservedly enjoys, was indicated by it being placed first for pink roses with 52 votes. The raisers were Messrs. Jackson and Perkins, and the year of introduction 1901. Vigorous in growth and profuse in blooming, this variety is well suited for pergolas, arches, screens, standards, and for trailing over walls, and it has the advantage of yielding of its wealth of blossom after most of the ramblers have flowered.

Blush Rambler, Cl. Poly.—A charming single variety, which was placed second in the class for pink roses, with eight votes. Raised by Messrs. B. R. Cant and Son, and distributed in 1903. The flowers are blush-coloured, and produced in large clusters. Well suited for arches, pergolas, screens, and hedges, and tall standards.

Minehaha, Wich.—A beautiful variety, that obtained the third place in the class for pink roses with six votes. It was raised by Mr. H. M. Walsh, and introduced in 1907. The flowers are double, deep pink, and freely produced. Like other of the Wichuraiana roses, it has a vigorous habit and is well suited for arches, pergolas, screens, and tall standards.

Climbing Aimèe Vibert, N.—This beautiful noisette was placed first for white climbers with 19 votes, and it is not surprising it should have obtained a premier position. The typical variety, which is of dwarf growth, was raised by Vibert, and distributed in 1828, and the climbing form originated as a sport, and was fixed by Curtis, who distributed it in 1841. Remarkable alike for its vigorous habit, handsome foliage, and freedom of flowering, it is not surprising that it should have maintained a high position among white climbers. It is admirably adapted for pergolas, screens, and tall standards, and of quite exceptional value for walls of houses, and especially of houses in suburban districts where the conditions are not specially favourable for roses. The fine specimen herewith illustrated embellishes the walls of the residence of Mrs. Picton at Kew.

Félicité et Perpetué, Evergreen. — This useful rose, which was raised by Jacques, and introduced as far back as 1828, has cream-white flowers, and is useful for all purposes for which a hardy, vigorous-growing climber is suitable. It was second for white climbers with 15 votes.

ROSE CLIMBING AIMEE VIBERT.

Awarded the Nickerson Cup as the best white climbing rose flowering in clusters. This specimen is growing against a villa residence at Kew.

Bennett's Seedling, Ayrshire.—A hardy and useful hardy rose, raised by Bennett, and introduced in 1840. It was placed third in the class for white climbers with 10 votes, and is useful for pergolas, fences, arches, and tall standards.

Alister Stella Gray, N.—A beautiful climbing rose, raised by Mr. A. Hill Gray, and placed first in the class for yellow climbers with 40 votes. It was distributed in 1894, and has steadily gained in favour since that year. The flowers are light yellow, deeper in the centre, and produced in great profusion during the summer and in smaller numbers in the autumn. The illustration of the splendidly-grown specimen in the gardens of Warnham Court, Horsham, renders description of the characteristics of this fine rose unnecessary.

Claire Jacquier, Cl. Poly.—A charming variety that obtained second place in the class for yellow roses with thirteen votes. It was raised by M. Bernaix, and distributed in 1888, and has nankeen yellow flowers. It is vigorous and elegant in growth, but a trifle tender.

Aglaia, Cl. Poly.—A strong-growing climber, third in the class for yellow roses with 12 votes. It was raised by Mr. Lambert, introduced in 1896, and has pale yellow flowers; vigorous in growth, and free in blooming when well established. For pergolas, screens, and tall standards, it has much to recommend it.

Climbing Roses Blooming More or Less Singly.

Ards Rover, H.P.—This fine dark rose was raised by Messrs. A. Dickson and Sons, and introduced in 1894. The flowers are rich crimson, and freely produced, and the growth is vigorous. Valuable for pillars, walls, and trellises.

ROSE ALISTER STELLA GRAY.

Awarded the Nickerson Silver Cup as the best yellow climbing rose flowering in clusters. This finely-flowered specimen is growing in the gardens of Warnham Court, Horsham.

Reine Olga de Wurtemburg, H.T.—A much appreciated rose that obtained second place in the class for crimson climbers with 18 votes. M. Nabonnand was the raiser, and 1881 the year of introduction. Vigorous in growth, it has handsome foliage that is nearly evergreen, and light crimson flowers that are freely produced, and effective in colour. Equally suitable for arches, pillars, pergolas, screens, and walls.

Longworth Rambler, H.T.—A useful variety, placed third among the crimson climbers with 16 votes. It is robust in growth, has light crimson flowers, and blooms freely in the autumn. A good suburban rose, and well suited for all the forms in which climbing roses are usually grown. Raised by M. Liabaud, and introduced in 1888.

Climbing Mrs. W. J. Grant, H.T.—A vigorous-growing form of Mrs. W. J. Grant, obtained by Messrs. E. G. Hill and Co. as a sport, and introduced in 1899. It was placed first for pink climbers with 17 votes, and is well suited for pillars, and a good rose for pegging down.

Climbing Caroline Testout, H.T.—A robust form of this popular rose, which was placed second in the class for pink climbers with 17 votes. The variety originated as a sport, and was introduced by M. Chauvry, in 1902. A fine wall and pillar rose.

Papillon, T.—Raised by Nabonnand, and introduced in 1882. This attractive rose obtained third place among pink roses with 13 votes. A useful rose for walls and pillars, and makes an effective bush.

Madame Alfred Carrière, H.N.—A very fine white climber, which obtained premier position in its class with 62 votes. The growth is vigorous, and the variety is well suited for arches, pergolas, and walls, and can be successfully cultivated in beds under the pegging down system. Raised by M. Schwartz, and introduced in 1879.

Una, S.—A remarkably beautiful single variety, which was placed second for white climbers with 11 votes. Raised by Messrs. W. Paul and Son, and introduced in 1900. A fine rose for hedges and screens and also for lawn groups.

Macrantha, S.—A beautiful flesh-coloured single rose, introduced quite early in the last century. It was third in the class for white and blush-coloured roses with six votes. This species forms a handsome bush.

William Allen Richardson, N.—Raised by Veuve Ducher, and introduced in 1878, this free blooming rose soon attained to a high degree of popularity, and obtained premier position in the class for yellow climbers with 23 votes. One of the best of pillar and wall roses; the colour orange-yellow, with light margin.

Gloire de Dijon, T.—This fine old rose, raised by M. Jacotot, and introduced in 1850, has enjoyed a high degree of popularity, and was placed second for yellow climbers with 13 votes. As so well known, it is exceedingly useful for pillars, walls, and standards, and pegged down it is attractive in beds.

Madame Jules Gravereaux, T.—A fine rose raised by Messrs. Soupert and Notting, and introduced in 1901. The flowers are large and finely formed; the colour chamois-yellow, suffused light rose in the centre. Although placed third for yellow roses with 11 votes, the variety should be largely grown. It is well suited for walls, pillars, and standards, and for culture in beds; while possessing the attributes of a good garden rose, the blooms are of exhibition quality.

V.

A BEAUTIFUL NEW BRIAR ROSE.

Prominent among the new roses that have of late been presented to public notice is the beautiful briar Refulgence, which the raisers, Messrs. William Paul and Son, submitted to the Floral Committee of the Royal Horticultural Society on June 23, when an Award of Merit was made in its favour. We have already described this variety, but in giving the accompanying illustration we would mention that it has a robust habit, and is remarkably profuse in flower production, two characteristics that render it of much value in the garden. The semi-double flowers are three or more inches in diameter, and have stout petals; the colour is brilliant crimson with whitish centre. In addition to its other good qualities, this fine briar is delightfully fragrant and has the promise of proving one of the most useful of the many excellent roses that have originated in the Waltham Cross Nurseries.

CANTERBURY BELLS IN THE CONSERVATORY.

Canterbury bells form delightful subjects for conservatory and house decoration in the early season if brought along under glass. I came across an article the other day giving elaborate detail as to how to produce plants for this purpose from seeds, and the advice given was to grow in pots from the commencement. I am not at one with the writer of that article, as the method undoubtedly means a considerable amount of time and labour wasted.

The method I adopt, and I have utilised Canterbury Bells largely for the purpose indicated, is to lift young and vigorous plants that possess a good crown or crowns, in autumn, and pot them in suitably sized pots, when they are either plunged in the open garden, or, if there is available space, wintered in cold frames, and even [illegible] there is no advantage gained. It suffices to plunge them and forget all about them until it is time to transfer them to the genial conditions of a warm greenhouse, when they readily respond by producing a wealth of inflorescence.

They are satisfactory when lifted early in February, potted and kept close in a cold frame for two or three weeks prior to their introduction into warmth, and the only difference is they are slightly, and very slightly less long lived as regards their season of beauty. Both liquid manure and overhead syringings will be found [illegible] beneficial.

Walter H. [illegible]

AMONG THE ALPINE FLOWERS.

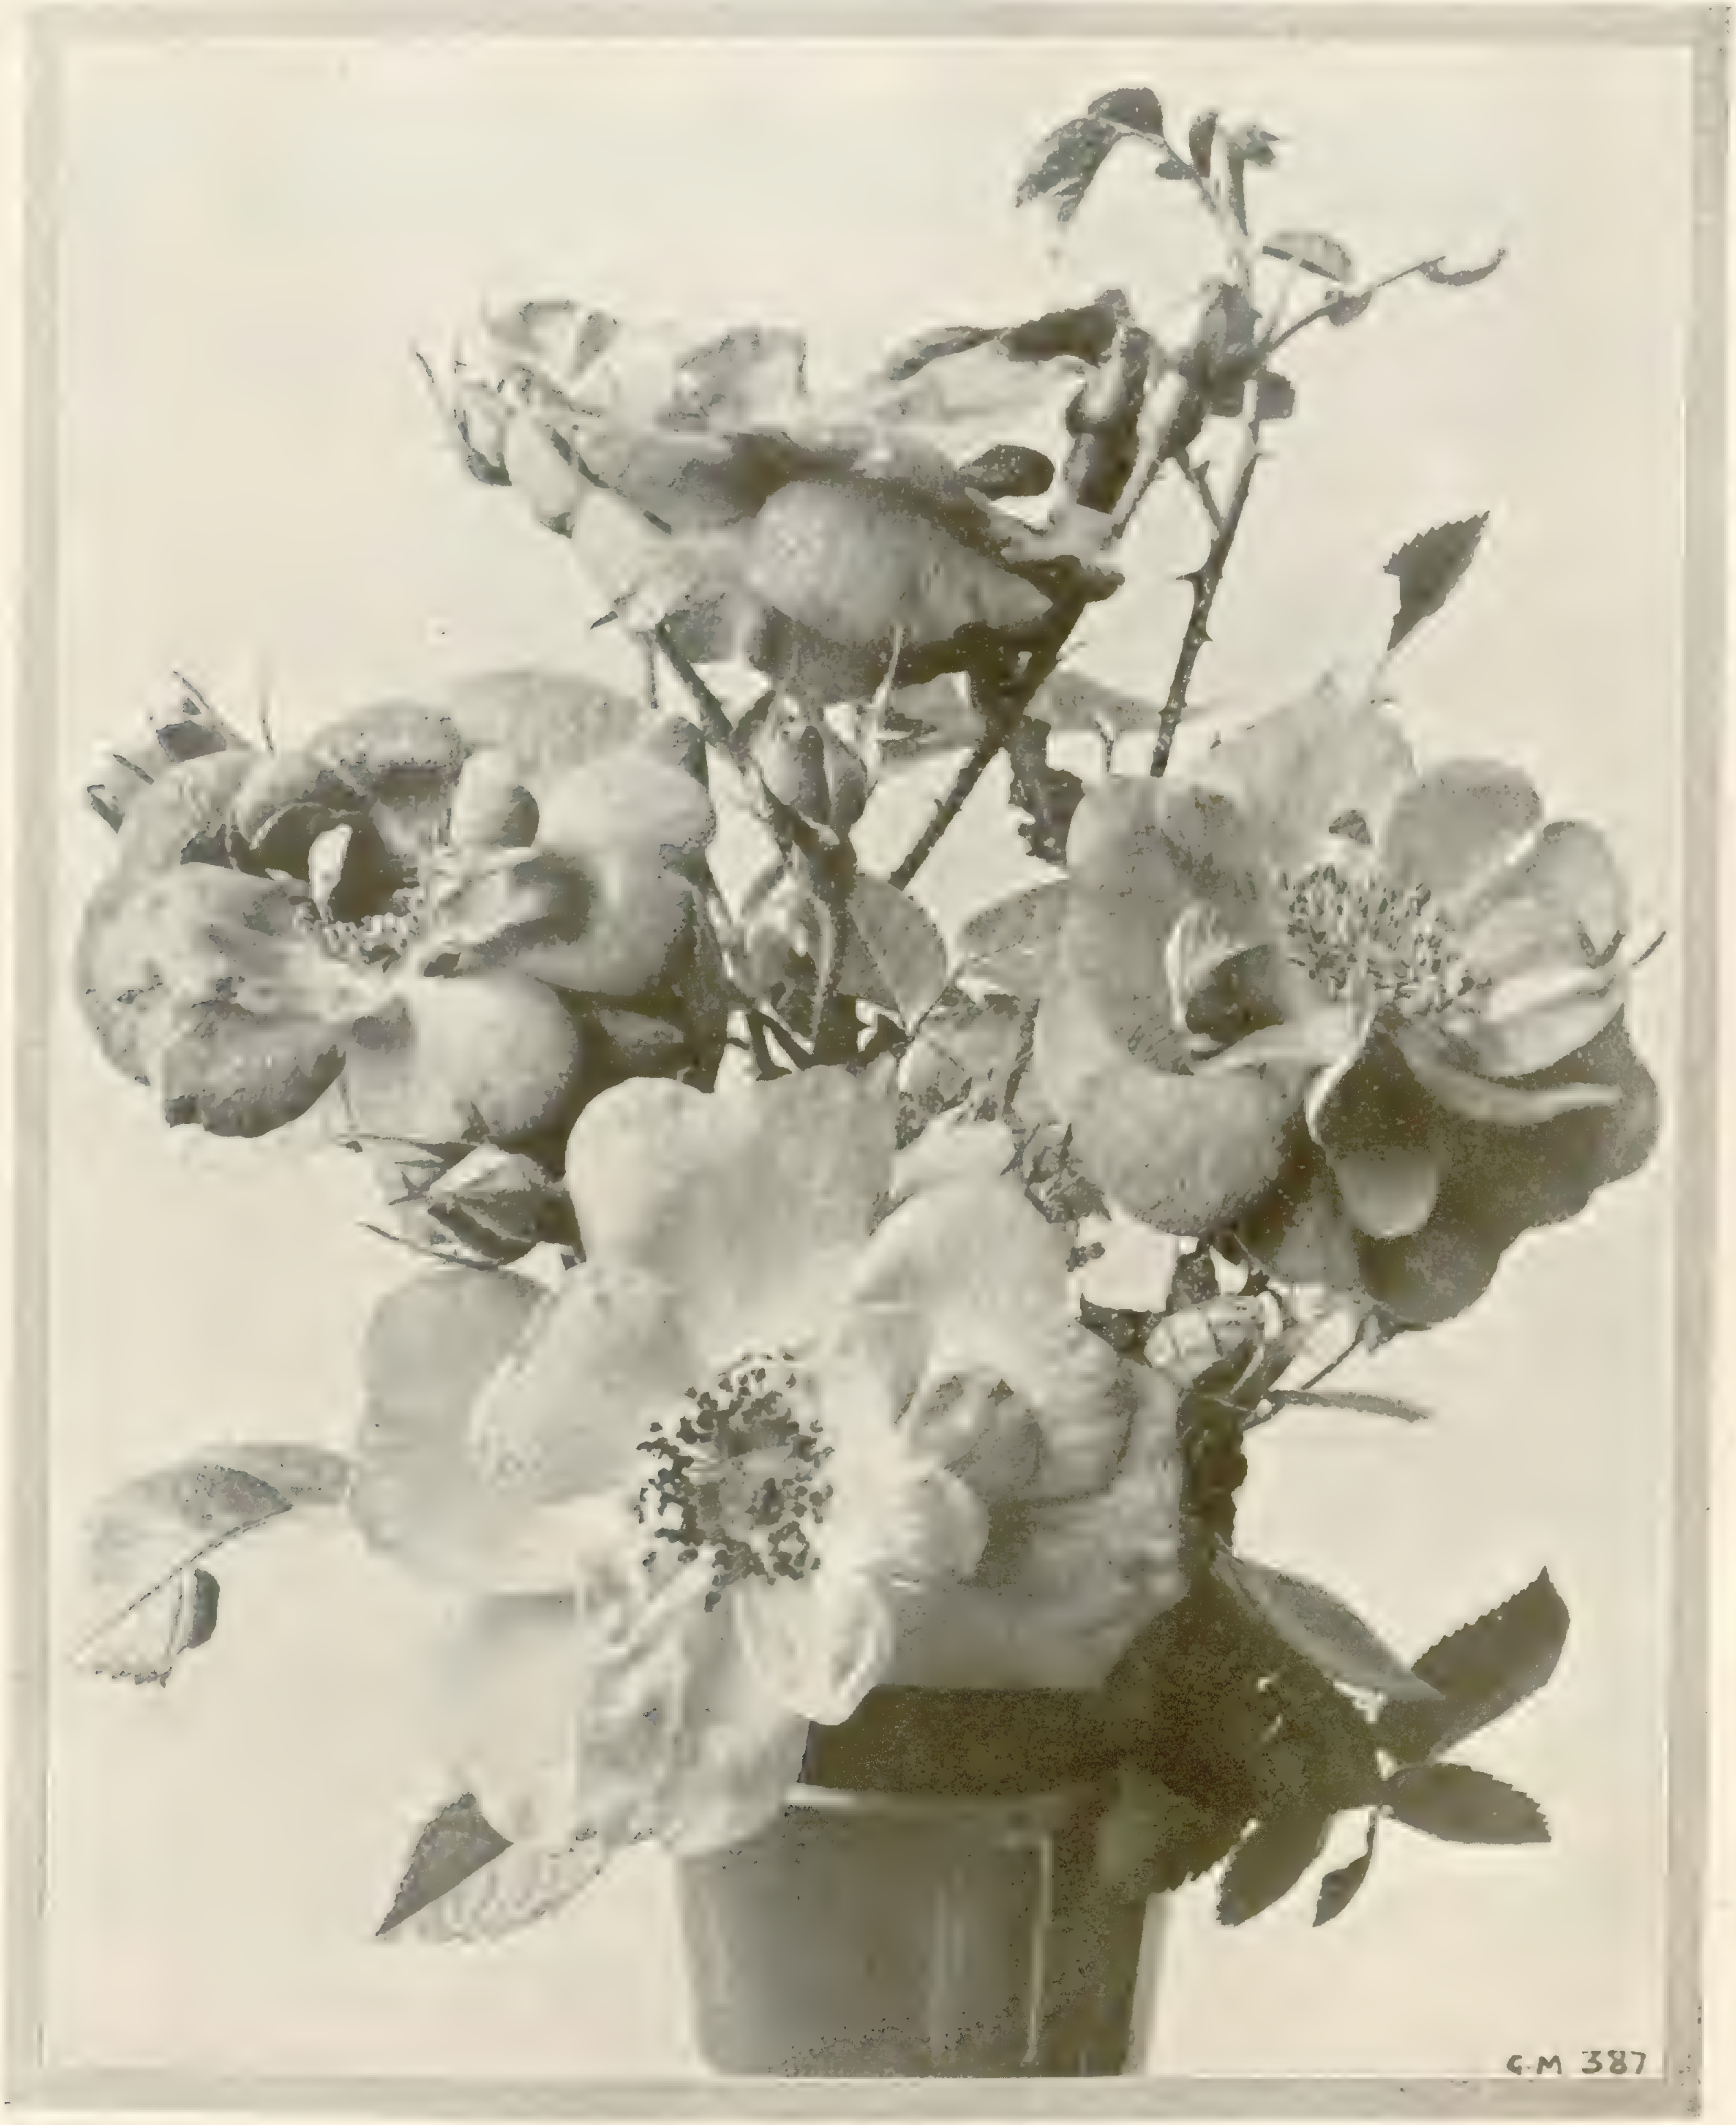
As July comes in we are still delighting in abundance of flowers, although the many beauties of the earlier season have passed to their rest for the year. Yet the slopes are aglow with blossom, and over the stones there creep many beautiful flowers as if they sought to show the superior charms of floral beauty when contrasted with the hardness and coldness of the mineral world. There are colours of almost all hues, and combinations of striking or harmonious effect. In truth, there is a superabundance of beauty for the pen to detail, and, as perforce, we must as usual select a few and leave others unchronicled or merely alluded to in a casual manner. Among the most beautiful alpine flowers of the times are the

Helianthemums or Sun Roses.

These are typical flowers of the season, and they enjoy to the full the bright and sunny days we have had, each morning opening to the dazzling sunlight their fugacious, crinkled, and beautiful flowers, which have all the glow of the true sun-loving blossom. It may be that they are short-lived, like our real summer, but then they are all so gloriously beautiful, spreading out into great sheets of dazzling or softest-coloured blossoms. Of the many I would notice now

Helianthemum polifolium roseum,

about which there seems some confusion in the minds of the trade and amateur growers. The one I consider the true plant (although I am always open to correction when evidence is submitted) is of rather erect growth, about six inches high, or at times a little more, and carrying a wealth of soft rose flowers, and, all in all, giving us one of the most beautiful of the genus. On the other hand, a plant is being sold as such which seems to have at least no claim to the name of "roseum," as it is more a combination of salmon and terra-cotta than a rose, while it is not an erect, but a spreading procumbent plant, although not to be despised by any means, and flowering most freely for weeks at a time. I have had this twice as H. polifolium roseum, both times, I believe, from the Continent, and although I cannot accept it as H. polifolium roseum, I am glad to own it, and to be able to enjoy its beauty as the years come round again.



NEW HYBRID BRIAR, REFULGENCE.

Blooms about three inches in diameter, semi-double, the colour brilliant crimson. Raised by Messrs. W. Paul and Son.

Allium Ostrowskyanum.

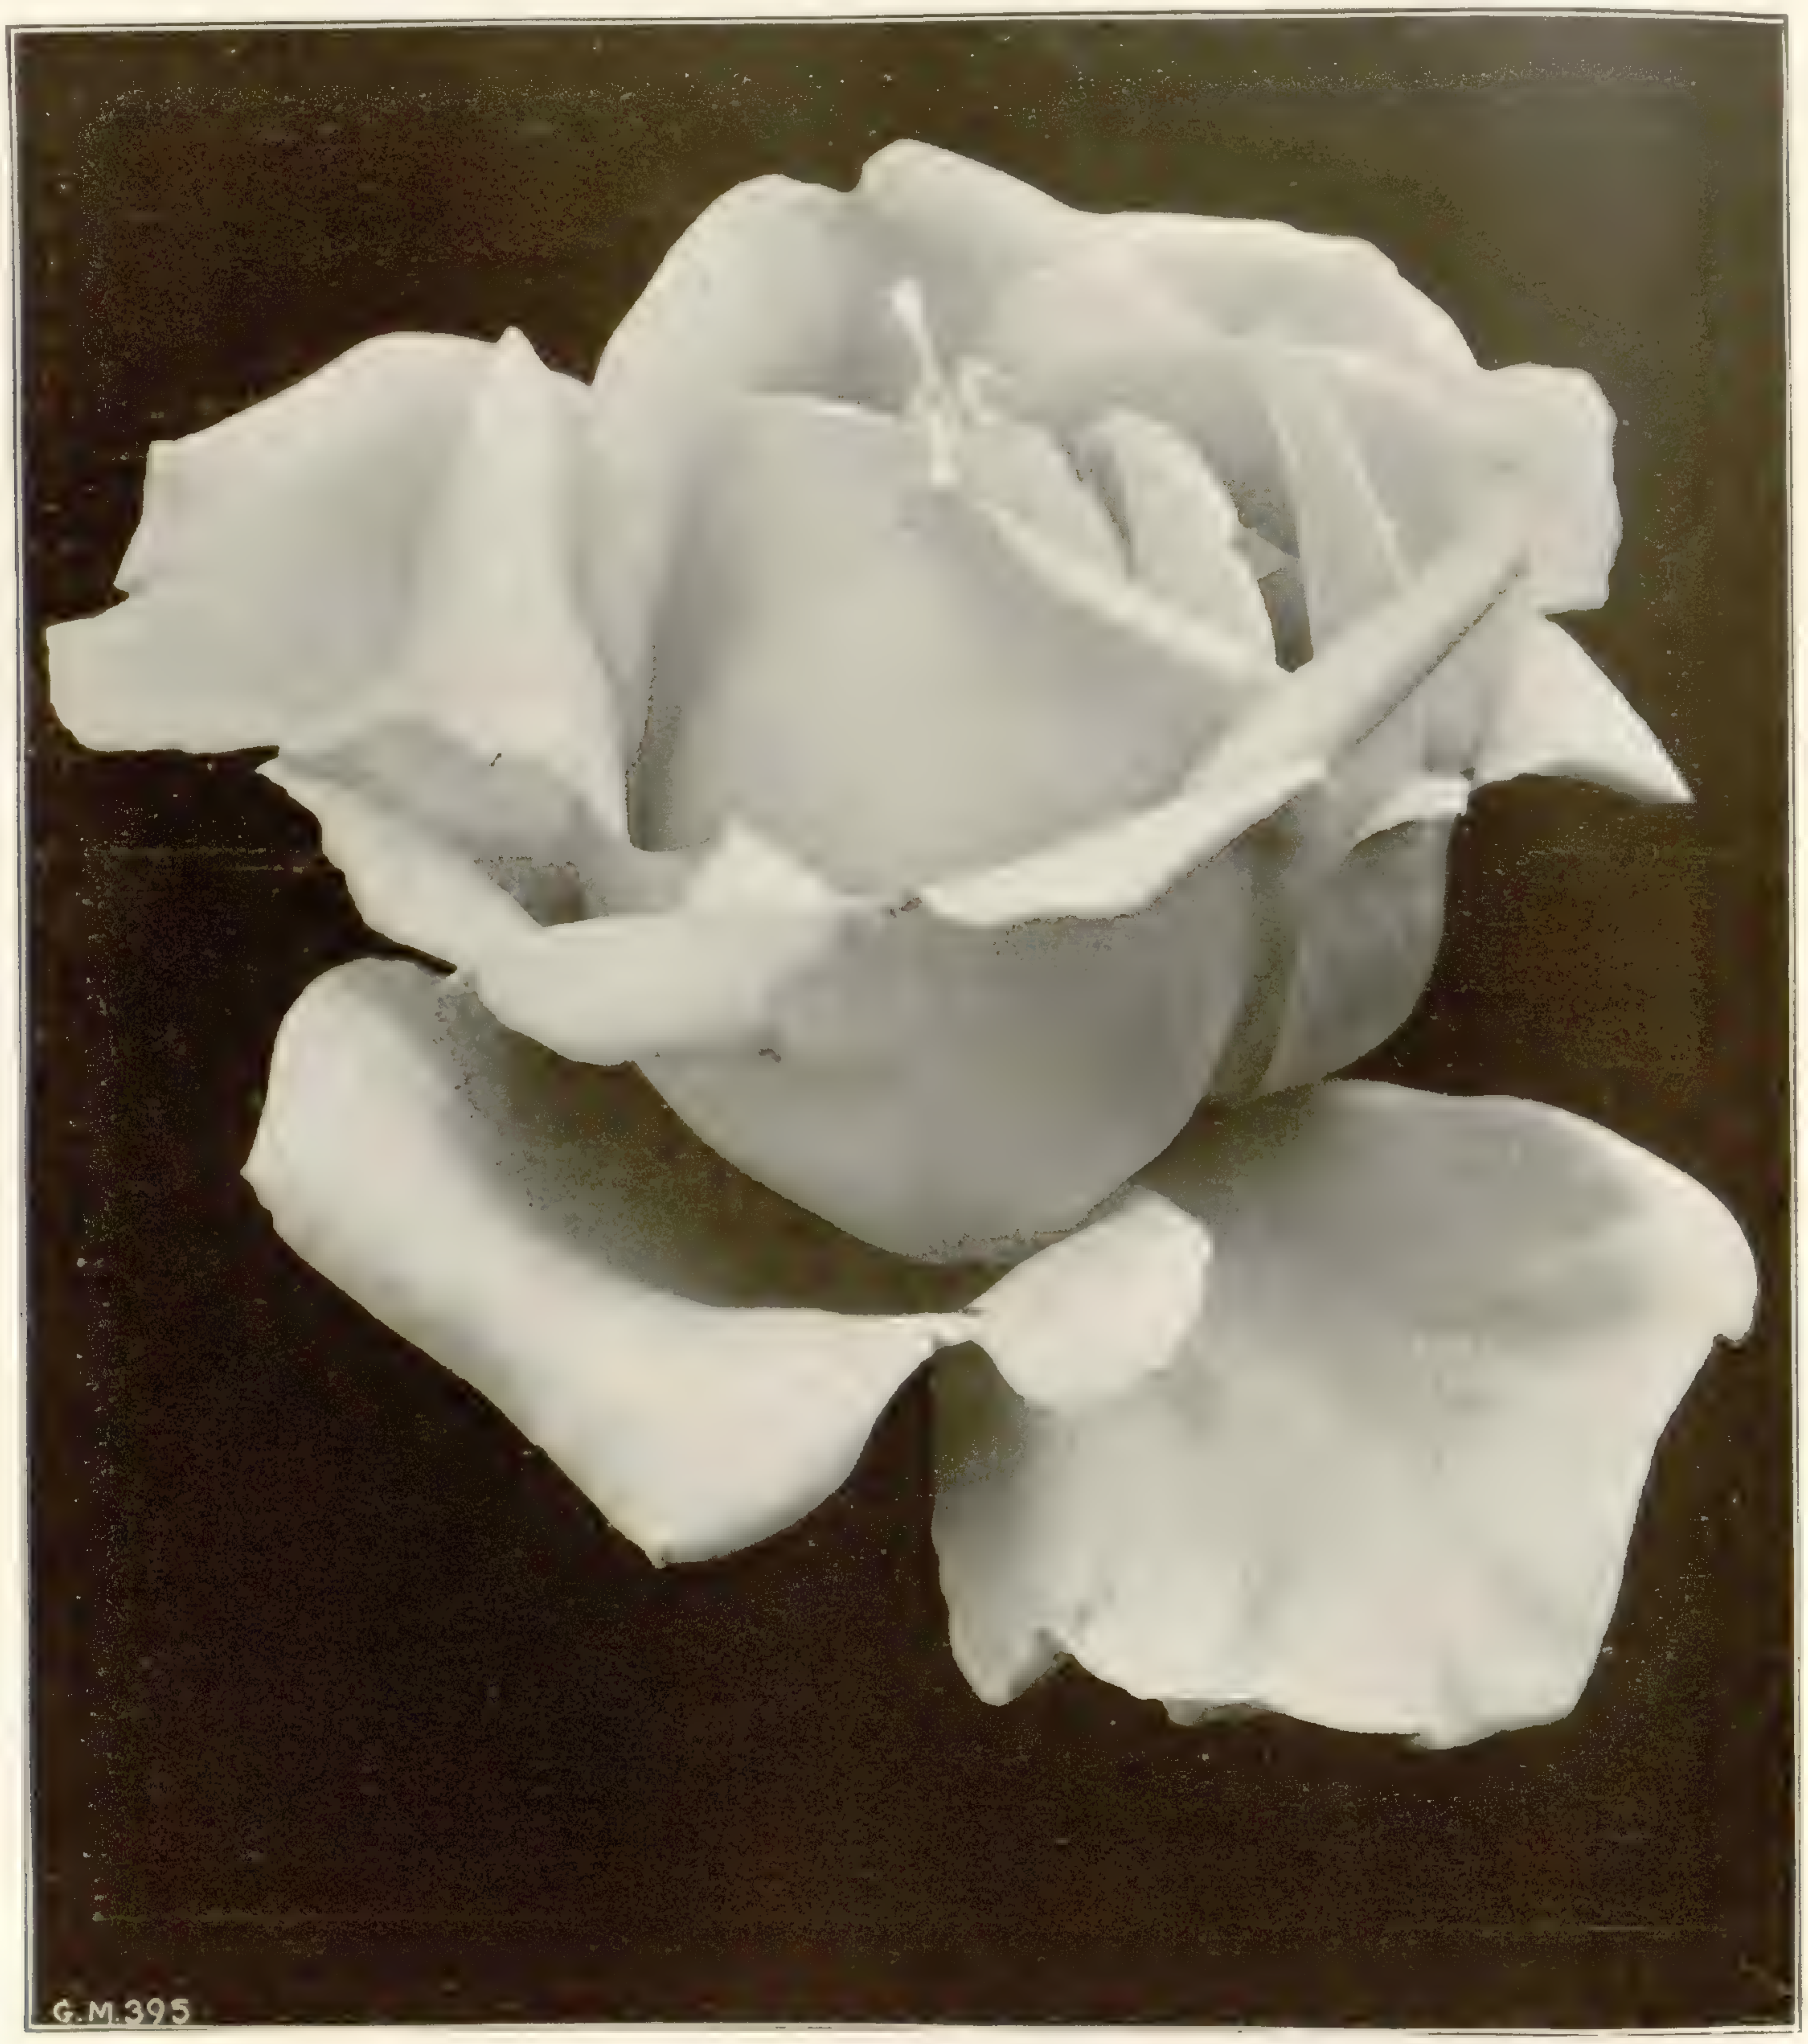
The garlics are always undeservedly under a cloud, but a little group of Ostrowsky's allium cannot well be passed over in silence, as it is not only a flower which has good features of its own, but is one which has a distinct claim to be considered effective and beautiful on the terraces or level plateaus of the rock garden. It has pretty rose-coloured flowers in a large umbel bearing many individual blossoms, and with a slightly drooping habit the heads of bloom hang over so as to reveal their beauty more to the observer than if they were quite erect. Its height is from six to twelve inches, but it is none the worse for being in poor soil, as here, so as to keep it dwarfer and making it more suitable for the rock garden. It is an excellent thing to carpet with some dwarf subject, such as a low-growing white alpine, through which the allium would spear and flower happily from year to year. It is one of the many flowers we now owe to Turkestan, whence it came in 1883, but it has never acquired popularity, probably because it is so little seen, for our summer-flowering bulbs are none too plentiful, and one such as this deserves attention. Planting is best done in autumn.

Campanula G. F. Wilson.

The bright, though deep blue, little bell-flower which bears this honoured name has from time to time caused discussion so far as regards the true plant, there being two bearing this name in cultivation and both named for that departed flower-lover, whose work formed Oakwood, Wisley, with all its beauties, now, happily, not lost and destroyed, but devoted to even greater usefulness in the hands of the Royal Horticultural Society. There is but little difference in the flowers of the two, and the main one lies in the leaves, those of one form having the foliage of a decidedly yellowish tint, the other having it of a good green. The confusion lies in their both having been raised and sent out under the same name by the raiser, the late Mr. Anderson-Henry, near Edinburgh, as C. G. F. Wilson, as they were of the same parentage and had the flowers practically the same. Both are beautiful; that with yellowish leaves is scarcely so vigorous as the other, but the contrast between the leaves and the flowers helps to heighten its beauty to some of us at least. It is a charming little flower only some three or four inches high, and having deep blue bells in some plenty raised a little above the leaves.

Dianthus strictus.

One of the troubles of cultivating a lection of plants with any regard for rectness of nomenclature is that of fying the names and "hunting up" "down" for the synonyms. This has exemplified with me in the case Dianthus strictus, which came to me as D. integer, a name still quite common nurseries and private gardens, and wh was at one time, at least, much familiar than the proper one of strictu In writing of it now I am doing so w the reservation that it is not brought forward as being better than its sisters of that delightful dianthus race to which it belongs, but as one which is in bloom; which is charming in its own way; and which I have not before written about in these pages. It is at present delighting in warm and sunny weather, and on a plant of fair dimensions there are many of its little pure white, beautifully fringed, slightly reflexed flowers. Like those of its sister-flower, the maiden pink, these are "of odour faint," and have not the perfume to the marked degree which exists in our double garden pinks. The flowers of Dianthus strictus charm us with their simplicity, elegance, and beauty. S. Arnott.



NEW HYBRID TEA ROSE, META WELDON.
Awarded Gold Medal, N.R.S. Exhibition. Colour, rich cream-yellow.

WINTER-FLOWERING SWEET PEAS.

It is fully evident that the value of the new American sweet peas has not been over-estimated, but rather that these most useful novelties are gaining rapidly in favour, and another winter will see them largely grown under glass in this country. As has been previously intimated, these sweet peas come into blossom early and give a continual succession of flowers, so that we can now regard the sweet pea (like the perpetual carnations) as an all-the-year-round product.

At the recent Boston (U.S.A.) Spring Show, these sweet peas were a noteworthy feature, and a special class was provided for them. The winning vases (of 100 spikes in each) were the white Florence Denzer and the popular Christmas Pink. Many other notable varieties were exhibited, and of these Mrs. Alex. Wallace, a good lavender, and W. W. Smalley, a satiny salmon-hued pink, were awarded first-class certificates.

As stated in a previous note, these sweet peas originated with Mr. Ant. C. Zvolanek, and I believe that some of his varieties will be seen in the Reading trials this summer, and should be in blossom in advance of our English sweet peas. With reference to the value of these varieties, I should hazard an opinion that they would prove profitable to follow on after late tomatoes or early chrysanthemums. If they are to follow on after the crysanthemums, they might be sown in pots a month before the time of planting, thus saving considerable time, and then as soon as the house or houses are cleared of one crop, the other crop is ready to take its place. One should bear in mind when making up beds for winter sweet peas that a good supply of nutriment should be present in the soil, and also see that the beds are made firm before planting.

As an instance of the continuous blossoming of sweet peas, I may briefly give the raiser's experience of Mrs. E. Wild, a bright carmine-red, which makes a wealth of stout growth and foliage. This was sown in the beds under glass on August 25, 1906, and the plants commenced to flower on October 16. From this time forward until June 5, 1907, a continuous supply of blossoms was given, a long enough period for any plants to produce flowers. Of course, some varieties will secure a greater amount of public favour than others, especially the whites and pinks, and in a lesser degree the reds and lavender shades. Sweet peas are so light in effect, and look so dainty when arranged in vases or made up into bouquets, etc., that the possibility of having a continuous supply the whole year through will give another fillip to sweet pea culture.

It must be borne in mind that there are other early sweet peas, in addition to the varieties of Mr. Zvolanek. The origin of some of these is of interest because the primary variety, Earliest of All, was a sport from Blanche Ferry (a well-known sweet pea of the older type). Earliest of All partakes much of the character of its parent, and true to its own origin, it gave a distinct and noteworthy break in Earliest White. From these two varieties, aided by cross-breeding and further sportive breaks, came the Telemby strain which has been brought into prominence by the Rev. E. Arkwright. These forms, whose chief merit is their early-flowering propensities, differ from our sweet peas in having narrower foliage and stems of a distinctly woody character.

But to revert to the Zvolanek varieties.

G.M. 394.

NEW TEA ROSE, MRS. CAMPBELL HALL.
Awarded Gold Medal N.R.S. Exhibition. Colour, rich cream-yellow ground, passing to bright rose-pink at the margin of the petals.

the raiser definitely states that his peas have been crossed with a species of vetch, and the presence of vetch strain has been demonstrated by the fact that they require more soil moisture and a cooler temperature than ordinary sorts, and also the tendrils and the narrow, harder leafage of the vetch has, to a certain extent been retained. The first notable variety of the group, Christmas Pink, is of the Blanche Ferry colour, but it is not quite apparent how it came into being. The notable white, Florence Denzer, sprang up, a chance seedling among a batch of sweet peas which had been crossed with Christmas Pink. Christmas Captain was obtained by crossing the Christmas Pink with Captain of the Blues, and it is of practically the same colour and form as the latter variety.

It is worthy of notice that the Zvolanek varieties are tall growers, and the raiser claims that the tall habit was acquired by crossing and recrossing aided by selection. As a contrast, it may be stated that Earliest of All grows about four feet high, while Watchung, a Zvolanek white, similar in form, grows nine feet in height, and the same may be said of the other varieties. There is one point about this tall habit. Provided one has sufficient space to permit of unrestricted growth, it should be possible to obtain a larger supply of blossom from them than from dwarfs.

Many Zvolanek varieties which at present are not in commerce will probably be put on the market at the end of the summer. Among them one will probably find Mrs. George Lewis, a giant white; Mrs. Hannay, cerise; Mrs. W. W. Smalley, satiny-salmon; and Miss Helen Gould, white and lilac. Among the most profitable of those already disseminated it is the bright, decided colours, and pure-hued paler forms which will be sought after. Six of the most popular for cutting would be Christmas Meteor, scarlet; W. J. Stewart, clear blue; Mrs. Alex. Wallace, lavender; Mrs. E. Wild, carmine-red; Florence Denzer, white; and Christmas Pink, all of which will give good results under sound treatment.

P. S. Hayward.

THE W. ATLEE BURPEE SILVER CHALLENGE TROPHY,
Offered for Waved Sweet Peas at the National Sweet Pea Society's Show, July 24, 1908.
Value Fifteen Guineas; Weight 50 Ounces.

HARDY PRIMULAS—No. II.

P. cortusoides is the parent of many varieties which are known in gardens under the name of P. Sieboldi. This species is deciduous and leaves no trace of its presence in winter. It spreads by means of creeping stems which soon cover a large area, the flowers range from white and crimson to lavender or mauve, and embrace many delicate and beautiful shades. It is generally in flower during May, and lasts in perfection for some time.

P. japonica is a vigorous and splendid species, producing rich crimson flowers in successive whorls, and the spikes, under liberal treatment, will often reach 30in. in height, while the rosettes of leaves frequently measure a yard across. It produces seed very freely, and a good strain can easily be degraded by the presence of inferior forms. To retain the purity of the stock all spurious colours should be vigorously weeded out before the pollen grains reach maturity.

Primula sikkimensis is an ideal bog primula, which produces in late summer abundant tall mealy stems, bearing lovely sulphur yellow, drooping blossoms, the leaves are deciduous, and the fresh growth is somewhat late in appearing, so that care must be exercised in marking its position. A species so effective from a colour point of view should be extensively planted, added to which the growth is refined, and it rarely proves an intruder like P. japonica.

Among the primulas specially suitable for rock gardens, none are more welcome than P. auricula, as the sweetly-scented yellow flowers are pretty, and the mealy leaves are effective even when the flowers are absent; second to auricula comes P. marginata, a species which plumps up great fat buds preparatory to unfolding the toothed leaves with their dense coating of white powder. The flowers are lavender or mauve, a shade which matches closely with the older forms of aubrietia. P. marginata is an easy plant to grow, its only fault in its becoming leggy with age, and w this takes place the plants should be lif and divided, leaving only the buds expo when replanting. P. viscosa, is a su deciduous species, bearing mage flowers; the foliage is light green and glu tinous to the touch. P. calycina is an eve green, with stout, pointed shining leave the flowers are large and of a pleasa purple shade, being borne in loose umb upon 6in. stems. P. calycina is a satisfa tory species to grow in any sunny chink or crevice, as it steadily increases in size and beauty each year.

P. Forbesi is the Bird's-eye primrose of the East; the slender stems, as well as the leaves, are densely mealy, and upon these the flowers are produced in successive whorls, the colour being a delicate shade of lilac-pink. Unfortunately, P. Forbesi is not hardy, but, being easy to raise from seed—which ripens freely—no trouble should be considered too great in retaining a good colony of this precious plant. P. pubescens alba is to the rock garden what P. rosea is in the bog, so freely are the chaste white flowers produced that, when intermingled with the light green leaves in some roomy crevice they form a picture complete in itself. P. pubescens alba is also known as P. nivalis in gardens, where it is more often grown as a pot plant. In the open it prefers a position not wholly exposed to sun, though it can never endure overshadowing by coarser growth. The plant is robust, and seems to prefer rich stony soil, with liberal supplies of water during the summer months.

The foregoing notes only briefly touch upon some of the best known of the hardy primulas, but sufficient has been said to show that none are without interest, but that most of them have a charm and beauty all their own, which deepens with closer intimacy.

Thomas Smith.

Walmsgate.

SWEET PEA JOTTINGS.

Whew! It is warm, in spite of the pleasant breezes, indeed, without them life in the south would have been scarcely bearable during the last fortnight. But the wind and sun together exert a very drying influence upon soil and vegetation, and those who did not dig deeply and have failed to mulch, water, and use the hoe are having a bad time of it.

What a remarkable difference there is in the habit of sweet peas. Some varieties never grow sturdily and vigorously; some are rampant; some flower much more freely than others; on some spikes of four and five flowers are common, while on others it is difficult to get more than three blooms, and twos are most frequent. Henry Eckford is a variety that has often been abused, especially by impatient folk; it seems necessary this sweet pea should have widespread roots ere it starts into good growth, and consequently when many varieties are beginning to "give out" Henry Eckford goes ahead, and gives a good autumn display—at least, that is my experience with it. Princess Victoria I like, not because I regard it as absolutely distinct, but because it gives me shapely four-flowered spikes without special feeding. Evelyn Hemus is one of the strong growers, but with me it was one of the latest to come into bloom, and even yet it has not developed its beautiful rosy-red edge properly. We all regret that Miss Hemus had such bad luck with her large autumn-sown crop of this novelty, weather and slugs combining to kill practically every plant. She has had to rely on spring sowings, and consequently her flowers are not so fine and early as last year.

Sweet peas are so forward, and have come along so quickly that the inspection of the Reading trials, and the outings of the National Sweet Pea Society have had to be arranged post haste, and are in progress as these lines appear. The three hundred rows at the University College Gardens, Reading, afford an unique opportunity of inspecting practically all the novelties of the season, and many that may be sent out next season, and they show how well or ill the varieties are fixed. The question of fixity grows more and more serious. Last year I saw breadths of certain varieties growing for seed, and these were wonderfully clean and true, and very little rogueing had been necessary. One would naturally conclude that such stocks would give seed likely to reproduce the variety truly, and yet, in some cases, it is doubtful whether there are 50 per cent. true. I am not going to name these varieties now, I await the report of the N.S.P.S. Floral Committee, but I would suggest that those really interested in the matter should join the Sweet Pea Society, and take advantage of the privilege of membership to visit the Reading trials.

I am sorry to learn that the streak disease has broken out in Ireland again. By this I do not mean that hundreds, scores, or even dozens of growers have reported attacks. My friend, Mr. H. J. Digges, of Donnybrook, reports that, in spite of every care and precaution, the disease has broken out badly in his garden. Although I am credited with a fair stock of patience and perseverance, I am sure my stock of these virtues would not permit me to annually attempt the cultivation of sweet peas, when, year after year, they fell a prey to a disease that baffles all attempts to cure or prevent it.

Now we are looking forward to the great exhibition on July 24, at Westminster. What kind of a show will it be? Even the most optimistic of us can hardly hope for so magnificent an exhibition as in 1907, but the size of the display will probably be as great, though the general quality may not be as high. Still, one never knows, and a few good rains will work wonders. The National Sweet Pea Society has added 204 new members to its list this year, and 24 new societies have affiliated with it, making a total of just over [illegible] members and 46 societies. There should be a keen competition for the Burpee Cup, which is a very handsome piece of silver presented by Mr. W. Atlee Burpee, who, I am sorry to hear, is on his way home, and so will not be with us on July 24, but he has promised to send Mr. Howard Earl, his right hand man, to see our show, and the new sweet peas. Mr. H. Mackereth, the great [illegible] from Ulverston; Mr. Hugh Dickson, of Newtownards; Comte d'Estienne, from Paris, and also one or two of the big German seed-growers, have all expressed their intention of being present at the show, consequently we may anticipate a good gathering of specialists, as well as of sweet peas.

Chas. H. Curtis.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

IMPORTED ORCHIDS.—There appears to have been a considerable number of late importations this season, and as these will have become generally distributed, some reference to their treatment may not be out of place. In the case of the cattleya family, I consider the sooner they are potted up the better. Carefully cut away all dead and decaying matter about the plants, and look out for any traces of the cattleya fly. It is a very risky business to place plants that show the least signs of attack from this and other pests in a collection of healthy cattleyas. I would, if space permitted, isolate all imported plants, and plants flowering for the first time, from the general collection of cattleyas, until satisfied that they are free from this pest. The traces of the fly may be easily detected by the perforations in previously made pseudo-bulbs. I would also advise that the plants be placed in as small pots as possible, and be potted up in practically all crocks, giving only a slight layer of potting compost or chopped sphagnum on the surface. They should also be kept shaded from strong light after being so long in the cases, as strong light causes the foliage to turn yellow and die. It is desirable to retain as much of the foliage as possible, therefore care in shading is necessary. The saturated condition of the atmosphere in orchid houses at this season is usually sufficient to keep the pseudo-bulbs plump, and little root moisture is necessary. It is advisable to spray the plants overhead once or twice a day.

CYPRIPEDIUM BELLATULUM and its allied species are also being extensively distributed. After the plants have been cleaned of any dead and decaying matter, do not disturb the crowns or matted roots more than is absolutely necessary. Pots should be selected that will contain the plants comfortably; fill these to about one-third their depth with clean drainage. The potting compost we find suitable for the whole of this section consists of about equal proportions of broken fibrous peat and turfy loam, with sufficient lime rubble and coarse sand intermixed to render the compost porous. This compost should be made moderately firm, and when potting is completed a thin layer of finely chopped sphagnum moss on the surface of the potting compost adds to the appearance of the plants. Water with rain water as soon as potting is completed, wetting the compost through. The temperature of a cool intermediate house suits these plants well during the summer months, but the warmer and drier conditions of the cattleya house are desirable for the winter months.

IMPORTED COOL ORCHIDS, such as Odontoglossum crispum and Cochlioda Noetzliana, should be placed in as small pots as possible. They usually suffer considerably from the hot, dry conditions of our houses when received in an imported state at this season of the year, but where small pots are used there is greater opportunity of frequent spraying overhead, which will assist the plants to regain a plump condition.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

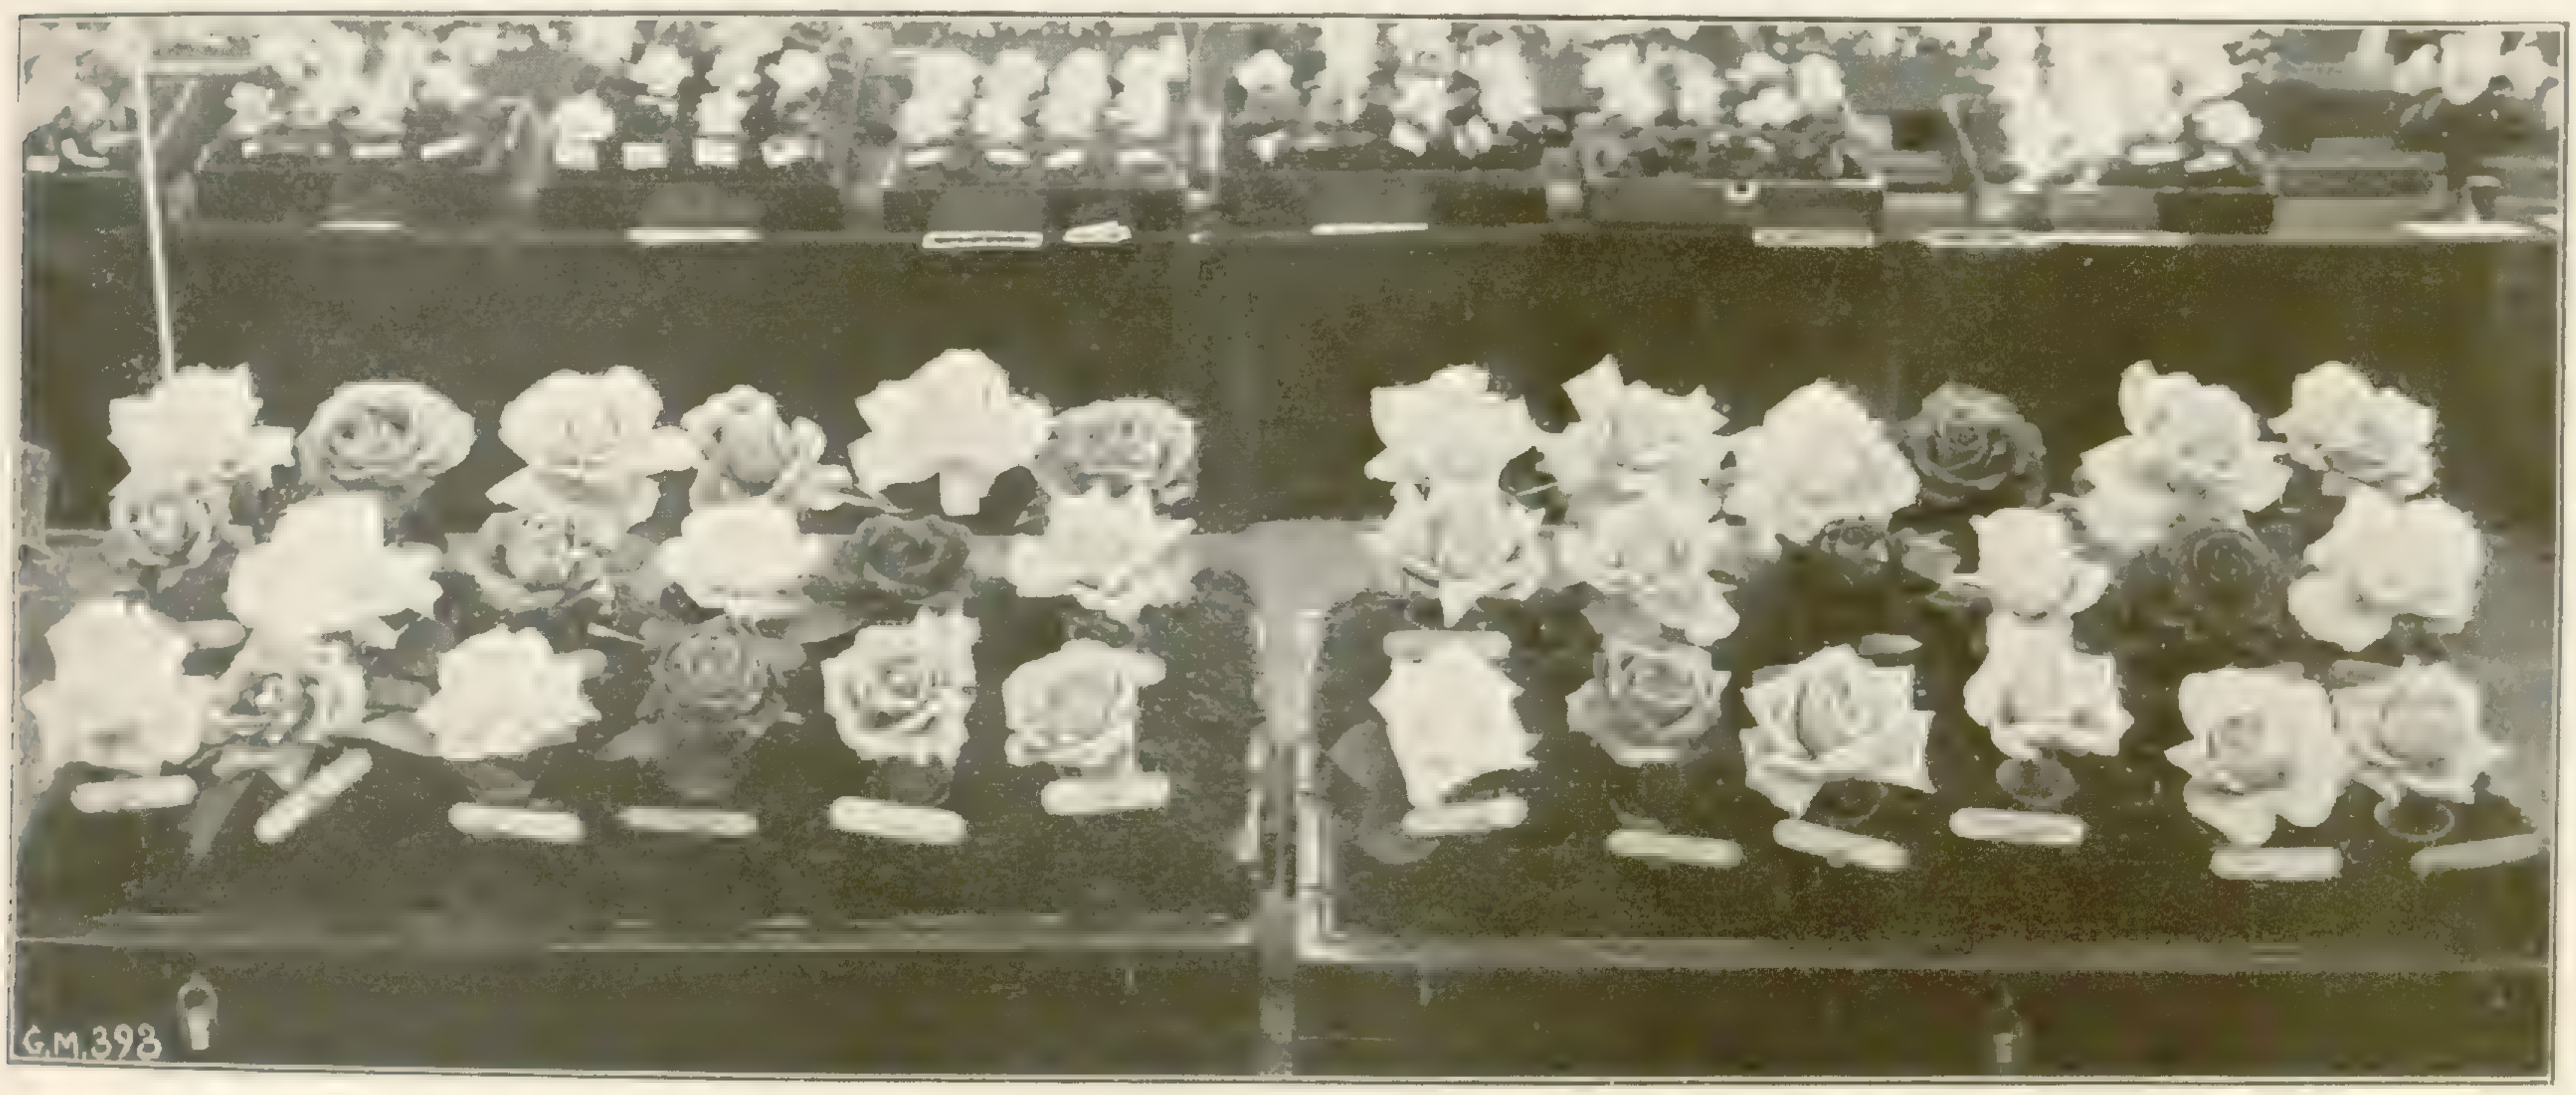
PERSIAN CYCLAMENS.—Now that growth is free plenty of air will be necessary. Shading, too, must be given in bright weather, and on very hot days it is well to damp the shading material. Greenfly is now very troublesome, and fumigation at regular intervals should be resorted to for keeping it in check. It is well to have the lights drawn off the frames at night so as to charge the foliage with moisture, which will help to sustain it in the more trying temperature of the day.

FUCHSIAS.—These have now a good start, and will be growing vigorously, and the stronger-growing sorts should be selected and given larger-sized pots. Judicious pinching and regulation of the growths must be well attended to if shapely plants are the object. Good rich soil, of which old mushroom bed manure should form a portion, should be given. Unless heavy rains prevail the plants should stand outside, but in such a position as to avoid the force of the wind, which soon works havoc with tender growth.

ASPARAGUS PLUMOSUS.—Young plants raised from cuttings and well rooted in small pots, should now have a shift into others two inches larger. These, if well grown, will be useful by autumn for either table or room decoration. Few plants are more useful in a small state, and they are readily raised and grown into a suitable size in one season.

GLOXINIAS.—Seedlings that are now in small pots, and are well rooted, may be placed in five-inch or six-inch pots. If the plants have been brought forward in gentle warmth they should be gradually hardened, and grown in a cool house or frame. The foliage of the plants must not be watered, but should be shaded from bright sunshine.

ADIANTUM CUNEATUM.—Plants are now growing freely, and if intended to yield fronds in the best condition in autumn and winter they should now be grown in a cold frame. If the plants have been shaded it will be necessary to give them light shade for a time, after which they may be exposed to the sun. It is only by exposure and abundance of air that fronds of the lightest green,



AMATEUR'S CHAMPION TROPHY COLLECTION OF THIRTY-SIX BLOOMS.
Exhibited by Mr. E. B. Lindsell at the N.R.S. Exhibition.

and those that will last when cut, can be produced. These ferns are frequently not shaded, and the fronds flag directly they are cut. Seedlings may now be placed in two and a-half inch pots, a very suitable size for many forms of decoration.

CAMPANULAS.—Seedlings of Campanula pyramidalis should now be ready for potting into five-inch or six-inch pots. The soil should be fairly rich to encourage strong growth. Continue to feed the plants coming into flower. Stake and tie any of the growths that are likely to get broken by heavy storms of rain or wind. Give liquid manure to the baskets of C. isophylla and its varieties, and if the slender growths cannot be allowed to hang down, support them with a few twigs from an old birch broom.—T. B. FIELD, Ashwellthorpe Hall Gardens, Norwich.

THE FLOWER GARDEN.

FLOWER BEDS.—Maintain a close watch on all flower beds, and where space permits give frequent hoeings; keep all absolutely free from weeds, and remove all dead leaves and old flower stems or seed pods.

TUBEROUS BEGONIAS will, on poor light soil, soon become exhausted if allowed to frequently become dry, therefore a mulching of cocoanut-fibre refuse or well-decayed leaf-soil would be very helpful. Tubs, vases, and raised beds must all be attended to in the same way.

COLLECTION OF FINELY-GROWN VEGETABLES AND MELONS

For which Messrs. E. Webb and Sons were awarded a Gold Medal at the Franco-British Exhibition.

WILD GARDEN.—Where grass has been allowed to grow long it should be cut at once, as all bulb foliage will have quite ripened off, and the extra warmth reaching the bulbs after the grass is cut will help to ripen and mature them. A general cleaning up all through the wild garden should be given, the grass being carefully cut from the sides of walks, and if the walks are at all green, dirty, or weedy, a dressing of weed killer should be applied, carefully guarding against its contact with anything else. Weed killer should only be given in quite settled weather, and the Knebworth watering can is the best medium to apply it with. All climbers rambling over or up the stems of trees must be attended to, directing their growths where most required; the beautiful Polygonum Baldschuanicum is one of the most suitable for this purpose, if given a light position. In corners where a summer effect only is required, and where it can be quite restricted, Polygonum cuspidatum is well suited; here it is quite a pest, some woods being almost covered with it. Epilobiums will, if planted, spread in the same way, and form beautiful masses of colour.

HARDY FERNERY.—Give similar attention here, guard against damage, and keep everything thoroughly clean and well watered.

BIENNIALS.—Wallflowers, campanulas, myosotis, calliopsis, and other biennials should now be pricked off as they become ready, and the ground well pulverised (but no manure added), and made firm. Prick out wallflowers nine to twelve inches apart each way, myosotis six inches, and other plants according to the size they will grow; give an open position, so that growth will be well ripened and hardened by the winter. All plants in the reserve garden should be well attended to. Recently divided daisies, primroses, and polyanthus; shrubs used for beds in winter, freshly propagated arabis, aubrietias, etc., must be carefully watched and attended to, proper attention now being well repaid in the following season's display. Young growths from the base of hollyhocks may not be rooted by inserting them singly in sandy soil in small pots, and standing or plunging them in cold frames, preferably with northern aspect; keep them close and well shaded until rooting commences, when air may gradually be given. Should the dreaded disease appear in established plants, remove and burn all dead leaves, syringing others with one of the approved fungicides.

HERBACEOUS BORDERS.—Pæonies have again given of their wealth, and proved their value for cut blooms as well as for border decoration. Inula glandulosa, heucheras, saxifragas, iris, campanulas, etc., give pleasing variety, being followed by Chrysanthemum maximum, delphiniums, phloxes, and a host of others. See that nothing is damaged through want of support; plants may be apparently standing erect and safe, but a heavy storm or strong wind will sometimes irreparably damage them in a few minutes. Anything transplanted late in the season will need watering and mulching, and probably none of them will reach their usual height this season; but if allowed to remain another year will regain their full height. The earliest flowering varieties of chrysanthemums will soon be producing their buds, and must be carefully attended to, and should flowers of a maximum size be wished for, disbudding may be practised; but the greater charm is found in allowing the earliest varieties to produce their full number of blooms. Liquid manure may be given, and they must be staked or supported.—E. F. HAZELTON, Knowsley Gardens.

HARDY FRUITS.

FIGS.—These trees need attention at intervals, and some of the weak, useless shoots may be removed, cutting them back to within a few eyes of the base, but the more fruitful wood should be retained and made secure to the walls or older branches. If the borders are firm, and there is ample room for extension, the growth ought to be stout and firm, as it is from this class of growth the figs are most plentifully produced. Fig trees require but very little pruning, and in favourable chalky parts of the country fine crops are almost annually produced. Brown Turkey is one of the best, although I have seen very fine fruits of the Brunswick near Margate and along the Thanet coast. When the fruits show signs of ripening they must be protected from birds, either by netting the trees over, or using small muslin bags just large enough to cover each fruit. The roots need a few heavy soakings of water should the trees be bearing heavy crops, and the syringe must be freely used in the afternoon in warm, sunny weather, otherwise red spider may put in an appearance. Young trees, if making much wood, need not be watered, but must be kept neatly trained. In the case of fruiting trees, the shoots bearing fruit may be stopped at a few leaves above, so as to throw all the strength possible into the fruit.

GOOSEBERRIES.—If fine fruit is wanted a few applications of liquid manure should be given; in any case, the soil under the bushes will be all the better if covered with manure and a little strawy material to keep the fruits clean and free from grit. Cordons will need attention, stopping some of the shoots to avoid overcrowding; those on walls are very liable to attacks of red spider, so that a few good syringings with clear water at intervals will be helpful in maintaining a clean, healthy leafage.

RED CURRANTS must be protected early, otherwise most of the fruit will be taken by birds while quite green, and the same may be said of black currants. Our crop is very light this season, as many of the fruits dropped after the severe late spring frost and snow.

SUMMER PRUNING.—Plums and pears on walls, etc., should receive attention in the matter of summer pruning. Do not cut the shoots too far back this time, otherwise the buds at the base may break into growth. I usually cut back to about the fifth leaf when pruning early. Preserve young pieces of new growth at intervals, especially in the case of greengages, as these may be nailed to the walls between the older branches. Keep a sharp look-out for aphides, and should they attack the leaves, syringe with quassia extract. If the crops are heavy, thin the fruits; the Victoria plum is bearing heavily, and when the fruits are large enough some may be used for tarts while quite green. Do not forget to examine the roots of newly-planted trees, and give water if required; mulching must not be overlooked. Apples are bearing heavy crops, and on the whole the trees are looking very promising.—H. MARKHAM, Wrotham Park Gardens.

Hardy Border Flowers.—Many early-flowering plants have passed out of bloom, and others will rapidly follow, so remove all old flower stems as they ripen off. Trollius, doronicums, aquilegias, pæonies, Oriental poppies, etc., have finished their display for the season, and if there is nothing adjacent to continue the display, annuals of suitable heights may be planted. Continue to stake and support all plants needing it, but guard against tying them too closely or tightly. Those that have not been transplanted for a season or two, and have become rather large, impoverishing the ground around them, must not be allowed to suffer from drought; a liberal sprinkling of an approved chemical manure well watered in will be very helpful to them. Do not allow underground spreading subjects, such as alstromerias, Anemone japonica, Helianthus rigidus, epilobiums, and others to occupy more than their allotted space. Keep close guard against damage by caterpillars and slugs. Lay lettuce down early in the evening, especially after watering, and examine them later on, when many slugs may be caught. Caterpillars should be searched for and picked off by hand.—LANCASHIRE GARDENER.

EXHIBITIONS AND MEETINGS.

◆

National Rose Society.

Patronised by Her Majesty the Queen, and Princess Victoria; held on the brightest and hottest day of a fine run of beautiful summer weather; situated in one of the most rural spots in London—the Royal Botanic Gardens; attended by what must have been a record crowd; and with an overwhelming abundance of beautiful roses on view, it is small wonder that the National Rose Society's Metropolitan Show, held on Friday, July 3, was in every way a huge success. So successful was it in attendance and weather that, in spite of the cooling (artificial) showers that ever and anon fell on the canvas roofs of the four big tents, the heat was so great that only those who were present at or before the opening hour saw the blooms in their beauty. Long before our representative finished his survey of the display the beauty of the show had fled; indeed, in some cases flowers had drooped ere the judges commenced their duties. But it was a grand show, worthy of a flourishing society.

NURSERYMEN.

The first competition to which rosarians hurry, after, of course, they have discovered how their own blooms have fared, is the one for the Champion Trophy, open to nurserymen. The fight for this trophy is always a keen one, and the blooms are always worthy of inspection. This year there were six competitors, and the coveted award was won by Messrs. D. Prior and Son, Colchester, who had a superb set of bright, clean flowers, and whose leading varieties were Wm. Shean, Marchioness of Londonderry, White Maman Cochet, Dean Hole, Alice Lindsell, Bessie Brown, Frau Karl Druschki, Horace Vernet, Mildred Grant, J. B. Clarke, Killarney, and Caroline Testout. Second prize fell to Messrs. Harkness and Co., Hitchin, and third to Messrs. B. R. Cant and Sons, Colchester.

For forty varieties, three blooms of each, Messrs. Ben Cant and Sons, Colchester, secured the chief honours from four other competitors with a stand that contained excellent examples of Maman Cochet, Ben Cant, Lohengrin, Alice Lindsell, and Caroline Testout; Messrs. Alex. Dickson and Sons, Newtownards, a good second, and Messrs. D. Prior and Son, Colchester, third.

In the second division of the nurserymen's general section, the premier position in the class for forty-eight blooms, distinct, was won by Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, from seven other competitors, with a set that had specially notable blooms of Florence Pemberton, Bessie Brown, Muriel Grahame, Ulrich Brunner, Gustave Piganeau, Mildred Grant, Dean Hole, Mdme. C. Soupert, and Mrs. Dudley Cross; Messrs. G. and W. H. Burch, The Rose Gardens, Peterborough, came second, and Mr. G. Mount, Canterbury, was third. Mr. Hugh Dickson was awarded an extra third prize. In the same section Mr. H. Drew, Faringdon, Berks, led for a box of twenty-four blooms, distinct, with another beautiful and even set of blooms, in which Hugh Dickson, Mrs. T. Roosevelt, Ulrich Brunner, Comtesse de Nadaillac, and Dean Hole, figured well. Mr. Charles Turner, Slough, second, and Mr. E. J. Hicks, Twyford, Berks, third, seven competitors.

The best set of sixteen varieties, three blooms of each, was shown by Messrs. G. and W. H. Burch, Peterborough, with a really fine set, in which were Mrs. T. Roosevelt, Dean Hole, Mildred Grant, Mdme. Jules Gravereaux, Her Majesty, Caroline Testout, and Florence Pemberton. Messrs. Burrell and Co., Cambridge, came second, and Messrs. J. Jefferies and Son, Cirencester, came third. There were seven competitors.

NURSERYMEN'S TEAS AND NOISETTES.

The D'Ombrain Challenge Cup for tea and noisette roses is for twenty-four blooms, distinct, and the winner is regarded as the tea-rose champion. There were four competitors, the winner being Mr. George Prince, Longworth, Berks, who had fine bright examples of Souv. de P. Notting, Princess of Wales, White Maman Cochet, Maman Cochet, Mrs. E. Mawley, Marechal Niel, E. Veyrat Hermanos, Mdme. Berger, Mdme. J. Dupuy, Innocente Pirola, Mdme. Jules Gravereaux, Mdme. Cusin, and Mdme. C. Soupert; Messrs. B. Cant and Son, Colchester, second, and Messrs. Frank Cant and Co., Colchester, third.

The best twelve tea or noisette roses, distinct, came from Mr. John Mattock, Headington, Oxford, whose varieties were White Maman Cochet, Cleopatra, Boadicea, Medea, Catherine Mermet, Innocente Pirola, Empress Alex. of Russia, Muriel Grahame, Maman Cochet, Mdme. C. Soupert, Mdme. Jules Gravereaux, and Bridesmaid; Messrs. Paul and Son, Cheshunt, second, and Messrs. J. Burrell and Co., Cambridge, third.

An interesting class is the one for fourteen tea or noisette varieties, three blooms of each, shown in vases, on a space not exceeding 5ft. by 3ft. The set staged by Messrs. B. R. Cant and Sons was placed first, and it included White Maman Cochet, Madame Jules Gravereaux, Edmond Proust, Catherine Mermet, and Souv. de Pierre Notting; Mr. H. Drew, Faringdon, second; and Mr. G. Prince, third.

ROSES IN VASES.

For a dozen varieties of roses, not more than six tea or noisette varieties, seven blooms of each, arranged in vases, there were six entries, and Messrs. A. Dickson and Sons, Newtownards, took the lead with a finely set-up lot of Bessie Brown, Mildred Grant, Dean Hole, Grace Molyneux, Ulster, Frau Karl Druschki, Lady Derby, Lady Ashtown, Florence Pemberton, and Marquis Jean de Chas. Paigner; Messrs. D. Prior and Son, Colchester, second, with lovely flowers; and Messrs. Frank Cant and Co., Colchester, third. In the class for nine distinct tea or noisette roses, seven blooms of each, set up on a space 5ft. by 3ft., there were four competitors, Mr. Henry Drew, Faringdon, Berks, scoring with good blooms, fairly well arranged, of Madame Cusin, White Maman Cochet, Medea, Mrs. S. Tresider, Mrs. E. Mawley, The Queen, Maman Cochet, and Muriel Grahame; Mr. J. Mattock second, and Mr. G. Prince, Longworth, Berks, third.

MRS. ORPEN'S FIRST PRIZE BOWL OF DECORATIVE ROSES, N.R.S. EXHIBITION.
The variety is the bright pink single damask Mrs. O. G. Orpen.

DECORATIVE ROSES.

In this section all H.P.'s, except singles, and all exhibition roses, are excluded.

The nurserymen made, as usual, a fine display, though they permit formality of arrangement to reduce the beauty of their flowers. The class for thirty-six varieties induced only two competitors to come forward, and premier position was accorded to Mr. J. Mattock, Headington, Oxford, for a fine lot of blooms of Irish Glory, Belle Fleur, Lady Battersea, Hebe's Lip, Papillon, Madame Abel Chatenay, Claire Jacquier, Leuchtstern, etc. Messrs. Paul and Son, Cheshunt, secured the second award.

The displays of eighteen decorative roses were of interest, and there were six of them. Messrs. W. Spooner and Son, Hounslow, led with goodly bunches of Rubens, Gustave Regis, Allan Ramsey, etc.; Mr. Charles Turner, second; and Mr. J. Barrow, Oadby, Leicester, third. For eighteen summer roses, arranged on a space 4ft. by 4ft., Mr. George Prince, Longworth, led with a very pretty set of Mrs. F. W. Flight, Rubens, Crimson Rambler, Himalaica, Wallflower, etc., set up in pyramidal fashion; Messrs. G. Cooling and Sons, Bath, also had Mrs. F. W. Flight in fine form, and were second; Messrs. Paul and Son, Cheshunt, third.

Mr. John Mattock won first place for a set of eleven varieties of decorative roses, not less than three sprays of each, showing Prince de Bulgarie, Irish Elegance, Crimson Rambler, Lady Battersea, Leuchtstern, Madame Abel Chatenay, and Helene, finely; Mr. George Mount, second; and Messrs. J. Jefferies and Son, Cirencester, third.

GROUPS OF ROSES.

The first prize, including a gold medal, for a representative group of roses, staged on the floor, on a space of 250 sq. ft., was won by Messrs. Hobbies, Lim., Dereham, who had an imposing and attractive exhibit, composed chiefly of pillar and standard plants of Hiawatha, Dorothy Perkins, and other rambling roses, faced with baskets and vases of tea and hybrid tea roses. Messrs. Paul and Son, Cheshunt, were placed second, with some fine masses of rambling roses and Wichuraiana varieties, baskets of cut blooms of H.P's., H.T's., and T's.

The class for a group of cut roses, arranged on staging and occupying 100 sq. ft., was more enticing, as here there were five competitors. Mr. George Mount, Canterbury, was an easy first with a bold and beautiful exhibit, in which the great features were the pyramids of Mrs. J. Laing, Richmond, Joseph Lowe, Frau Karl Druschki, Helene, and other striking varieties. Mr. F. M. Bradley, Church Street, Peterborough, second; and Messrs. W. and J. Brown, Peterborough, third. Messrs. W. Spooner and Son, Hounslow, gained an extra prize.

A class was provided for arches decorated with long sprays of roses, and there were numerous entries. The successful exhibitors were Messrs. Paul and Son, Hobbies, Lim., and Mr. G. Prince.

OPEN CLASSES.

Messrs. R. Harkness and Co., Hitchin, were first for a crimson rose, eighteen blooms, in a bamboo stand, with Ulrich Brunner; Messrs. B. R. Cant and Sons, second, with the same variety; and Mr. Hugh Dickson, Belfast, third. For eighteen blooms of a white or yellow rose, similarly shown, Mr. J. Mattock, New Headington, led with Bessie Brown; Messrs. R. Harkness and Co., Hitchin, second, with Florence Pemberton, and Mr. Hugh Dickson third. For eighteen roses, other than a white, yellow, or crimson, in bamboo stands, Messrs. Frank Cant and Co. led with superb examples of what appeared to be Lady Moyra Beauclerc; Messrs. S. Bide and Son, Farnham, second, with Queen of Spain; and Mr. Hugh Dickson, Belfast, third.

The best dozen blooms of White Maman Cochet came from Messrs. Frank Cant and Co., Colchester, and they were a beautiful set; Mr. Chas. Turner, Slough, second; and Messrs. B. R. Cant and Sons, third. For twelve blooms each of Frau Karl Druschki and J. B. Clarke, arranged alternately, there were ten entries; Mr. George Mount, Canterbury, was first with grand examples; Messrs. G. and W. H. Burch second; and Messrs. Frank Cant and Co. third; this was an attractive class.

NEW AND GOLD MEDAL ROSES.

Messrs. A. Dickson and Son, Newtownards, had the best nine blooms of a new rose, showing William Shean in good form; Messrs. F. Cant and Co. second with Mrs. T. Roosevelt; and Messrs. S. Bide and Son, Farnham, and Messrs. B. Cant and Sons, Colchester, were placed equal third, the former with Queen of Spain, and the latter with Mrs. Theodore Roosevelt. Messrs. F. Cant and Co., Colchester, led for twelve new roses with Mrs. T. Roosevelt, Mrs. J. Bateman, Yvonne Vocherot, Wm. Shean, J. B. Clarke, Mdme. C. Soupert, Countess of Gosford, Mrs. Tyler Kennedy, Queen of Spain, Countess de Saxe, Frau Ernest Borsig, and Pie X.; Messrs. B. Cant and Sons, second; and Messrs. A. Dickson and Sons third.

Messrs. Alex. Dickson and Sons, Newtownards, gained a gold medal for Meta Weldon. a globular, bright cream-coloured variety of great depth and beauty. Dr. J. Campbell Hall, Rowantree, Monaghan, was awarded a gold medal for a cream, pink flushed, sweet tea rose, with very broad petals, named Mrs. J. Campbell Hall.

A card of commendation was awarded to Messrs. Paul and Son for Shower of Gold, a neat flower, something in the way of Alister Stella Gray. A similar award fell to Mr. Hugh Dickson, Belfast, for W. R. Smith, a full, broad-petalled, creamy rose, tinted with pink, probably a H.T. From Messrs. A. Dickson and Son came an unnamed tea rose, a globular blush variety, that gained a card of commendation, as also did this firm's Grace Molyneux, a deep cream pink variety, very fragrant. Messrs. McGreedy and Son, Portadown, Ireland, secured a card of commendation for Earl of Gosford, a rather thin, but very bright and pretty rose-red, H.T.

OPEN DECORATIVE ROSES CLASSES.

Messrs. G. Cooling and Sons, Bath, scored for single roses, twelve kinds, with a pretty set of Lady Curzon, Paul's Single White, Andersoni, Stella, Himalaica, and Polyantha grandiflora; Messrs. Paul and Son, Cheshunt, second. The best dozen roses of the beautiful Mdme. Abel Chatenay came from Mr. George Mount, who grows this variety so well; Messrs. W. Spooner and Son, Hounslow, second; and Messrs. D. Prior and Son, Colchester, third. Wiring was too obvious in many cases.

AMATEURS.
